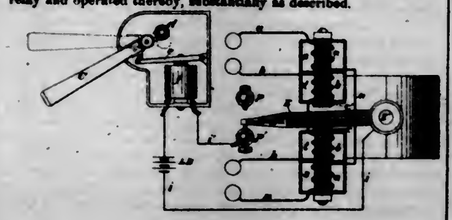
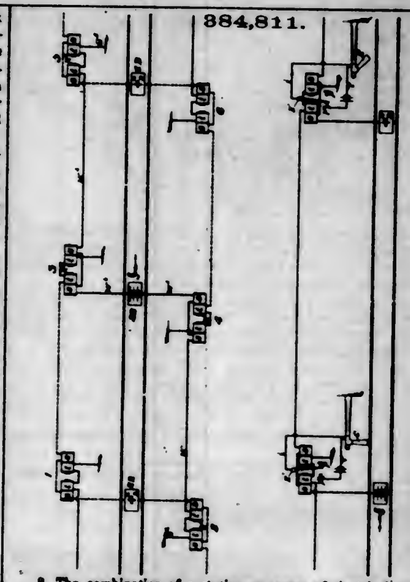
4. In a block-signal system for railways, the combination, with a source of electrical energy, of insulated rails forming part of or placed near to the railroad-track, four differentially-wound polarized relays, two at adjoining stations on one side of the track and two at adjoining stations at the other side, connected together, excepting between the rails of the track, by a line wire or wires connected with one or other of the coils of each relays, according to the relative direction in which the signal at each station is to be operated, a local battery and circuit at each station, the circuit of which is made or broken by the armature of the polarized relay, and an electrically-operated signal at each station, the same being arranged and operated substantially as described.

5. The combination, with the line-wires of the circuits of a railroad-block-signal system, and with a battery or batteries, of differentially-wound polarized relays arranged in connection with the electrically-operated block-signals and the local battery and circuit thereof, substantially as described, and so that each signal may be automatically operated in different directions, according as the line-wire is connected with one or other of the coils of the relay and according to the name of the current (whether positive or negative) that is passed over the circuit, substantially as described.



6. The combination of a differentially-wound polarized relay having an armature pivoted at one end and extending between the poles of the relay, and having the other end located between contact-points to make and break the local battery-circuit, a local electro-magnet, and block-signal operated mediately or immediately by the armature thereof, substantially as and for the purposes described.

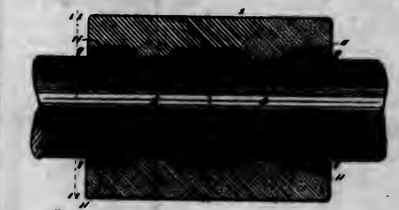


7. The combination, with a battery located on the locomotive, tender, or other car of a train, of two pairs of metallic brushes or contacts mechanically connected with such car, so as to be movable to and from contact with the rails of the track, one brush of each pair being electrically connected with the positive and the other with the negative pole of the battery, and furnished with intermediate gearing for bringing one brush of each pair, having opposite signs, into contact with the opposite rails of the railroad-track, respectively, and for reversing them at pleasure by moving the lever in one direction or the other, and thus changing the direction of the electric current, substantially as described.

8. The combination, with a battery located on the locomotive, tender, or car, of metallic brushes or contacts connected, respectively, with the positive and negative poles of the battery, the lever for reversing the engine of the locomotive, and levers interposed between and connected with said brushes and reversing-lever and capable of operating the brushes to bring alternately the positive and negative pole brushes in contact with the rails of the track, substantially as described, so that the engineer, when reversing his engine, shall also reverse the direction of the electric current to operate the electric block-signals in the manner hereinbefore set forth.

384,811. APPARATUS FOR OPERATING AUTOMATIC BLOCK-SIGNALS. THOMAS D. WILLIAMS, Allegheny City, and JOHN A. LEGGET, Bellevue, assignors of three-fifths to James W. Clark, George M. Bitmiller, and George Morris, all of Allegheny County, Pa. Filed Apr. 30, 1888. Serial No. 272,294. (No model.)

Claim.—1. In a block-signal system, the combination of a source of electrical energy and a differentially-wound polarized relay in circuit therewith, and a railroad-signal connected with the armature of the relay and operated thereby, substantially as described.



2. The combination of a stationary source of electrical energy, two or more differentially-wound polarized relays, each connected with the line-wires of two adjacent line-circuits or block-sections, and a signal operated mediately or immediately by the armature of a differentially-wound polarized relay, substantially as described.

3. The combination of a stationary source of electrical energy normally disconnected from the line-circuit, mechanism, substantially as described, for connecting and disconnecting the generator to or from the circuit and for reversing the polarity, arranged to be operated by a passing train, and two or more differentially-wound polarized relays in the battery-circuit, and two or more railroad-signals, each arranged in relation to the armature of a differentially-wound polarized relay, so as to be operated thereby, substantially as described.

4. In an automatic electric block-signal system, the combination of a stationary battery or source of electrical energy with a lever placed on or near the line of the railway-track, each lever having an arm extending so as to come in contact and be turned backward or forward by a passing train, and two horizontal vibrating arms, each furnished with two insulated plates, connected, respectively, with opposite poles of the battery, two pairs of contacts electrically connected with the line-wires of the battery-circuit, and so arranged relatively to each other and to the insulated plates of the lever-arm that when one arm is depressed a current of one sign and when the other arm is depressed a current of the opposite sign is sent over the line-wires to differentially-wound polarized relays to operate the block-signals, substantially in the manner hereinbefore described.

384,812. COUPLING FOR SHAFTS, PULLEYS, &c. BENJAMIN I. WILLIAMSON, Little Rock, Ark. Filed Jan. 21, 1888. Serial No. 261,517. (No model.)

Claim.—1. The combination, with the shaft, of the sleeve formed with independent pairs of segmental tapering recesses, one pair at each end, and the pairs of segmental tapering wedges occupying the recesses, substantially as described.

2. The combination, with the shaft, of the sleeve formed with independent pairs of segmental tapering recesses, one pair at each end, and grooves in the recesses, and the segmental tapering wedges occupying the recesses, formed with ribs occupying the grooves, substantially as described.

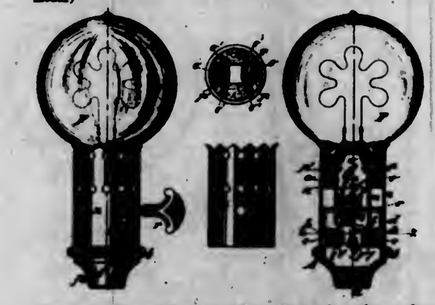
3. The combination, with the shaft, of the sleeve formed with independent pairs of segmental tapering recesses, one pair at each end, and the pairs of segmental tapering wedges occupying the recesses, having serrated inner surfaces, substantially as described.

4. The combination, with the shaft, of the sleeve formed with independent pairs of segmental tapering recesses, one pair at each end, and grooves in the recesses, and the segmental tapering wedges occupying the recesses, formed with ribs occupying the grooves, and having serrated inner surfaces, substantially as described.

384,813. PROCESS OF REFINING IRON WITH AIR. RILEY P. WILSON, Cleveland, Ohio, assignor of one-half to Franklin J. Wall, New York, N. Y. Filed Nov. 21, 1883. Renewed May 26, 1888. Serial No. 273,993. (No specimens.)

Claim.—The process herein described for treating impure iron for the manufacture of wrought-iron and steel, the same consisting in subjecting the impure iron while in a molten state to the action of a blast of air, in order to oxidize and carry off the impurities, and simultaneously subjecting the iron to the action of a reducing-atmosphere of hydrocarbon gas or vapor held above the surface of the molten metal, substantially as specified.

384,814. CEMENT WASH-TUB. CHARLES WEBLEY, West New York, N. J. Filed Mar. 17, 1888. Serial No. 267,672. (No model.)



Claim.—1. The combination, with a cement wash-tub having a partition, of a channel having overflow-openings and strainers in the partition, and an enlarged head for the waste-pipe set into the bottom of the same, and provided with a drain-opening and a plug-seat at each side of the partition, and with an intermediate opening communicating with the overflow-channel into the partition, substantially as set forth.

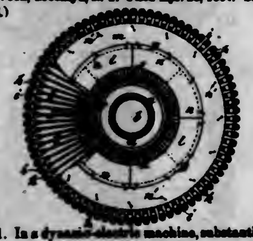
2. A head for the waste-pipes of wash-tubs, composed of a top plate having drain-openings and plug-seats, an overflow-opening between said plug-seats, and a bottom part enlarged at the upper and contracted at the lower end, substantially as set forth.

3. The combination of the enlarged head for the waste-pipe of a cement wash-tub, said head consisting of a top plate provided with drain-openings, plug-seats, an overflow-opening between said plug-seats, and recessed ears at both sides, and a bottom part having a contracted lower end, with a detachable collar or sleeve having recessed side ears, and screw-nuts for connecting the ears, the top plate, and collar, substantially as set forth.

384,815. INCANDESCENT-LAMP SOCKET AND SWITCH. JAMES J. WOOD, Brooklyn, N. Y. Filed Oct. 1, 1884. Serial No. 144,494. (No model.)

Claim.—1. The combination, with an electric incandescent lamp having terminal conductors or contacts in its base or neck, of a holder or tube to receive the neck of the lamp having an internal straight contact-spring, *m*, adapted to spring into engagement with one of the lamp-terminals when the lamp is slipped into the holder, with a second contact-spring, *m*, normally bent away from the opposite terminal of the lamp, and with a manipulating-key to press said bent spring into or out of contact with the lamp-terminal, substantially as herein shown and described.

2. In an electric-lamp holder, the containing-socket A, formed with the indentations *c c*, in combination with circuit-connections fastening to the interior of the holder at or near the indentations, with screws fastening said connections and embedded in said recesses, and the external clamp-sleeve, *n*, embracing the socket outside of said recess, substantially as herein shown and described.



3. An electric-lamp holder formed by the combination, with the socket A, having the lateral binders, *f*, and contact-springs *m m*, of a manipulating-key for acting on one of the springs, and the external clamping-sleeve, *n*, slit to permit its passage over the key and embracing at its base a neck or the socket A, substantially as and for the purpose set forth.

4. The combination, with the holder A, of the binders *f f'* and springs *m m*, with the insulation *l l*, insulated fastening-screws *h*, the key *r*, its cam *t* and its insulating cam-face *t'*, and the surrounding clamping-sleeve *n*, substantially as herein shown and described.

5. In an electric-lamp holder, the combination, with the contact spring or springs *m*, of the key *r*, with its operating-cam and its stop-collar *s*, with the fixed stop *w*, arranged and operating substantially as set forth.

6. In an electric-lamp holder, the combination, with two contact-springs arranged to approach each other and to engage with the contacts of the lamp, of an insulating guard-plate placed at and secured to the top of one or both springs to prevent electric contact between the two, substantially as herein set forth.

384,816. COMMUTATOR FOR DYNAMO-ELECTRIC MACHINES. JAMES J. WOOD, Brooklyn, N. Y. Filed Apr. 30, 1887. Serial No. 236,455. (No model.)

Claim.—1. In a dynamo-electric machine, substantially such as set forth, a shield-plate of insulating material laid upon and secured to the commutator-strips, and embracing the commutator, and extending over the commutator-strips or hollow of the armature, leaving the space between the strips or hollow of the armature open at the periphery, substantially as and for the purpose set forth.

2. In a dynamo-electric machine, the combination, with the commutator, of a shield of fire-proof material embracing the same, and covering the commutator-connections and the end of the armature, substantially as and for the purpose set forth.

3. The combination, with an electric commutator and armature, substantially such as set forth, of an annular shield of mica closely embracing the commutator, and covering the connection between armature and commutator, substantially as and for the purpose set forth.

4. The combination, with an electric commutator, substantially such as shown, of a shield made in segments, *l*, embracing the commutator, and covering the connection between commutator and armature, substantially as shown and described.

5. The combination, with an electric commutator, of a shield made in segments, *l*, in two layers, embracing the commutator and overlying each other, covering the connection between commutator and armature, substantially as shown and described.

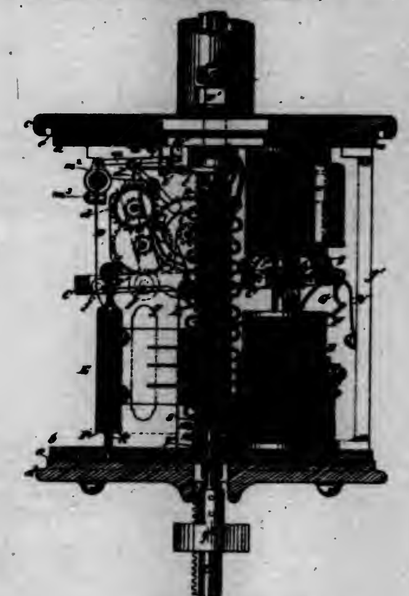
6. The combination, with an electric commutator, of the shield B, made in two portions of different materials, the inner part of which is made of mica, and the outer part of paper or its equivalent, substantially as shown and described.

7. The combination, with an electric commutator, of a shield, B, embracing the commutator and resting against the commutator-strips, and loops *n* or *n'*, securing said shield to the strips, substantially as shown and described.

8. The combination, with an electric commutator formed with a peripheral groove, *k*, of a shield-plate or septum let into said groove, and embracing the commutator and extending radially therefrom, forming a septum between commutator and armature, substantially as shown and described.

9. The combination, with an electric commutator, of the shield or septum B, formed of the inner segmental layers, *l l*, and the outer ring, *m*, substantially as shown and described.

10. The combination, with an electric commutator having the groove *k* and strips *t*, of the layered shield-segments *l l* and ring *m*, with the loops *n n'*, substantially as shown and described.



11. The combination, with an electric commutator, substantially such as set forth, of the insulating-ring F, interposed between the segments *d* and base-flange *e*, substantially as and for the purpose set forth.

12. In an electric commutator, substantially such as set forth, a flaring and deflecting ring arranged between the segments and the base flange or hub, substantially as shown and described.

13. In an electric commutator, substantially such as set forth, the ring F, made of insulating material in a flaring form, arranged between the segments and the base flange or hub, substantially as shown and described.

14. In a commutator, the combination of the hub *a*, segments *d*, insulating-ring *e*, base-flange *c*, and guard-ring F, clamped between the segments *d* and ring *e*, substantially as shown and described.

384,817. ELECTRIC-ARC LAMP. JAMES J. WOOD, Brooklyn, N. Y. Filed Aug. 10, 1887. Serial No. 246,859. (No model.)

Claim.—1. In an electric-arc lamp, the combination, with a regulating-magnet and its armature and armature-lever, having a play in the connection between the lever and armature, of a contact on the armature and a contact on the lever, and a by-pass around the arc connected to and completed through said contacts, substantially as and for the purpose set forth.

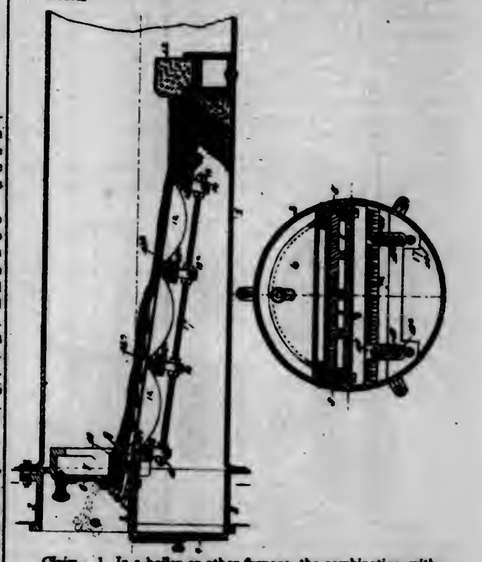
2. In an electric-arc lamp, the combination, with the adjustable carbons and mechanism to adjust the same, of an electro-magnet in the circuit of the lamp, an armature actuated thereby interposed between the magnet and the regulating mechanism and connected with the same, with a limited play in the connection, contacts operated by said play, and a short circuit or by-pass around the arc which is completed through said contacts, substantially as and for the purpose set forth.

3. In an electric-arc lamp, the combination, with a main magnet in the arc-circuit and a minor magnet in a shunt to the arc, of an armature moving between and actuated by the two, regulating mechanism to control or adjust the carbons connected with said armature with a limited play in the connection, a movable contact on the armature and a second contact adjacent thereto, which contacts are opened or closed by the independent play of the armature, a by-pass or resistance-coil parallel to or around the arc completed through said contacts, whereby the main magnet will pull the armature on one side of its play, open the contacts and cut out the coil, cut in the lamp, separate the carbons, and form the arc, while the shunt-magnet will move the armature to the other side of its play, close the contacts, cut in the coil, and continue the current to the other lamps until the arc in the abnormal lamp is restored, substantially as herein shown and described.

4. In an electric-arc lamp, the combination, with movable or adjustable carbons, an electro-magnet in circuit with the carbons, an armature actuated thereby, an armature-lever for adjusting the carbons connected with said armature with an idle play in the connection, contacts operated by said play, an auxiliary conductor or resistance-coil parallel with or around the arc connected with and completed through said contacts, and a retracting-spring, such as *o*, which normally takes up the play between the armature and armature-lever and closes said contacts, substantially as herein set forth.

5. The combination, in an arc lamp, with mechanism to adjust the carbons, a magnet to control the regulating mechanism, an armature actuated thereby and connected to said mechanism with a limited play in the connection, contacts operated by said play, and an auxiliary conductor in a parallel path with the arc completed through said contacts, with a minor retracting device acting to retract the said armature directly to take up the said play and close said contacts, and a main retracting device connected with the regulating mechanism to move it in opposition to the main attraction of the magnet, substantially as herein shown and described.

6. In an electric-arc lamp, the combination, with a regulating-magnet, its armature actuated thereby, and an armature-lever therewith connected with a limited play in the connection, of a contact on the armature and a contact on the lever of opposite polarities, and a contact on the fixed frame of the same polarity as that on the armature, the lever-contact being adapted to make and break contact with the other two, with a short circuit or by-pass around the arc connected with the lever-contact and put into or out of circuit by the meeting or separation of said contacts, substantially as herein shown and described.



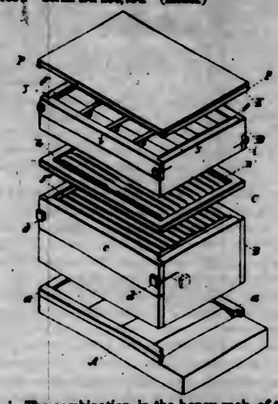
7. In an electric-arc lamp, a hand-switch having an elongated rotary spindle, with a resistance-coil wound over and mounted loosely upon the said spindle.

8. In an electric-arc lamp, the combination, with a hand-switch having an elongated rotary spindle extending vertically between the heads of the lamp-frame and journaled therein, of a fixed resistance-coil wound over and encircling the spindle between the heads, but unattached to or loose upon said spindle, substantially as herein shown and described.

9. In an electric lamp, the combination, with a switch-spindle, *y*, of a resistance-coil, K, mounted upon and loosely encircling the same, and interposing strips *s* of heat-proof insulating material, substantially as described.

10. In an electric lamp, in combination with a rack carbon-holder and a wheel-train meshing therewith, the adjustable crank or toggle-hub *n'* and connecting-link *m*, arranged and operating substantially as and for the purpose set forth.

384,818. SMOKE-CONSUMING FURNACE. RUDOLF ANNEMANN, Zurich, Switzerland. Filed Oct. 14, 1887. Serial No. 252,257. (No model.)



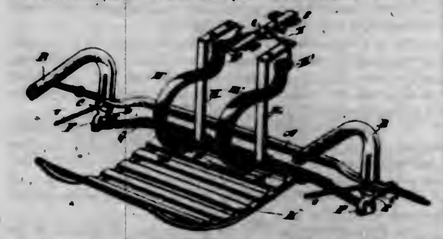
Claim.—1. In a boiler or other furnace, the combination, with a stationary inclined grate, of a front or feed chamber having longitudinal passages, pivoted valves for closing said passages, and sliding shovels or stoking-bars having elevations, ribs, or teeth and adapted to operate upon the grate through the valve-controlled passages, substantially as described.

2. In a boiler or other furnace, the combination, with the fire-chamber, of the front frame having a horizontal floor, the bridge-piece having longitudinal passages and valves, the feed-door, the inclined grate, and the sliding shovels or stoking-bars, substantially as described.

3. In a boiler or other furnace, the combination of a grate formed of the transverse bearer-bars carrying the grate-bars, and the longitudinal tie-rods passing through eyes formed on the bearer-bars and having nuts for firmly clamping all the parts together, substantially as described.

4. In a boiler or other furnace, the combination of the stationary inclined grate and the slag receiver or trough formed in the rear or bottom support thereof, with the fire and feed chambers, substantially as described.

384,819. BEE-HIVE. ELVIN S. ARMSTRONG, Jerseyville, Ill. Filed May 2, 1887. Serial No. 236,754. (Model.)



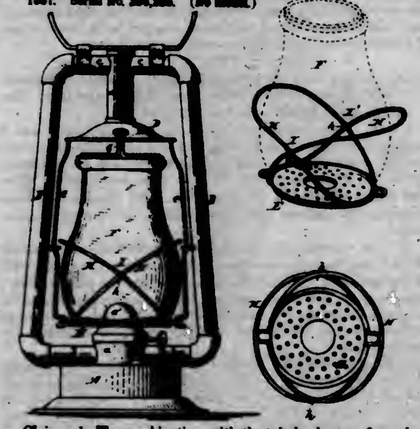
Claim.—1. The combination, in the honey-rack, of the side walls thereof, provided with flanges J, the angle-bars *f f'*, and cross-bars B, said angle-bars and cross-bars being secured in position by having their ends prolonged so as to project beneath the flanges J, all constructed substantially as and for the purpose set forth.

2. The combination, with the fixed ends and removable parts of the sides of the hive, of the fastenings *d*, consisting of flat pieces of metal provided with T-heads, as described, the flat parts or shanks thereof being pivotally secured in slits *e* in the ends or fixed walls of the hive and adapted to swing around horizontally into similar and corresponding slits in the removable parts of the walls, so as to clamp said parts securely in position, all constructed and adapted to operate substantially as and for the purpose specified.

3. The combination, with the brood-chamber having a portion of its front wall removable, and the brood-frames, of supporting angle-bars *f''*, secured to the lower part of the inner faces of the end walls of the brood-chamber, and removable angle-bars *f'''*, adapted to rest upon the ends of the top bars of the brood-frames and secured in position by a prolongation of the ends thereof fitting into cavities *g*, located in the upper part and near the ends of the removable portion of the side wall of the brood-chamber, the opposite or fixed side wall being provided with similar cavities for the reception of the opposite ends of said removable angle-bars, all constructed substantially as and for the purpose set forth.

384,820. ROAD-CART. CHARLES L. BARRETT, Allegan, Mich. Filed Feb. 17, 1888. Serial No. 264,417. (No model.)

Claim.—1. In a road-cart of the character described, the combination, with the axle, the thills rigidly secured to the axle, the couplings F, hung loosely to the under side of the axle by means of the rings E and the clips D, the latter being bolted firmly to the axle, the spring G, pivotally hung to the said couplings in line with the axle, and the foot-rest hinged to the spring and thills, of the seat-standards and seat, whereby the said axle and thills may oscillate without oscillating the spring G and the seat mounted upon the same, substantially as described.

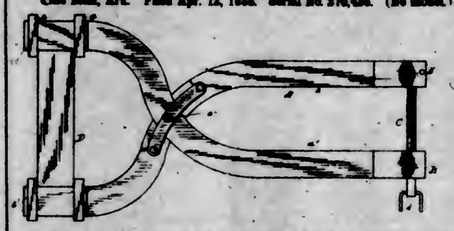


2. The combination, with the foot-rest and the ogee springs, of the spring-bail loosely connected to the ogee springs, the adjustable sliding bar beneath the seat, to which the bail is secured, and the adjusting-pin and seat, whereby the vehicle can be adapted and balanced to a light or heavy driver, substantially as specified.

3. The combination, with the spring loosely connected with the axle, of the loosely-connected foot-rest, the seat-supports, the ogee springs, and the seat, all arranged to operate substantially as specified.

4. The combination, with the spring loosely connected to the axle, of the foot-rest, the seat-supports and seat, and the ogee springs and adjustable bar, whereby the tension of the springs may be adjusted to adapt the seat to light or heavy weights, substantially as set forth.

5. The combination of the axle, the spring loosely hung thereto, so as to oscillate independently of it, the seat-standards and seat, and the ogee springs mounted on the foot-rest and adjustably attached to the bottom of the seat, substantially as described.



384,821. LANTERN-GUARD. LEWIS F. ROWE, New York, assignor of two-thirds to The R. E. Dietz Company, New York, and the Steam Gauge and Lantern Company, Rochester, N. Y. Filed Nov. 26, 1887. Serial No. 256,265. (No model.)

Claim.—1. The combination, with the tubular lantern-frame having its base provided with a burner, of a globe-supporting plate surrounding the burner, and a rigid guard secured to said plate, open at the top, and provided on the front side of the lantern-frame with a depression through which the globe can be inserted and removed, substantially as set forth.

2. The combination, with the tubular lantern-frame having its base provided with a burner, of a globe-supporting plate surrounding the burner, and rigid oblique guard-bows secured with their lower ends to said plate and having their raised portions arranged opposite the inner sides of the tubes, substantially as set forth.

384,822. TIRE SHRINKER AND EXPANDER. HENRY C. GADY, Cleo Mouf, Ark. Filed Apr. 12, 1888. Serial No. 270,426. (No model.)

Claim.—1. As an improvement in tire shrinkers or expanders, the lever-arms having the threaded rod connecting their ends, substantially as shown and described.

2. The lever-arms having the grooves in their ends, and the threaded rod having a collar and working in a nut in one of said grooves, substantially as shown and described.

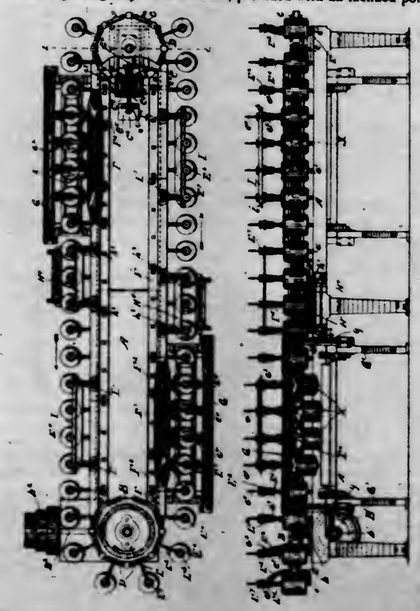
3. The lever-arms having the tire secured to their forward ends by links and wedges, and the threaded rod working in the other ends of said lever-arms, substantially as shown and described.

4. The herein-described improved tire shrinker and expander, comprising the lever-arms having the grooved ends, the links and wedges, the threaded rod having the circular collar, and the nut secured in one of said grooved ends, substantially as shown and described.

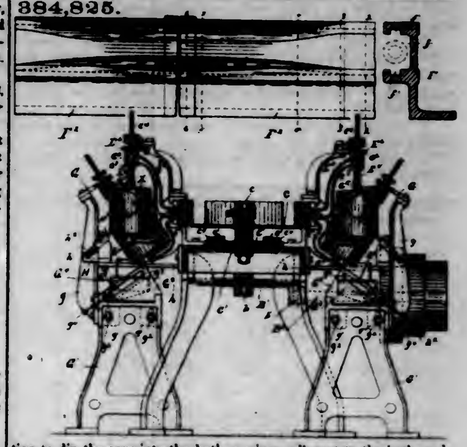
384,823. LIQUID EXTRACT OF MEAT. STEPHEN M. CAPUTE, Middle Brighton, near Melbourne, Victoria. Filed Mar. 29, 1888. Serial No. 268,991. (No specimens.)

Claim.—As a new article of manufacture, a liquid extract of meat compound consisting of a combination of the raw juices of lean meat with glycerine, to which may be added chloride of sodium or the other ingredients mentioned, neither said compound nor its ingredients being either concentrated or subjected to any degree of heat whatever, substantially as herein described and explained.

384,824. BOTTLE-STOPPER. WILLIAM A. CASWELL, Chicago, Ill. Filed Feb. 20, 1888. Serial No. 264,562. (No model.)



Claim.—The combination, with the bottle having lips *c* and the cork or stopper B, of a metal retaining-plate cut from sheet metal and having one or more ribs or projections stamped in its body portion and furnished with points *c*, substantially as specified.



384,825. CAN-SOLDERING MACHINE. ARNOLD D. COLEMAN, Chicago, Ill., assignor of one-half to Michael Cudahy, same place. Filed Dec. 17, 1887. Serial No. 258,250. (No model.)

Claim.—1. In a can-soldering machine, the combination, with a solder bath, of a carrying-chain composed of links connected by swivel-joints and provided with revoluble clamping-chucks to clamp the cans endwise, and a guiding-way for the said chain, provided with an inclined section adjacent to the solder bath to tilt the cans and cause the same to dip into the bath, substantially as and for the purposes specified.

2. In a can-soldering machine, the combination, with a solder bath, of a carrying-chain composed of links connected by swivel-joints and provided with revoluble chucks for clamping the cans endwise, a guiding-way for said chain, provided with an inclined portion to tilt the cans into the bath, and means for revolving the said chucks during their passage along the inclined portion, substantially as and for the purposes specified.

3. In a can-soldering machine, the combination, with a solder bath, of a carrying-chain the links of which are connected by swivel-joints and are provided with revoluble chucks for clamping the cans endwise, a guiding-way for said chain, provided with an inclined portion to dip the cans into the bath, a wiper adjacent to the bath, and means for revolving the chucks and the cans therein while passing the bath and the wiper, substantially as and for the purposes specified.

4. In a can-soldering machine, the combination, with a carrying-chain composed of swiveling links provided with revolable chucks having separable clamping-disks, of a solder bath, a guiding-way for the chain, having an inclined portion to dip the cans in the bath, means for revolving the cans while dipped, and a stationary cam for separating the clamping-disks, substantially as and for the purposes specified.

5. In a can-soldering machine, the combination, with a suitable table or frame having a sprocket-wheel at each end, of a carrying-chain composed of swiveling links, each provided with a revoluble can-holding chuck, guiding-ways on each side of said table, provided with inclined portions for tilting the cans, a solder bath adjacent to each inclined portion, a wiper adjacent to each solder bath, and means for revolving the cans while passing the baths and wipers, substantially as and for the purposes specified.

6. In a can-soldering machine, the combination, with the solder baths, the endless carrying-chain provided with laterally-projecting can-holding chucks, and suitable guiding-ways in which said chain travels, of the sprocket-wheels around which said chain passes, one of said sprocket-wheels being provided with an automatic tension device to keep the chain stretched and upright, substantially as and for the purposes specified.

7. In a can-soldering machine, the combination, with the endless carrying-chain D, provided with can-holders, of the sprocket-wheels B and C, the latter mounted in a slide, C', the spring C^3, bearing against said slide at one end, and an adjustable abutment for the other end of said spring, substantially as and for the purposes specified.

8. In a can-soldering machine, the combination, with the carrying-chain composed of flat body-links provided with can-holders and having projecting lugs *d*, of the guiding-way F, having open groove *f*, with extensions *f'*, to receive the said lugs, substantially as and for the purposes specified.

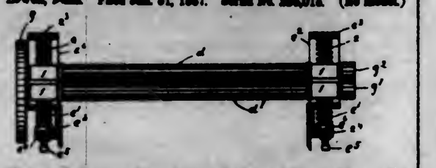
9. In a can-soldering machine, the combination, with the carrying-chain provided with can-holders and having swiveling joints, of the guiding-way consisting of a straight portion, F, and inclined portion F^2, with intermediate connecting portions, F^3, of gradual curvature, substantially as and for the purposes specified.

10. In a can-soldering machine, the combination, with the guiding-way provided with an inclined portion, of the carrying-chain composed of main links *D'*, provided with can-holders, and intermediate swiveling links, D^2, connecting the main links, substantially as and for the purposes specified.

11. In a can-soldering machine, the combination, with the guiding-way, of the carrying-chain composed of main links *D'*, provided with can-holders, and the intermediate swiveling links pivoted thereto and each consisting of a cylindrical socket-piece, d^2, a grooved head, d^3, and a pin or key, d^4, connecting the two, substantially as and for the purposes specified.

12. The combination, with the guiding-way, of the link *D'*, the bracket E, having arms E' and E^2, the disk E^3, mounted in the former, the revolving sleeve e^3, mounted in the latter and provided with pinion E^4, the rod e^4, splined in the sleeve e^3 and carrying the clamping-disk E^5, the spring E^6, the collar E^7, and a suitable rack and camway with which said pinion and collar respectively engage, substantially as and for the purposes specified.

13. The combination, with the carrying-chain and its revolving chucks, each provided with a pinion, of the guiding-way for said chain, provided with an inclined portion, the solder bath arranged adjacent thereto, and a fixed rack, G, with which the said pinions engage when the chucks are inclined, substantially as and for the purposes specified.



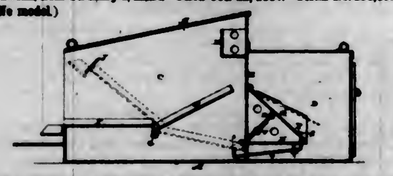
14. The combination, with the fixed wiper, of the rack H^4, adjacent thereto, the carrying-chain provided with revolable chucks, and pinions on said chucks to engage the said rack, substantially as and for the purposes specified.

15. In a can-soldering machine, the combination, with the endless carrying-chain and its can-holding chucks, of a solder bath and inclined ways upon which said bath is mounted, said bath being adjustable on said ways to vary its relation to the ways both vertically and laterally, substantially as and for the purposes specified.

16. The combination, with the uprights G', of the vertically-adjustable end supports, G^2, having inclined slots g^2, the table G^4, carrying the solder bath G^5 and provided with tongues G^6, entering the said inclined slots, and the adjusting-screws g^4, substantially as and for the purposes specified.

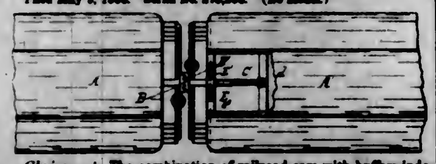
17. In a can-soldering machine, the combination, with the inclined ways H, of the oil-reservoir H', mounted and adjustable thereon, and the wiper H^3, consisting of a strip of felt or other absorbent material, extending upward and inward through a suitable slot in said oil-reservoir, substantially as and for the purposes specified.

384,826. MACHINE FOR OPENING COTTON. HENRY A. DAVIS, Lowell, Mass. Filed Jan. 31, 1887. Serial No. 226,012. (No model.)



Claim.—1. In a machine for beating or opening cotton or other fibrous material, the combination, with a rotary beater, of a pair of feed-rolls and means for pressing each roll of the pair upon the material interposed between the said rolls, said means being elastic retaining devices whereby the feed-rolls are adapted to yield when said material is struck by the beater, substantially as described.

2. In a machine for beating or opening fibrous materials, the combination, with a beater and pair of feed-rolls, of elastic supporting devices for the purpose of enabling the said rolls to yield in the direction of the blows struck by the said beater, as and for the purpose specified.

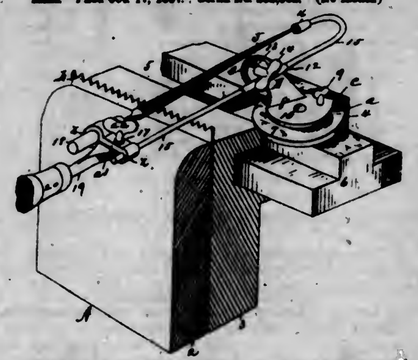


3. In a picker or opener for fibrous materials, the combination, with the feed-rolls *d d'*, provided with vertically-sliding bearings *f f*, of elastic retaining devices *e e'* above and below the said bearings, substantially as herein set forth, for the purpose specified.

384,827. ANIMAL-TRAP. WILLIAM DEVORLD and WILLIAM C. DEVORLD, near St. Mary's, Kans. Filed Oct. 22, 1887. Serial No. 253,156. (No model.)

Claim.—The combination of the frame A, divided by the partition B into the two chambers C D, with the pivoted platform F, the platform N, the inclined door Q, having the rod T secured to its under side, and the rod O, having its two ends bent at an angle, and which is caused to partially revolve by the movement of the door Q, substantially as shown and described.

384,828. RAILROAD-CAR. THOMAS S. B. DUNN, Hyde Park, Ill. Filed May 9, 1888. Serial No. 273,506. (No model.)



Claim.—1. The combination of railroad-cars with buffers independent of the draw-bar, adapted to automatically lock with and unlock from each other, provided with springs for moving them longitudinally to maintain their engagement, and bodily movable laterally in both directions against an opposing spring force, substantially as described.

2. The combination of railroad-cars with buffers arranged at or near the top of the cars, adapted to automatically lock with and unlock from each other, provided with springs for moving them longitudinally to maintain their engagement, and bodily movable laterally in both directions against an opposing spring force, substantially as described.

3. In a railroad-car, the combination of a buffer movable laterally in both directions from its normal position with two springs exerting their force upon it in opposite directions to resist such movement, and with stops to limit the motion of said springs, substantially as described.

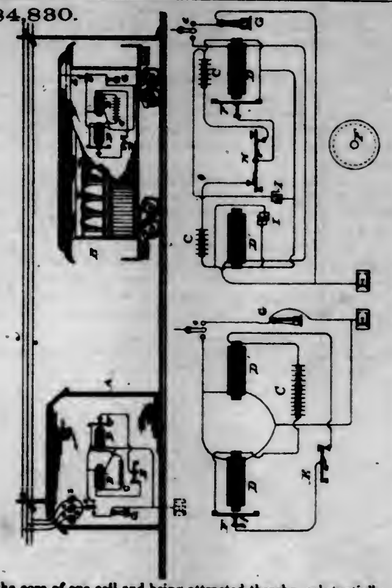
4. In a railroad-car, the combination of a laterally-movable buffer, a spring adapted to resist the lateral movement of the buffer in one direction from its normal position, and a stop adapted to prevent said spring from exerting its force against the buffer when the latter is moving in the other direction from its normal position, substantially as described.

384,829. SAW-FILING DEVICE. EDWIN D. EATON, Springfield, Mass. Filed Oct. 17, 1887. Serial No. 252,582. (No model.)

Claim.—1. A saw-filing machine consisting of a saw-clamp, A, having a longitudinal groove, 5, therein, a block, 6, capable of a free sliding movement in said groove, a file-holder consisting of the frame 15, having a socket on one end to receive the tip of the file, a file-shank receiver, 18, a clamp, 17, having a handle thereon holding said receiver and capable of attachment to and of longitudinal adjustment on said frame, a swivel-stand, 8, pivotally connected to said block, and a swivel, 12, pivotally attached to said stand, in which said frame has a free longitudinal movement, substantially as set forth.

2. In combination, the frame 15, having a socket on one end to receive the tip of the file, the file-shank receiver 18, and the clamp 17, holding said receiver, having a handle thereon and capable of attachment to and of longitudinal adjustment on said frame, substantially as set forth.

3. The swivel-stand 8, the swivel 12, having the flange 13, and the screw 14, combined with the frame 15, having a free longitudinal movement in said swivel, and a socket, 16, thereon to receive the tip of the file, the file-shank receiver 18, and the clamp 17, holding said receiver, having a handle thereon and capable of attachment to and of longitudinal adjustment on said frame, substantially as set forth.



384,830. RAILWAY SIGNALING. THOMAS A. EDISON, Llewellyn Park, N. J., and ERIA T. GILLILAND, New York, N. Y. Filed Nov. 30, 1886. Serial No. 220,115. (No model.)

Claim.—1. In transmitting apparatus for induction railway signaling, the combination, with two or more induction-coils having their secondary circuits connected to line, of a battery, a key, and a vibrator, all located in the primary circuits of the two or more induction-coils, substantially as set forth.

2. In transmitting apparatus for induction railway signaling, the combination, with an induction-coil having its secondary circuit connected to line, of a battery, a key in the primary circuit of such induction-coil, and a diaphragm-vibrator also located in such primary circuit, the diaphragm being located near the end of the core of the induction-coil and being attracted thereby, substantially as set forth.

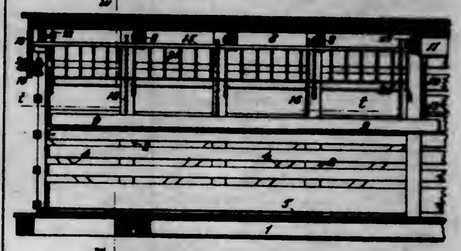
3. In transmitting apparatus for induction railway signaling, the combination, with two or more induction-coils having their secondary circuits connected to line, of a battery, and a key in the primary circuits of such induction-coils, and a diaphragm-vibrator also located in the primary circuits of both coils, the diaphragm being located oppo-

384,830.

site the core of one coil and being attracted thereby, substantially as set forth.

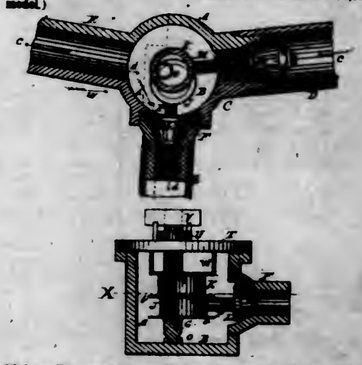
4. In transmitting apparatus for induction railway signaling, the combination, with the transmitting battery and key, of a diaphragm-vibrator in circuit therewith, substantially as set forth.

384,831. ELEVATOR-ALARM. JOHN BUNS, Jacksonville, Fla. Filed Dec. 13, 1887. Serial No. 257,670. (No model.)



Claim.—1. The combination, with an elevator-car, of an alarm secured thereto, a shaft for operating said alarm, a friction-wheel on said shaft, and a cord extending throughout the extent of the travel of the elevator-car and engaging with said friction-wheel, as set forth.

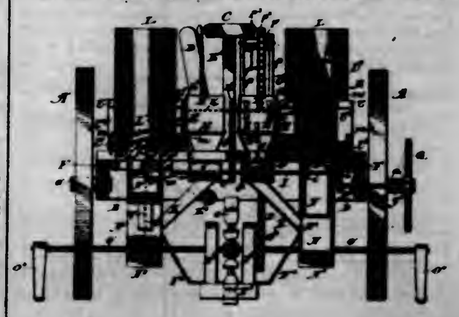
2. The combination, with the elevator-car, of an alarm secured thereto, a friction-wheel for operating said alarm, and a cord rove on said wheel and stretched vertically in the elevator-shaft, substantially as set forth.



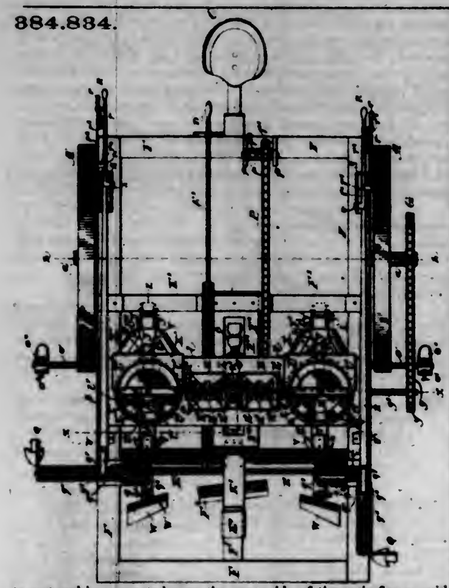
3. The combination, with the elevator-car, of a rotatable shaft journaled thereto, a ball on said shaft, a friction-wheel journaled loosely on said shaft, a perpendicular cord with which said wheel engages, and a pawl and ratchet secured to said shaft and wheel, respectively, whereby the shaft is revolved in one direction only, substantially as set forth.

384,832. STOCK-CAR. JAMES P. BLISS, Philadelphia, Pa. Filed Feb. 7, 1888. Serial No. 263,207. (No model.)

Claim.—The combination, with a railroad-car, of side rails or boarding secured to the outside of its body-posts above its girths, and a vertically-movable trough fitted to traverse adjacent to said side rails and having its side adjoining the same recessed to embrace the posts, so that the trough may project into and be raised and lowered within the spaces between the same, substantially as set forth.



384,833. SUPPLY-CHECK AND WASTE-PIPE VALVE. JOHN FARLEIGH, Austin, Ill. Filed Nov. 29, 1887. Serial No. 256,574. (No model.)



Claim.—The vertical post G, provided with the cams H I, in combination with the case A B T and horizontal pipes C E F, the annular straps J K, surrounding the cams and valves L Q, connected by rigid stems M P, the cup-plate W, and separating-plates *a b*, as and for the purpose specified.

384,834. CORN-PLANTER. JOSEPH FISHER, Frederick, Md., assignor of one-half to Abraham S. Bohn, same place. Filed Dec. 22, 1886. Serial No. 222,414. (No model.)

Claim.—1. In a corn-planter, the combination, with a main frame mounted upon supporting-wheels, of a movable frame of such size as

384,834.

to rest and be supported upon the upper side of the main frame, said movable frame being hinged at its rear end to the rear upper side of the main frame to allow its forward end a limited upward movement, a lever connected to the free forward end of the movable frame and extending rearwardly beneath the frames to the rear ends of the same within easy reach of the driver's seat, whereby the movable frame is raised and lowered, and a rack whereby the frame can be held at the desired adjustment, substantially as described.

2. In a corn-planter, the combination, with a main frame mounted upon supporting-wheels, of a movable frame normally resting upon the upper side of the main frame and pivotally secured to the same at its rear portion to allow its forward free end a limited upward movement from said frame, seed distributing and dropping mechanism carried by the movable frame and thrown in and out of gear with the driving-power by the movement of said frame, a rock-shaft transversely journaled in the main frame beneath the free end of the movable frame and connected with the movable frame at its free end, a lever connected with the rock-shaft and extending to the rear of the main frame, whereby the movable frame is operated, and means for holding said lever, and hence the movable frame, in the desired position, substantially as described.

3. The combination, with a main frame mounted upon supporting-wheels, of a movable frame pivoted to and supported upon the upper side of the main frame, seed-distributing mechanism actuated by one of the supporting-wheels, dropping-spouts in communication with the same, fertilizer-distributing mechanism connected with said dropping-spouts, a horizontal shaft, a ground-wheel to actuate the same, and hill-markers mounted upon said shaft, said seed and fertilizer distributing mechanism and the horizontal shaft being supported and carried by the movable frame, substantially as described.

4. In combination, a main frame, a movable frame hinged at its rear portion upon the same and supporting the seed distributing and dropping mechanism, a rock-shaft journaled in the main frame, tongues secured to the rock-shaft and to the movable frame, a sleeve loosely connecting said tongues, an operating-lever secured to the rock-shaft, and a rack for engaging the operating-lever and holding the movable frame in the desired adjustment, substantially as described.

5. The combination, with a frame and the seed-dropping mechanism of a planter, of a marker pivoted to said frame in vertical and horizontal adjustment and an operating-lever whereby the marker can be thrown upwardly and horizontally out of engagement with the ground, substantially as specified.

6. The combination, with a frame and seed-dropping mechanism of a planter, of changeable row-markers upon opposite sides of said frame, said markers being connected with the frame in vertical and horizontal adjustment, and levers pivoted to said markers, whereby the same can be held in or out of engagement with the ground, substantially as described.

7. The combination, with a frame and the seed-dropping mechanism of a planter, of a horizontal spindle or roller journaled on said frame, a marker hinged to the outer end of said roller, and an operating-lever pivoted to said marker, whereby the same can be held in or out of engagement with the ground, substantially as specified.

8. The combination, with a frame and the seed-dropping mechanism of a planter, of rollers or spindles journaled in horizontal bearings on the frame, outwardly-extending arms hinged to the outer ends of said rollers to have a limited horizontal swing, downwardly-extending arms carrying shovel-blades upon their lower ends, and marker-operating levers pivoted to said outwardly-extending arms, substantially as specified.

9. The combination, with a frame and seed-dropping mechanism, of a marker hinged to a horizontal roller journaled on said frame, an operating-lever pivoted to said row-marker, a hand-lever and locking-lever pivoted to said operating-lever, and a holding-plate secured to the frame and provided with apertures to receive said locking-lever, whereby the marker can be thrown in or out of engagement with the ground and held in the desired adjustment, substantially as specified.

10. The herein-described row-marker, consisting of a roller or spindle journaled in a horizontal bearing or socket in an upright post and provided with a stop upon its inner end, an outwardly-extending arm hinged to the outer end of said arm to swing horizontally, a downwardly-extending arm secured to the free end of said outwardly-extending arm and provided on its lower end with a shovel-blade, an operating-lever, a link pivotally connecting an end of said lever with the inner end of said outwardly-extending arm, a locking-lever and hand-lever pivoted to the handle portion of said operating-lever, and a holding-plate provided with apertures to receive said locking-lever, substantially as set forth.

11. The combination, with the main-frame-supporting wheels and a secondary shaft journaled in said frame and driven by one of the supporting-wheels, the shaft being provided with a gear-wheel, of a movable frame supported upon and pivoted to the main frame, seed and fertilizer distributing mechanisms carried by the movable frame, a shaft journaled in the movable frame and provided with gearing to drive said mechanisms, a gear-wheel upon said shaft to normally mesh with the gear-wheel upon the secondary shaft, and a lever whereby the movable frame can be raised or lowered and the shafts journaled in the frames be thrown in and out of gear with each other, substantially as described.

12. In a corn-planter, the combination, with a main frame, a movable frame supported by the same, and the dropping mechanism, of a runner secured at its upper end to the center forward portion of the movable frame, a brace secured to the movable frame at its ends and bent downward at its center, to which the rear end of the runner is secured, a horizontal shaft journaled in bearings upon the runner, a ground-wheel centrally mounted upon said shaft and adapted to rotate the same, lugs upon said shaft to operate the dropping mechanism, and hill-markers adjustably secured to the outer ends of the shaft, substantially as described.

13. In a corn-planter, the combination, with a main frame and a movable frame supported by the same, of a runner secured at its upper end to the forward central portion of the movable frame and curving downwardly and rearwardly from the same, a downwardly-bent brace secured to the movable frame at its upper end and to the rear end of the runner at its lower central portion, a curved scraper secured across the forward portion of the runner in an oblique position, a horizontal shaft journaled in bearings on the runner, a ground-wheel mounted upon and actuating said shaft, and the seed-dropping valves actuated by said horizontal shaft, substantially as described.

14. In a corn-planter, the combination, with a frame, of the seed-distributing mechanism, the dropping-spouts, spring-actuated dropping-valves provided with laterally-extending lugs and normally closing the lower ends of said spouts, a runner provided with a longitudinal opening, a horizontal shaft carried by the runner, a ground-wheel secured to the horizontal shaft and engaging the ground through the opening in the runner, lugs carried by and revolving with said shaft and adapted to engage the lugs upon the dropping-valves and operate the valves, and hill-markers rotating with said shaft, substantially as described.

15. In a corn-planter, a supporting-frame, a horizontal shaft, a ground-wheel secured to and driving the same, valve-opening lugs, and revolving hill-markers carried by said shaft, in combination with a sprocket-wheel secured to said shaft, an upright frame secured to the supporting-frame near the driver's seat, a horizontal shaft journaled in the upper portion of said upright frame, a sprocket-wheel mounted upon said shaft, a sprocket-chain connecting said two sprocket-wheels, and hand-levers carried by the shaft in the upright frame, substantially as described.

16. The combination, with a seed-dropping spout, of a coverer-standard carving outwardly and downwardly, laterally-extending lugs or arms upon the lower portion of said standard, and curved coverer-blades adjustably secured at their rear portions to said lugs in an oblique position, substantially as described.

17. The combination, with a seed-spout, of a coverer-standard

secured to the same and extending rearwardly and downwardly, and provided with a laterally-extending arm upon each side of its lower portion, a pair of curved coverer-blades, each blade being adjustably secured at its rear upper edge to one of said arms in an oblique position, screws to adjustably secure the coverer-blades to said arms, and a roller journaled in the lower end of the standard, substantially as described.

18. In a planter, a seed-dropping tube, in combination with a vertically-adjustable standard secured to and extending forwardly from said tube, an opener-blade, and a curved scraper carried by said standard in front of the seed-tube, a coverer-standard secured to and extending rearwardly from said tube, and coverer-blades carried by said coverer-standard, substantially as described.

19. Furrow-opener standards carrying opener-blades on their lower ends, in combination with scraper-standards secured to said opener-standards and extending forwardly from the same, and curved scrapers secured to the forward ends of said scraper-standards in an oblique position, substantially as specified.

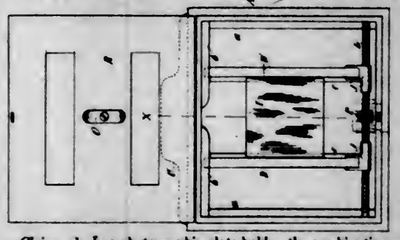
20. In a corn-planter, the combination, with a frame, of a cylindrical seed-distributing box, a horizontally-rotating seed-conveying plate closing the bottom of said seed-box, a cylinder secured to the upper side of said plate and extending upwardly into the interior of the seed-box, said cylinder being adapted to partially close the lower portion of the seed-box and leave a narrow vertical space between its outer periphery and one side of said box for the passage of seed to the seed-plate, whereby the seed is delivered to the pockets of the seed-plate in an upright position, and downwardly-extending stirrers carried by the upper end of said cylinder, substantially as described.

21. In a corn-planter, the combination, with a supporting-frame and a cross-frame carried by the same, of seed-boxes carried upon the upper side of the cross-frame, seed-dropping spouts in communication with the seed-boxes and depending from the cross-frame below the same, spring-actuated dropping doors or valves normally closing the open bottoms of the spouts, means for intermittently opening said valves, fertiliser-boxes carried upon the upper surface of the cross-frame between the seed-boxes, said cross-frame being provided with openings at the bottoms of the fertiliser-boxes, a horizontal shaft journaled beneath the cross-frame, conveying rollers mounted upon said shaft at the open bottoms of the fertiliser-boxes, a cover or sheath surrounding each roller, and spouts or conduits leading from said covers to the interior of the dropping-spouts above the dropping doors or valves, substantially as described.

22. In a corn-planter, the combination, with a seed-box having a portion of its lower part cut away, of a horizontal plate provided with seed-pockets and revolving in and closing the bottom of said box, a vertical cylinder revolving with said plate and extending upwardly into the box above the cut-away portion, said cylinder being adapted to close the cut-away portion of the box, but leave a vertical space between its periphery and the inner wall of the box opposite the cut-away portion for the passage of seed to the pockets of the rotary plate, whereby the seed is delivered from the seed-box to the seed-pockets of the rotary plate in an upright position, and gearing to drive said plate and cylinder, substantially as described.

23. In a corn-planter, the combination, with a seed-box having a portion of its lower part cut away and horizontal and upright pieces partially closing said cut-away portion, of a horizontal plate provided with seed-pockets and revolving in and closing the bottom of said box, a vertical cylinder provided with a cone-shaped top and revolving with said plate and extending upwardly into the interior of the box, said cylinder being adapted to close the cut-away portion of the box between the horizontal and upright pieces, but leave a space between its periphery and the inner face of the seed-box opposite the cut-away portion for the passage of seed to the pockets of the rotary plate, one or more laterally and downwardly extending stirrers within the seed-box upon the cone-shaped top of the cylinder, and gearing to drive said plate and cylinder, substantially as described.

24. In a corn-planter, the combination of a supporting-frame, a cross-frame, a seed-box carried by the cross-frame, a seed-plate provided with seed-pockets and revolving in and closing the bottom of the seed-box, a seed-discharging chamber extending through the cross-frame and with which the seed-pockets register as the seed-plate revolves, a valve pivoted to the cross-frame and normally closing the bottom of said chamber, said valve being operated by the seed-plate to discharge the seed from said chamber when the desired number of seed has been delivered into the same, a dropping-spout into which the seed from said chamber are adapted to fall, and a dropping-valve normally closing the lower end of said spout, substantially as described.

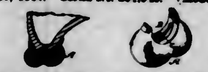


25. In a corn-planter, the combination of a supporting-frame, a cross-frame, a seed-box carried by the cross-frame, a rotary seed-counting plate revolving in and closing the bottom of said box and provided with seed-conveying pockets, a seed-discharging chamber with which said pockets register as the plate revolves, a spring-actuated valve pivoted to the cross-frame and provided with an arm to normally close the bottom of said discharge-chamber and with another arm extending over the face of the rotary plate, one or more lugs extending from the upper face of the plate and adapted to operate said valve to discharge seed from the chamber when the desired number of seed has been received into the same, and a dropping-spout into which the seed from said chamber pass, substantially as described.

26. In a corn-planter, a seed-box, a rotary seed-counting plate provided with seed-conveying pockets, a discharge-chamber provided with a valve, a dropping spout or tube provided with a spring-actuated dropping valve, and a seed-discharge funnel pivoted within said spout or tube beneath the discharge-chamber, substantially as described.

27. In a corn-planter, a seed-box, a rotary seed counting and conveying plate, a dropping tube or spout, a dropping-valve to close the bottom of said tube, and a discharge-funnel pivoted in the upper part of said tube or spout, whereby seed cannot be delivered into the dropping spout or tube until the dropping-valve has been opened and a hill dropped, as described.

28. In a corn-planter, a seed-box, a rotary plate, a dropping spout or tube, a dropping-valve closing the bottom of the same, a discharge-funnel pivoted in said spout or tube, a catch-lever connected with said pivoted funnel and operated by the rotary plate, a trip-lever connected with said dropping-valve, and a spring-catch, for the purpose set forth.



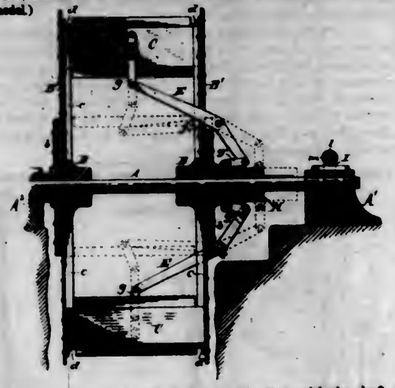
384,835. PHOTOGRAPHIC-PLATE HOLDER. MATHIAS PLAMBECK, Newark, N. J., assignor to The Scovill Manufacturing Company, New York, N. Y. Filed Sept. 23, 1886. Serial No. 214,283. (No model.)

Claim.—1. In a photographic-plate holder, the combination, with a frame, of movable jaws, a right-hand screw, a left-hand screw, a hand-piece between said screws for rotating the same, and nuts on the movable jaws having elongated bearings on the screws, substantially as and for the purpose specified.

2. In a photographic-plate holder, the combination, with a frame, of movable jaws, a right-hand screw, a left-hand screw, a bearing between said screws, a hand-piece, also between said screws, and nuts on the movable jaws having elongated bearings on the screws, substantially as and for the purpose specified.

384,836. ARTIFICIAL TOOTH. EDWARD A. FLOYD, Paola, Kans. Filed Mar. 19, 1887. Serial No. 231,549. (Model.)

Claim.—The combination, with the dental plate, of an artificial tooth, A, having a transverse groove, B, extending across its inner end, so that the ends or prongs of the grooved portions of the tooth will fit snugly against the opposite sides of the ridge of the plate, the sides of said tooth being open, and the flat-headed pin C, secured to the tooth in the bottom of the groove and projecting upward a suitable distance beyond the groove, so as to act as a stop for the tooth and to form a space between the tooth and the model, into which the soft hot rubber is swaged, substantially as shown and described.



384,837. FURNITURE-CASTER. WILLIAM R. GARD, Meriden, Conn. Filed Feb. 25, 1888. Serial No. 265,296. (No model.)

Claim.—1. In a furniture-caster, the combination, with the pintle having a knob at its inner end, of the combined socket and ferrule made in a single piece and provided with a detaining-spring, as set forth.

2. In combination, the pintle, and the combined socket and ferrule struck up from a single piece of metal, as set forth.

384,838. WATER-WHEEL. ADAM GEORGE and WILLIAM KLEINHANS, Buffalo, N. Y. Filed Jan. 30, 1888. Serial No. 262,221. (No model.)

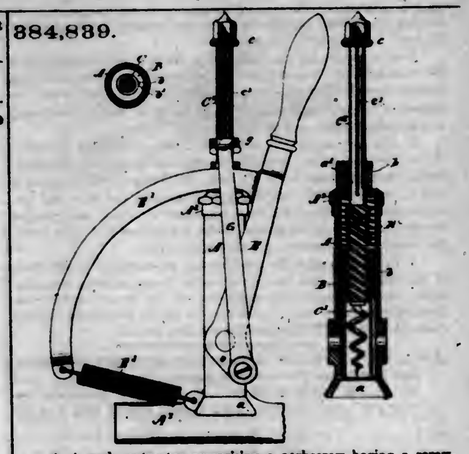
Claim.—1. In a water-wheel, the combination, with the shaft A and the two annular plates or disks B, provided with radial guides or ways c, of the radially-movable paddles or floats C, arranged between said disks and sliding in the ways c, the shifting collar or sleeve H, mounted on the shaft A, and the actuating-levers E, connecting said paddles or floats with the shifting sleeve H, substantially as set forth.

2. In a water-wheel, the combination, with the shaft A and the two annular plates or rings B' B', provided with radial guides or ways c, of the radially-movable paddles or floats C, arranged in said ways between the plates B' B', the shifting sleeve H, sliding on the shaft A, actuating-levers E, connecting the paddles C with the shifting sleeve H, and a feed screw or screws, whereby said shifting sleeve is actuated, substantially as set forth.

3. The combination, with a water-wheel, its supporting-shaft, and the frame A', of radially-movable paddles or floats C, a shifting sleeve, H, having arms *h h*, actuating-levers E, feed-screws J J, secured with their inner ends to said arms, worm-wheels I I, mounted in the frame A', and having hubs provided with screw-threaded openings, in which the feed-screws J work, worms *l l*, meshing with said worm-wheels, and a horizontal shaft, *m*, upon which said worms are mounted, and provided with a hand-wheel, *m'*, substantially as set forth.

4. In a water-wheel, the combination, with the hubs B B and disks B' B', secured to said hubs, of radial guides *c*, secured to said hubs and disks, and each composed of two parallel angle-irons, and movable paddles or floats C, arranged in said guides between the disks B' B', substantially as set forth.

5. In a water-wheel, the combination, with the hubs B B and disks B' B', secured to said hubs, of radial guides *c*, secured to said hubs and disks and each composed of two parallel angle-irons, and an annular flange or angle-iron, *d*, secured to the inner sides of said disks at the outer ends of said guides or ways, and movable paddles or floats C, arranged in said guides between the disks B' B', substantially as set forth.



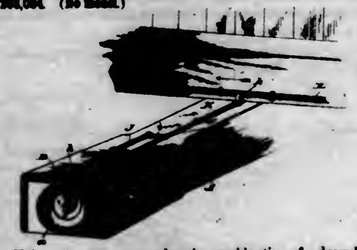
384,839. CORK-EXTRACTOR. RAYMOND B. GLADDING, Peoria, Ill. Filed Jan. 5, 1886. Serial No. 208,223. (No model.)

Claim.—1. A cork-extractor comprising a corkscrew having a screw-threaded extension, a sliding nut engaging the threads on the extension, a rack gearing with a pinion on the corkscrew, and an operating-lever acting during a portion of its throw to raise the corkscrew, substantially as described.

2. A cork-extractor comprising a corkscrew having a screw-threaded extension having the slot, a sliding nut engaging the threads on the extension, a rack, a pinion interposed between the extension and the rack and having a spline entering the slot in the extension, and an operating-lever acting during a portion of its movement to raise the corkscrew, substantially as described.

3. A cork-extractor comprising a corkscrew having a screw-threaded extension, a nut engaging the threads on the extension, a rack operating upon the extension for imparting rotary motion to the corkscrew, an operating-lever having the projection, and the lifting-arm connected to the said projection and to the corkscrew, substantially as described.

384,839. (Second figure)



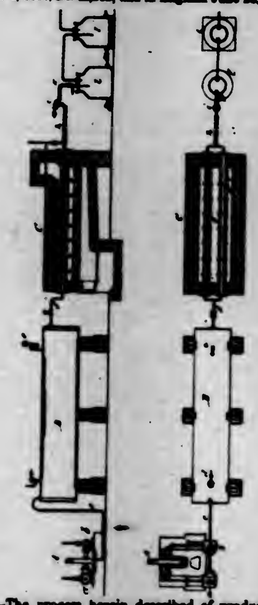
4. A cork-extractor comprising a corkscrew having a screw-threaded extension, a screw-threaded portion engaging the extension, a rack operating upon the extension for imparting motion to the corkscrew, an operating-lever having the projection, the raising-arm connected to the said projection and to the extension of the corkscrew, and the spring connected to the rack and to the base of the extractor, substantially as described.

5. In cork-extractors, the combination of a suitable cylinder, a nut perpendicularly movable therein, an axially and perpendicularly movable screw operatively set within said nut, provided at one end with a corkscrew and at its other end with an extension or stem, a pinion located upon said stem, an operating-lever pivotally held to said cylinder, a rack carried by said lever, which meshes with said pinion, operative to impart rotary motion to said pinion and therethrough to actuate said corkscrew, and a lifting-arm connected with said lever and stem, adapted through the action of said lever to perpendicularly move said corkscrew, all arranged and adapted to be operated substantially as herein described.

6. In cork-extractors, the combination of a suitable cylinder, a nut perpendicularly movable therein, a corkscrew carried fixedly by a screw set in said nut and susceptible of longitudinal and rotary motion therein, a spring within said cylinder interposed between the cap thereof and said nut, operative to exert a tensional strain perpendicularly upon said nut, a pinion carried by an extension or stem of said screw, which is free to move longitudinally therethrough and operative to be rotated thereby, a lever pivoted to said cylinder, a rack carried by said lever, which meshes with said pinion, adapted through the to and fro movements, respectively, of said lever to actuate said corkscrew through its forward and reverse longitudinal and rotary movements, and a lifting-arm connected with said lever and screw-stem, adapted through the action of said lever to move said corkscrew longitudinally, all arranged and adapted to be operated substantially as set forth.

384,840. CAR-COUPLING. EDWARD M. HAMILTON and JOHN O. HAMILTON, Russell's Place, Ohio. Filed Mar. 22, 1888. Serial No. 268,094. (No model.)

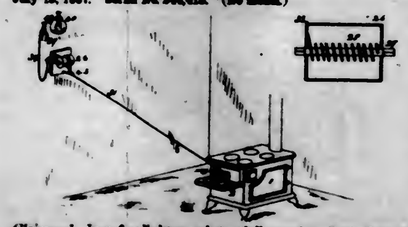
Claim.—1. In a car-coupler, the combination of a draw-head having a longitudinal aperture therein and a top transverse slot merging into said aperture, two laterally-movable coupling-blocks mounted in said aperture in the draw-head and having spring-encircled stems removably attached to the outer sides thereof and projecting through the sides of the draw-head and recessed in the rear and top sides, the sliding blocks, the operating-levers connected to said sliding blocks, and



the link whose head engages with the rear recesses in the coupling-blocks.

2. In a car-coupler, the combination, substantially as described, of the draw-head, the laterally-movable spring-actuated coupling-blocks having recesses in the top thereof, sliding blocks mounted in said top recesses of the coupling-blocks, the operating levers and rods connected to said sliding blocks, and the coupling-link.

3. In a car-coupler, the combination, substantially as described, of the draw-head, the laterally-movable spring-actuated coupling-blocks having recesses in the top sides, the sliding blocks mounted in said top recesses of the coupling-blocks, the long and short rod pivoted to the top of the draw-head, connected by a link, and attached at their front ends to the sliding blocks, the operating-lever to which the longer rod is attached, and the coupling-link.

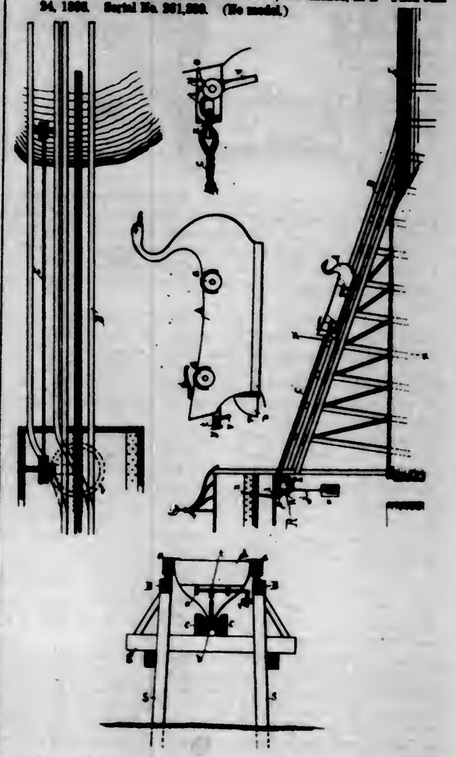


4. In a car-coupler, the combination, substantially as described, of the draw-head, the laterally-movable spring-actuated coupling-blocks having sliding blocks mounted in the top thereof, and the longitudinally-arranged rods attached to the sliding blocks and unitedly operated by a lever to separate the coupling-blocks.

884,841. PROCESS OF PRODUCING SULPHURIC ANHYDRIDE. RUD. HASSEN and MAX SCHRÖDTER, Homburg, Prussia, Germany. Filed Mar. 31, 1888. Serial No. 269,167. (No specimens.) Patented in Germany Feb. 1, 1887, No. 42,315, and in England June 28, 1887, No. 9,168.

Claim.—The process herein described of producing sulphuric anhydride, which consists in reducing the volume of a gaseous mixture of sulphurous acid and oxygen by compression, and subjecting this mixture under pressure to the converting action of a suitable contact-surface at red heat, substantially as set forth.

884,842. FIRE-LIGHTER. WILLIAM HARLOW, St. Louis, Mo. Filed July 15, 1887. Serial No. 244,415. (No model.)



Claim.—1. In a fire-lighter, substantially as described, the combination, with the lighting mechanism having a detent-lever, of means for operating the detent to release said mechanism, which consists of a cord, 31, a spring winding-drum, 26, on which said cord is wound, a lever engaging a notch in said drum, and a weight attached to the end of said detent-lever and held normally in suspension by an arm on the winding-arbor of a clock, to be operated substantially as described.

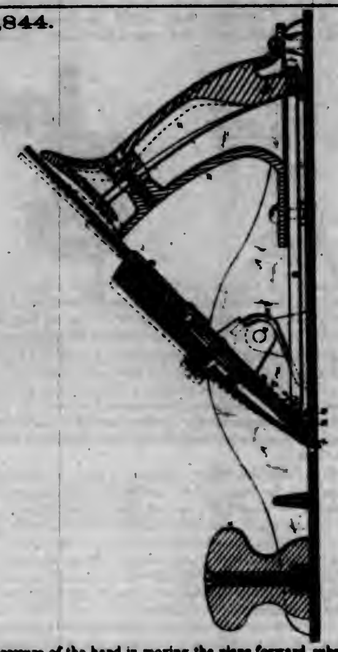
2. The combination of the segment 9, the match-holder 20, a detent, 14, a detent-releasing cord, 31, a winding-drum rotated by a spring, a detent, 26, engaging said drum, a cord connecting the detent to a weight, and an arm on the winding-shaft of an alarm mechanism adapted to support the weight and to release it on the rotating of the alarm-shaft, substantially as set forth.

3. In a fire-lighter, the combination of the frame carrying a revolving segment having a spring and detent lever, means, substantially as described, for operating the detent-lever, and a match-holding device consisting of the tubes 20, fixed in the top plate, 4, of the frame, and springs 22, entering the transverse slots 23 and holding the matches in contact with the rough face of the segment, the said springs having their outer ends formed into the hooks 24, for holding inflammable material, substantially as set forth.

884,843. INCLINED RAILWAY AND WATER-TOBOGGANING APPARATUS. RANDALL A. HAZELTINE, Providence, R. I. Filed Jan. 24, 1888. Serial No. 261,899. (No model.)

Claim.—1. The combination of a descending railway-track and another track furnished with a cable for drawing up the empty cars, a motive power to operate said cable, and a body of water, substantially as set forth, and for the purpose specified.

2. The combination, with an inclined railway-track terminating in a body of water, and a car fitted to go from one to the other, of the drum R, cable C, rope *j*, weight *w*, ratchet-wheel *n*, and pawls *l p*, with lever *k*, substantially as and for the purpose set forth.



3. The shaft *o*, hook *t*, forked bar *y*, arm *v*, and stud *c*, in combination with the cable C, ring *z*, and car A, substantially as described, and for the purpose set forth.

884,844. PLANE. ANSEL S. HAYNES, Rome, N. Y. Filed Mar. 13, 1886. Serial No. 297,978. (Model.)

Claim.—1. The combination, with the body or frame, of a movable cutter-holder, the cutter secured thereto, a connecting-rod, the handle, and a lever loosely connected to both the rod and the handle and adapted to be grasped with the handle, substantially as shown.

2. The combination of the body or frame of the plane, with the pivoted spring-actuated cutter-holder, the cutter secured thereto, a connecting-rod, and a pivoted lever which is operated by the forward pressure of the hand in moving the plane forward, substantially as described.

884,844.

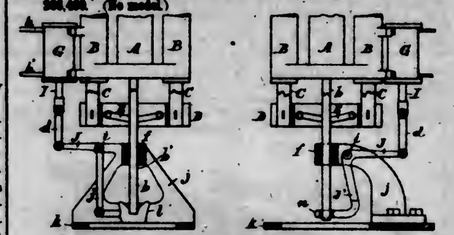
3. The combination of the stationary handle D, the lever E, pivoted thereon, the adjusting set-screw N, the connecting-rod, the pivoted spring-actuated holder, and the cutter, substantially as set forth.

4. The combination of the body or frame of the plane, provided with stops, a spring-actuated cutter-holder provided with stops near its lower end, the cutter secured to the holder, the connecting-rod fastened to the lower end of the cutter-holder, the stationary handle, the lever pivoted upon the handle and connected at its lower end to the connecting-rod, and an adjusting device for regulating the amount of movement which shall be given to the cutter, substantially as specified.

5. The combination, in a plane, of a cutter-holder having a cutter secured thereto, a spring-actuated lever connected to the handle, and a rod which connects the lever and the cutter-holder together, whereby the cutter is depressed by the lever as the plane is forced forward and is returned to position by the spring as the plane is drawn backward, substantially as specified.

884,845. SHOE. WILLIS B. HILL, Lexington, Ohio. Filed Feb. 2, 1888. Serial No. 262,794. (No model.)

Claim.—As an improved article of manufacture, a turned shoe having the front part of the outsole secured to the upper by stitching, the counter having the upwardly-extended rear part and lower inturned edges and the insole, the inturned rear part of the upper,



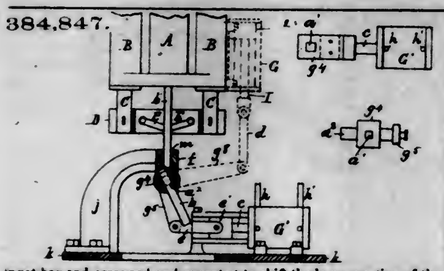
884,845.

together with the inturned lower edges of the counter and the insole, being secured to the outsole by a line of pegs or nails or rivets, *d*, and by a line of stitching, *d'*, extending from the forward termination of said pegs, nails, or rivets *d* to the rear termination of the line of stitching used to secure the forward part of the outsole to the upper before the shoe is turned, the said insole being fastened at rear end only, substantially as described.

884,846. APPARATUS FOR BREAKING STEEL-INGOT BARS. WILLIAM R. KENNEDY, Hoboken, N. J. Filed Mar. 7, 1888. Serial No. 266,402. (No model.)

Claim.—1. In an apparatus for breaking ingot-bars, the combination, with a vertical mold and a vertical cylinder sustained adjacent to the same, of a fixed socket beneath the mold to sustain the ingot-bar during the breaking operation, and a bell-crank with a vertical arm connected to such ingot-bar below the fixed socket, and having a horizontal arm connected with the piston of the vertical cylinder, as and for the purpose set forth.

2. In an apparatus for breaking ingot-bars, the combination, with a vertical mold and a vertical cylinder sustained adjacent to the same, of a fixed socket beneath the mold, an oscillating holder pivoted in the path of the ingot-bar below the fixed socket, and a bell-crank having its vertical arm connected with such holder, and its horizontal arm connected with the piston of the vertical cylinder, as and for the purpose set forth.



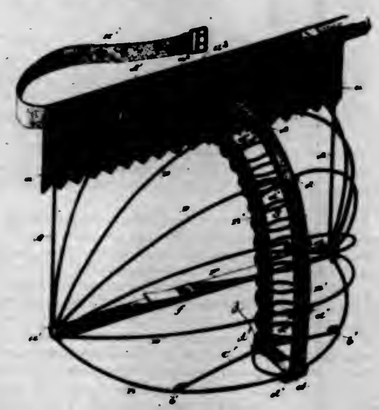
3. In an apparatus for breaking ingot-bars, the combination, with a vertical mold and a vertical cylinder sustained adjacent to the same, of a fixed socket beneath the mold, mechanism operating between the bottom of the mold and the fixed socket for drawing the ingot-bar from the mold, and a bell-crank with a vertical arm connected to such ingot-bar below the fixed socket, and having a horizontal arm connected with the piston of such vertical cylinder, as and for the purpose set forth.

4. In an apparatus for breaking ingot-bars, the combination, with the vertical ingot-mold and vertical cylinder, of a fixed socket beneath the mold, a holder arranged to receive the ingot-bar below the fixed socket and operating by pushing transversely against such bar, and a bell-crank with a vertical arm connected to such transversely-moving holder, and having a horizontal arm connected with the piston of such vertical cylinder, as and for the purpose set forth.

884,847. APPARATUS FOR SEVERING INGOT-BARS. WILLIAM R. KENNEDY, Hoboken, N. J. Original application filed Mar. 30, 1886. Serial No. 266,402. Divided and this application filed Apr. 2, 1888. Serial No. 269,812. (No model.)

Claim.—1. In an apparatus for severing ingot-bars, the combination, with an ingot-casting machine, of a fixed holder in line with the casting-mold, and a movable holder having an aperture fitted to the

384,847.

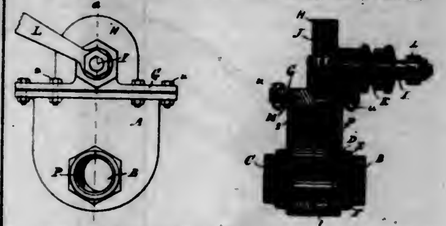


ingot-bar and arranged and operated to shift the lower portion of the ingot-bar transversely at the junction of the two holders, substantially as set forth.

2. In an apparatus for severing ingot-bars, the combination, with an ingot-casting machine, of a fixed holder in line with the casting-mold, and a movable holder having an aperture fitted to the ingot-bar and connected with the piston-rod of a horizontal cylinder arranged and operated to shift the lower portion of the ingot-bar transversely at the junction of the two holders, substantially as set forth.

3. In an apparatus for severing ingot-bars, the combination, with an ingot-casting machine, of a fixed holder in line with the casting-mold, an oscillating holder having its axis transverse to the ingot-bar and provided with an aperture fitted to the ingot-bar, trunnions upon such holder, supports for the same, and an arm connected with the piston-rod of a horizontal cylinder arranged and operated to oscillate such holder upon its trunnions, as and for the purpose set forth.

4. In an apparatus for severing ingot-bars, the combination, with an ingot-casting machine, of a bed-plate arranged beneath the same, a fixed holder attached thereto, a movable holder arranged between the fixed holder and the bed-plate in contact with the fixed holder, and a horizontal cylinder attached to the bed-plate, and the piston-rod of the cylinder connected with the movable holder, as and for the purpose set forth.



384,848. BUSTLE. JOHN H. HOSSETT, Dayton, Ohio. Filed Feb. 9, 1888. Serial No. 263,431. (No model.)

Claim.—1. In a bustle, the combination, with the main bow arched at the top, the cross-wire secured thereto, the base-bow attached to the lower ends of the main bow and having a brace-bow attached thereto, the intermediate bows having the central offsets, with eyes on each side of said offsets, the coiled spring secured at its lower end to the base-bow and brace-bow intermediately to the intermediate bows and at its upper end to the top arch and cross-wire, and the tape passing on the outside, returning under and through the coils of the spring, substantially as described.

2. In a bustle, the combination, with the main supporting-bow, of the base-bow having the brace-bow, the intermediate bows having central offsets with eyes on each side of said offsets, the coiled spring, the spirals of which are attached to the eyes in the said bows, the band or tape passing through the bends of the bows and returning through said spring, the shield attached to the main supporting-bow having waist-belts secured thereto, and adjusting-straps attached to the lower ends of the main supporting-bow, substantially as described

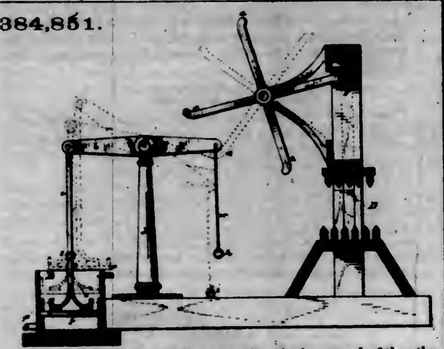
384,849. STRAIGHT-WAY VALVE. HARRISON P. MOSS, Indianapolis, Ind. Filed Apr. 23, 1888. Serial No. 271,887. (No model.)

Claim.—1. In a valve, the hollow valve-case having an opening in one edge to receive the valve and its bearing and openings in two of its sides adapted to receive the ends of a pipe, the interior valve-seat formed around one of said side openings, the disk having cog-teeth on its periphery and an eccentrically-arranged opening which registers with the opening in said valve-seat, the removable cap-plate having a bearing for the disk projecting from its inner side and a hollow chamber on its outer side, the gear-wheel mounted in said chamber and intermeshing with the teeth on the disk, and the shaft, all combined and arranged to co-operate in the manner and for the purpose set forth.

2. In a valve, the hollow valve-case having an opening in one edge to receive the valve and its bearing and openings in two of its sides adapted to receive the ends of a pipe, the interior valve-seat formed around one of said side openings, the removable cap-plate having a bearing for the valve-disk projecting from its inner side and carrying mechanism on its outer side for turning the disk, and the eccentrically-perforated disk arranged to turn in said bearing and to move longitudinally therein when so turned, all combined and arranged to co-operate substantially as specified.

3. In a valve having a valve-case provided with an interior valve-seat and a rotating valve-disk, the combination, with the valve-case and its valve-seat, of a removable cap-plate having a bearing for the rotating valve-disk projecting from its inner side, the valve-disk mounted in said bearing, and mechanism for turning the valve-disk, mounted also on the cap-plate, all arranged substantially as specified, whereby the valve-disk may be removed from the valve-case without disturbing its relation to its bearing or its driving mechanism, substantially as set forth.

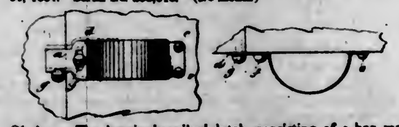
384,850. BUSTLE. ABNER H. JACKSON, Fremont, Ohio. Filed Feb. 11, 1888. Serial No. 263,690. (No model.)



Claim.—The combination of the vertically-disposed frame, the series of three outwardly and downwardly curved coil-springs secured to said frame, the central one of said springs being larger than the other side springs, the coverings or tubes for said springs, the series of horizontally-disposed coil-springs connected at their inner ends to said frame and to each of the springs of said outer series, and the tapes passed through said horizontal springs, connecting said frame and the lower portions of said outer series of springs, substantially as shown and described.

384,851. MACHINE FOR WASHING OUT THE FIBERS OF PLANTS. CHARLES JOHNSON, New Orleans, La. Filed Oct. 31, 1885. Serial No. 181,451. (No model.)

Claim.—In a machine for washing fiber, the combination of a box, a rack secured near its bottom, a post, an eyebolt, a beam pivotally secured to the top of the post, a rod secured to each end of the beam, a rack secured to the lower end of one of the rods adapted to be moved



384,851.

vertically within the box, a ring secured to the lower end of the other rod, adapted to be secured to the eyebolt, and means, substantially as described, for operating the beam.

384,852. LATCH. AUGUSTUS H. JOHNS, Meriden, Conn. Filed Oct. 31, 1887. Serial No. 253,810. (No model.)

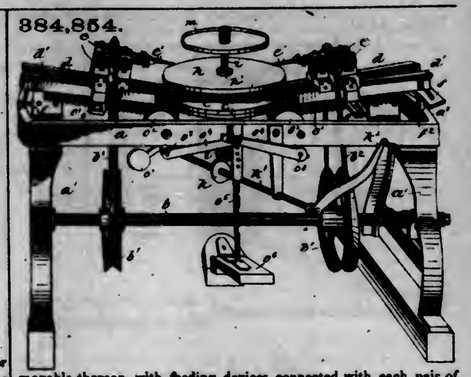
Claim.—The herein-described latch, consisting of a bar made from elastic metal adapted at one end for rigid attachment, the other end constructed to form the nose of the latch, combined with a guide at the nose end, the latch-bar bent transversely between its point of attachment and the guide and out of the plane of the nose of the latch and the point of attachment, substantially as described.

384,853. SPRING FISH-TRAP. GEORGE H. KELLER, New York, N. Y. Filed Dec. 2, 1887. Serial No. 256,747. (No model.)

Claim.—1. The combination of an exterior casing having a line guide or eye at the upper end, a spring-actuated trigger at the lower end, said trigger being provided with a line guide or eye, a spring-barrel at the interior of the casing provided with a notched flange, and upper and lower line-sections attached to the spring-barrel, the lower line-section being provided with a knot for engaging the trigger and releasing the spring-barrel, substantially as set forth.

2. The combination of an exterior casing, a spring-actuated trigger, a spring-barrel having a notched flange, a filling-piece and stop at the side of the spring-barrel, an upper line-section attached to the spring-barrel, and lower line-section also attached to the barrel and provided with a knot for engaging the trigger, substantially as set forth.

384,854. BORING-MACHINE. FRANK B. KEYES, Peterborough, assignor to the Amoskeag Industrial Fibre Ware Company, Manchester, N. H. Filed Jan. 3, 1888. Serial No. 259,660. (No model.)



Claim.—1. In a boring-machine, the combination of a number of guideways and two carriages longitudinally movable thereon, with arbors having their bearings solely on said tool-carriages, as described, whereby the boring-tools operated by said arbors are advanced or fed solely by the movement of said tool-carriages and without longitudinal movement of the arbors in any of their bearings, substantially as described.

2. The combination of a series of converging guideways with pivoted central supports for said guideways and outer supports for said guideways, on which the outer ends of the said guideways are laterally adjustable, as described, whereby the angle between the said guideways may be varied without changing the common center or axis toward which they converge, substantially as described.

3. A series of guideways and tool-carriages moving thereon, the guideways being pivotally supported at one end, combined with vertically-adjustable supports for the other ends of said guideways, substantially as described.

4. The combination of two pairs of guideways and tool-carriages

384,854.

movable thereon, with feeding devices connected with each pair of tool-carriages, and actuating mechanism connected with both said feeding devices, whereby the four tool-carriages are moved on their corresponding guideways simultaneously, substantially as described.

5. The combination of a support and centering device for the article to be bored, with a series of guideways radially arranged with relation to said support, and tool-carriages movable on said guideways, and feed mechanism therefor, substantially as described.

6. The combination of a support and a centering device for the article to be bored, with a sliding shaft for moving said support vertically, and a series of guideways converging toward said support, and tool-carriages moving on said guideways, substantially as described.

7. The two pairs of guideways and tool-carriages movable thereon, combined with the slotted cross-arms engaged with the said tool-carriages, rack-bars connected with said cross-arms, and gears connected with said rack-bars, substantially as described.

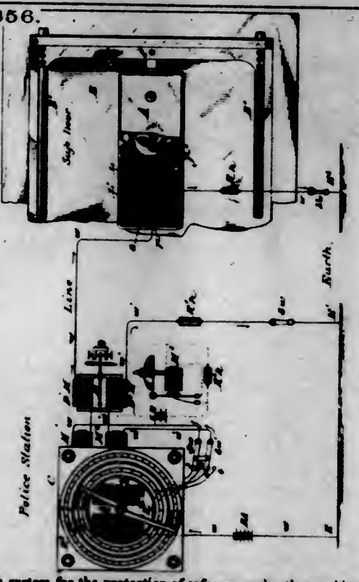
384,855. STRONG BOX OR COFFER. WILLIAM C. KIDNEY, New York, N. Y. Filed Aug. 29, 1887. Serial No. 248,170. (No model.)

Claim.—1. The combination, with a strong box or coffer provided with a cover or door and a lock therefor, with apertures, as *d*, and a pivoted plate, as F, having branches, as *c'*, of keepers, as *c*, mounted on a base and arranged to project through the apertures *d* into said box, said branches *c'* being adapted to engage with said keepers, as set forth.

2. The combination, with a strong box or coffer provided with a cover or door and lock, with apertures, as *d*, and a pivoted plate, as F, having branches, as *c'*, of a plate, as E, provided with keepers, as *c*, to project through said apertures *d* into said box, said branches *c'* being adapted to engage with said keepers, as set forth.

384,856. ELECTRO-MAGNETIC TIME-LOCK. CHARLES J. KINTNER, New York, N. Y. Filed Dec. 5, 1887. Serial No. 256,963. (No model.)

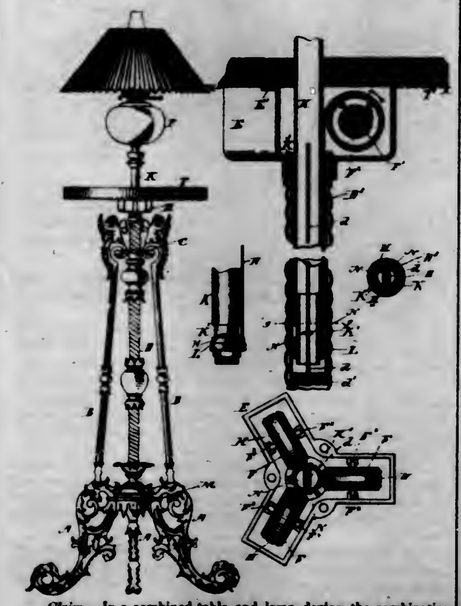
Claim.—1. The combination of a safe-lock and electrical connections with a time mechanism located outside of the safe for controlling the operation of such lock, substantially as described.



2. The combination of a safe-lock with means for holding the gate out of operative relation with the tumblers, with electrical connections and time mechanism for controlling such means, the time mechanism being located wholly without the safe, substantially as described.

3. The combination of a time mechanism located at an outlying station, with an electrical circuit running from said station into a safe or vault at some distant point through an electro-magnet, also located in the safe, for controlling the operation of the lock, substantially as described.

4. The combination of a time mechanism located outside of a safe and having electrical connections running to the interior of said safe, with means for preventing the withdrawal of the bolts until a predetermined time, substantially as described.



5. In a system for the protection of safes and vaults, the combination of a balanced electrical circuit including a time mechanism and an alarm at one point, with bolt-controlling mechanism located inside of a safe or vault at another point, substantially as described.

384,856.

6. In a system for the protection of safes or vaults, the combination of a time mechanism to automatically break a protecting-circuit leading to a distant station at a predetermined time, with electrically-controlled means located within a safe or vault at such distant station for controlling the withdrawal of the bolts, substantially as described.

384,857. COMBINED TABLE AND LAMP. JOSEPH KINTZ, Ballard Vale, Mass., assignor of one-half to the Craighead & Kintz Manufacturing Company, same place. Filed Feb. 23, 1888. Serial No. 264,965. (No model.)

Claim.—In a combined table and lamp device, the combination of the table T, spring-drum F, and strap H with the tube D^3, extension-tube K K', guide-pins N N, bar *d*, and lamp P, all arranged to operate together, substantially as described, and for the purpose set forth.

384,858. CIGARETTE. HENRI F. H. LEBLANC, Paris, France, assignor to Charles C. Dalmonico, New York, N. Y. Filed Jan. 17, 1888. Serial No. 260,984. (No model.) Patented in France May 18, 1885, No. 166,857.

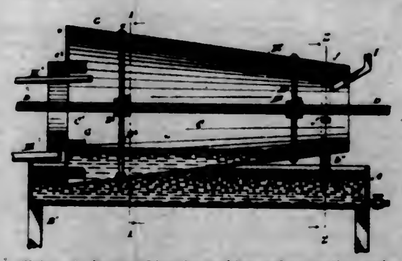
Claim.—1. A cigarette having, in combination, a filling of tobacco, a loose paper wrapper, and a narrow band encircling the wrapper and movable thereon, whereby the band may be slipped along the wrapper as the cigarette is consumed, substantially as set forth.

2. A cigarette having, in combination, a filling of tobacco, a loose paper wrapper, and a narrow paper band encircling the wrapper and movable thereon, whereby the band may be slipped along the wrapper as the cigarette is consumed, substantially as set forth.

384,859. CHECK-REIN-HOOK. ROBERT MASON, Exeter, N. H. Filed Apr. 21, 1888. Serial No. 271,443. (No model.)

Claim.—The combination, with the hook A, of the pin *b*, sliding freely up and down through an aperture, *d*, in the upper portion of said hook and inclined at an angle, as described, and having a stop or enlargement, *g*, at its lower end, adapted when said pin is raised to lie within a countersink, 5, at the bottom of the aperture *d*, substantially as and for the purpose set forth.

384,860. CONDUIT. MERRAM MERRAM, Boston, Mass. Filed June 18, 1887. Serial No. 241,694. (No model.)

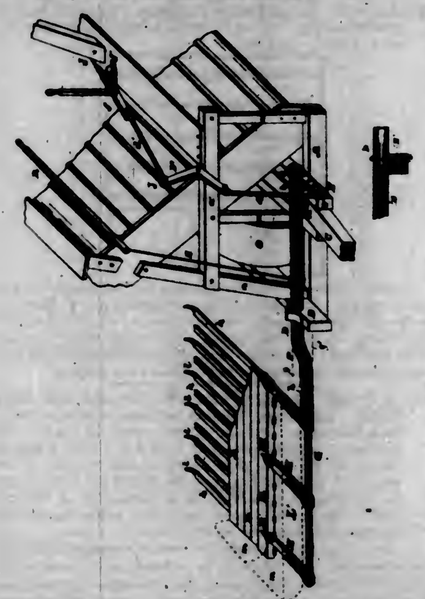


Claim.—1. The combination, with a molded conduit, of the pipe-supports *c*, having concave recesses c' c^2, with drainage-openings c^3 in said recesses, substantially as set forth.

2. The combination, with a molded conduit, of the pipe-supports *c*, having concave recesses c' c^2, with drainage-openings c^3 in said recesses and also below the same, substantially as set forth.

3. The conduit having the cavity B for containing hot-water or steam pipes, electric conductors, &c., and also provided with one or more drain-passages, E, as and for the purposes specified.

384,861. GRAIN-SEPARATOR. FREDERICK MELKERSMAN, St. Charles, Mo. Original application filed July 16, 1887, Serial No. 244,093. Divided and this application filed Dec. 19, 1887. Serial No. 258,396. (No model.)



Claim.—1. In a machine for washing and separating grain, the combination, substantially as hereinbefore set forth, of the water-trough, the conical drum contained therein, a chute for delivering the grain to the interior of the drum at its smaller end, the buckets on the smaller end of the drum for delivering water to the interior thereof, and the buckets on the larger end of the drum and within the same for elevating and delivering the good grain from the drum.

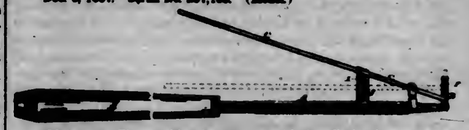
2. In a machine for washing and separating grain, the combination, substantially as hereinbefore set forth, of the water-trough, the conical drum mounted therein, a chute for delivering the grain to the interior of the drum at its smaller end, the buckets on the smaller end of the drum for delivering water to the interior thereof, the buckets on the larger end of the drum and within the same for elevating and delivering the good grain, the inclined perforated table extending into the larger end of the drum to receive the grain from the buckets, and the inclined perforated table for receiving the overflow from the drum.

3. The combination, substantially as hereinbefore set forth, of the water-trough, the conical drum mounted therein with its smaller end above the water-level and its larger end below said level, the buckets on the smaller end of the drum for delivering water to the interior thereof, the flange at the larger end of the drum, the buckets arranged within the drum adjacent to the flange for elevating and delivering the grain, the overflow-rim on the edge of the flange, the table extending within the rim under the lifting-buckets to receive the good grain, and the table below the rim to receive the overflow of water and imperfect grain.

384,862. SHEAF-CARRIER. JACOB HELLER, Canton, Ohio. Filed Sept. 14, 1888. Serial No. 177,869. (No model.)

Claim.—1. The combination, with a harvester-frame, of a shaft journaled in bearings on the front side of the frame, and having a crank-bend, substantially as described, at a point outside of said frame, a sheaf-carrier secured to the shaft at a point outside of the bend therein, an arm secured to said shaft, a foot-lever, and a link connecting the arm and foot-lever, substantially as set forth.

2. The combination, with a hollow shaft mounted on a harvester-frame, and a lever and intermediate connections for rocking said shaft, of a shaft, G, one end of which is removably secured within the outer end of the hollow shaft, and a sheaf-carrier rigidly secured to said shaft G.

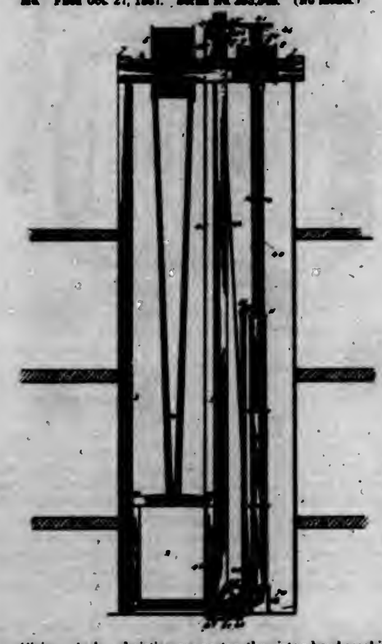


3. The combination, with a harvester-frame, a shaft journaled in bearings on the front end of said frame and having a crank-bend therein at a point outside of the bearings on the frame, and devices for turning the shaft, of a sheaf-carrier rigidly secured to the shaft at a point outside of the bend, the above parts being arranged substantially as set forth, whereby the movement of the dropping-table will be downward and forward, substantially as described.

4. The combination, with a harvester-frame, of a shaft journaled in bearings on said frame, a sheaf-carrier secured thereto, the said shaft having a crank-bend at a point between the bearings on the main frame and the sheaf-carrier, and means for rocking the shaft, whereby the carrier is given a forward movement as the shaft is turned to dump the carrier, substantially as set forth.

5. The combination, with a harvester-frame, of a shaft having a crank-bend therein and supported in bearings, one of which is open and the other constructed to permit the outer end of the shaft to be elevated, a sheaf-carrier secured to said shaft, and means for rocking the shaft, substantially as set forth.

6. The combination, with a harvester-frame, of a shaft journaled thereto and having a crank-bend, the latter being located at a point outside of shaft-bearings on the harvester-frame, and a sheaf-carrier secured to the shaft at a point outside of the bend, the arm E, link *d*, bell-crank F, link d', and lever *f*, substantially as and for the purpose described.



384,863. DENTAL TOOL. JAMES P. MORRIS, Paris, Tex. Filed Dec. 6, 1887. Serial No. 257,102. (Model.)

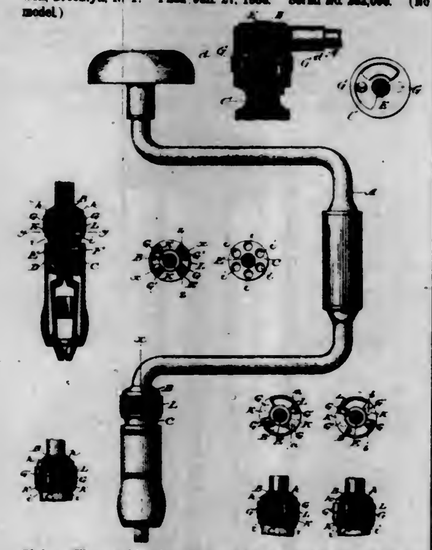
Claim.—1. The combination of a suitable handle having a cup to receive the amalgam connected thereto, an operating-lever, and a plunger for forcing the amalgam from the cup into the cavity in the tooth, substantially as shown.

2. The combination of the handle having a cup formed upon one end to receive the amalgam, the pivoted lever, the plunger placed inside of the cup, and the spring for operating the lever, substantially as described.

384,864. HYDRAULIC ELEVATOR. WILLIAM O'KEEFE, St. Louis, Mo. Filed Oct. 27, 1887. Serial No. 253,545. (No model.)

Claim.—1. In a hoisting apparatus, the piston-head working in a hydraulic cylinder provided with longitudinal way for the passage of water, a valve having a stem in said way, a pin on said stem, a cam for engaging under said pin, and a shaft extending through said piston-head for operating said cam, substantially as and for the purpose set forth.

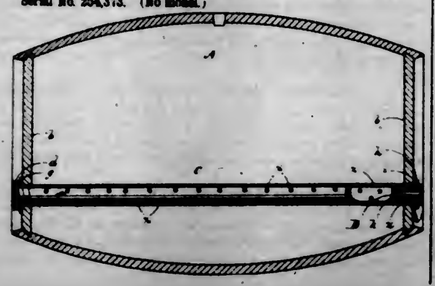
2. In a hoisting apparatus, the combination, with the piston having a water-way from end to end, of a valve and valve-seat interposed in said way, a sleeve having a cam-slot, a stem secured to said valve and against rotation projecting through said sleeve, a pin on said stem engaging in said slot, and a shaft adapted to rotate said sleeve, substantially as set forth.



3. The combination of piston-head 13, having water-way through it, a valve in the lower part of the piston-head governing the water-way, the cam-sleeve 33, with cam-slot, a stud-pin on the valve-stem having bearing in the cam-slot, means for preventing the rotation of the valve-stem, a cog-wheel upon the sleeve, and the shaft 38, carrying

a cog-wheel engaging the wheel upon the sleeve 33, substantially as and for the purpose set forth.

4. The combination, in a hydraulic elevator, of a cylinder, a piston working in said cylinder and having a water-way through it, a valve controlling the water-way, a shaft operating said valve and adapted to move endwise with the piston and through a hydraulic packing in the cylinder-head, and a tubular shaft telescoped upon the said valve-operating shaft, which latter has endwise movement in the tubular shaft and connection therewith enforcing their simultaneous rotary movement, substantially as and for the purpose set forth.



5. The combination of the three valve-stems 29, 54, and 66 of the piston-head valve, the inlet-valve, and the outlet-valve, cam-sleeves on said valve-stems, pins on the stems having bearing in the cam-slots of the sleeves, said slots having circumferential and inclined portions, as set forth, means for preventing the rotation of the valve-stems, the telescoped shaft 38 40, a pulley on this shaft, connected by the operating-cord with a pulley on the shaft 50, and a cog-wheel on shaft 50, engaging cog-wheels upon the cam-sleeves operating the inlet and outlet valves 52 and 64, substantially as and for the purpose set forth.

384,865. PAWL-AND-RATCHET COUPLING FOR BIT-BRACES, &c. HOMER H. PARKER, Winchendon, Mass., assignor to William M. Caldwell, Brooklyn, N. Y. Filed Jan. 27, 1888. Serial No. 262,009. (No model.)

Claim.—The combination, in a tool head or holder formed in two divisions jointed end to end with a butt-joint and pivoted to rotate independently upon a common longitudinal axis, of a ratch formed concentrically in one face of said joint, one or more spring-actuated pawls fitted in the opposite face of the joint to move into and out of engagement with said ratch, and a slotted or perforated annular plate interposed between the pawls and ratch to revolve independently upon said longitudinal axis and control the engagement of the pawls with the ratch, substantially in the manner and for the purpose herein set forth.

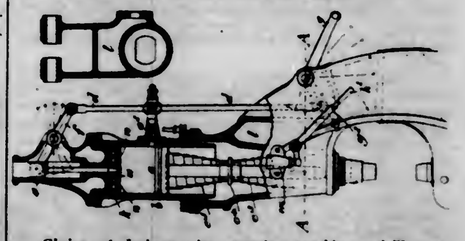
384,866. FAUCET. KNOTT H. FREDRICK, Lynn, assignor of one-fourth to Fred H. Safford, Newburyport, Mass. Filed Nov. 5, 1887. Serial No. 254,373. (No model.)

Claim.—1. The combination of a barrel, a perforated tube extending therethrough, the ends of said tube projecting through the heads of the barrel, one of said ends being provided with an interior screw-thread and both with exterior screw-threads, a screw-threaded cap at one end of said tube outside the head and a nut at the opposite end of said tube outside the head, and a faucet-plug provided with exterior screw-threads which mesh with the interior screw-threads of said tube, provided with a dust and with perforations adapted to register with the perforations of the tube, substantially as described.

2. In a device of the character described, the tube C, provided with the openings *x* and cap *d*, in combination with the plug D, having the holes *v*, duct *h*, and sockets *r*, the faucet E, provided with the studs *l*, and the barrel A, substantially as set forth.

3. The tube C, secured in the heads *b* of the barrel A and provided with the perforations *x*, one end of said tube being closed and the other opening outward through one of said heads and being interiorly screw-threaded, in combination with the exteriorly-screw-threaded plug D, provided with the duct *h* and perforations *v*, said last-named perforations being adapted to register with the perforations *x* when the plug is turned in and to be closed by turning the plug outward, substantially as set forth.

384,867. APPARATUS FOR BLEACHING. WILLIAM R. PHILLIPS, Milford, Delaware. Filed Sept. 4, 1886. Renewed Mar. 16, 1888. Serial No. 267,232. (No model.)

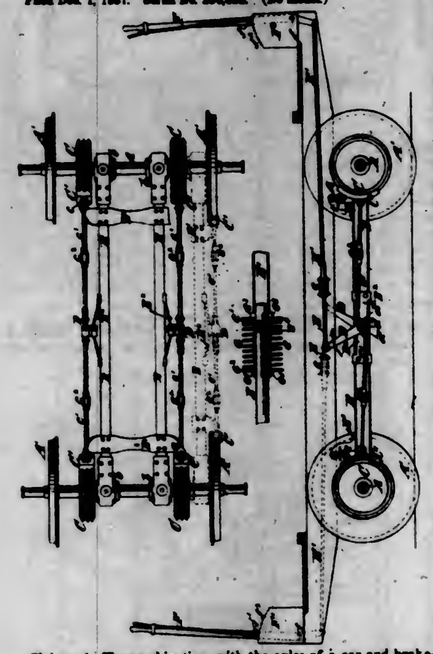


Claim.—In an apparatus for bleaching, the combination of a casing having means for supporting trays, a tube having a swinging door at its lower end and opening into the bottom of the casing with its upper end, a cup for holding burning sulphur fitting in the lower end of the tube, and a steam-boiler having a pipe entering the upper portion of the tube, as and for the purpose shown and set forth.

384,868. PROCESS OF REMOVING FUSEL-OILS FROM CRUDE SPIRITS. JOSÉ PERETA, Guatemala, Guatemala, assignor to Herman Grote, same place. Filed Apr. 30, 1887. Serial No. 236,434. (No specimens.) Patented in France Oct. 18, 1886, No. 178,079; in Belgium Oct. 19, 1886, No. 74,886; in Sweden Oct. 20, 1886, No. 1,068; in Norway Oct. 21, 1886, No. 377; in Spain Nov. 27, 1886, No. 10,126; in Italy Dec. 31, 1886, XX. 20,066, XLI. 188; in Germany Jan. 22, 1887, No. 41,675; in England Feb. 10, 1887, No. 2,109; in Portugal Aug. 4, 1887, No. 1,156, and in Barbadoes Aug. 12, 1887, No. 31.

Claim.—The process herein described of removing fusel-oil and other impurities from crude spirits, or from a mash containing the same, which consists, first, in mixing the crude spirits, or a mash containing the same, with a pulverized purifying compound composed essentially of a mixture of a nitrate and a nitrate of an alkali, and then distilling said spirits or mash, substantially as set forth.

384,869. HAMMERING MACHINERY ACTUATED BY EXPLOSIVE GASEOUS MIXTURES. CHARLES W. PIERSEY, Smethwick, County of Stafford, England. Filed Sept. 20, 1887. Serial No. 250,744. (No model.) Patented in England Feb. 8, 1887, No. 1,966.



Claim.—1. In hammering, stamping, punching, and like machinery actuated by explosive gaseous mixtures, the combination of a cylinder to receive the explosive mixture, a charging-piston and a hammer-piston located in said cylinder, and means, substantially as described, for adjusting the stroke of the charging-piston to vary the charge of the gaseous mixture drawn into the cylinder, and thereby regulate the blow of the hammer-piston, substantially as described.

2. In a gas-hammer or like machine, the combination of the cylinder *b*, charging-piston *a*, hammer-piston *c*, relief-valve A, and cushion-chamber *l*, substantially as described.

3. In a gas-hammer or like machine, the combination of the cylinder *b*, charging-piston *a*, guide *e*, lever *f*, link *d*, and weighted lever *g g'*, substantially as described.

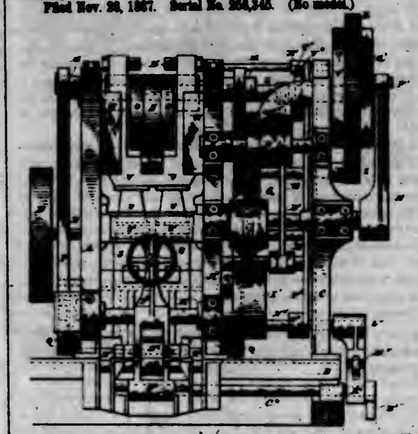
4. In a gas-hammer or like machine, the combination of the cylinder *b*, charging-piston *a*, hammer-piston *c*, exhaust-port *p*, stop *q*, lever *f*, link *d*, and weighted lever *g*, substantially as described.

384,870. CAR-BRAKE. JOHN H. [illegible], New York, N. Y. Filed Dec. 1, 1887. Serial No. 256,688. (No model.)

Claim.—1. The combination, with the axles of a car and brake-shoes for acting on wheels or drums on the two axles at opposite sides of the car, of levers D, fulcrumed at opposite sides of the car and each having short arms *d'*, connected by rods *e* with the brake-shoes at that side of the car, and brake-applying devices at opposite ends of the car connected, respectively, one to each of the levers D, substantially as herein described.

2. The combination, with a brake-shoe acting upon a wheel or drum upon a car-axle and a lever connected with the shoe for operating it, of a brake-applying device at the end of the car, and a rod connecting the said brake-applying device and lever and composed of two sections, one receiving the other within it, a spiral spring, and collars bearing against opposite ends of the spring and fastened, respectively, to the inner and outer rod-sections, substantially as herein described.

384,871. PULLEY. ALBERT P. SIBLEY, South Bend, Ind., assignor to Sibley & Ware, same place. Filed Jan. 16, 1888. Serial No. 260,912. (No model.)



Claim.—1. In a band-pulley, the combination, with a hub, of radial arms secured thereto and provided with screw-threads on their outer ends, a rim, and metallic nuts D, embedded in the rim, the outer screw-threaded ends of the said radial arms working in the said embedded nuts, substantially as described.

2. In a band-pulley, the combination of a hub, radial arms secured thereto and provided with screw-threads on their outer ends, a rim, metallic nuts D, embedded in this rim and adapted to receive the outer screw-threaded ends of the said radial arms, and washers and jam-nuts on the outer screw-threaded portions of the said radial arms, substantially as described.

3. In a pulley, the combination of the two-part hub provided with radial shouldered apertures, the arms B, inserted in these apertures, the said arms being provided with heads c on their inner ends and screw-threads on their outer ends, a rim, C, nuts embedded in this rim and adapted to secure the screw-threaded ends of the arms B, and jam-nuts F, substantially as herein described.

4. In a pulley, the combination of the hub provided with arms B, these arms being screw-threaded at their outer ends, a rim, C, constructed of segmental sections *d*, secured together, metallic nuts D, embedded in recesses in the sections of the rim and adapted to receive the outer screw-threaded ends of the arms B, and jam-nuts and washers, as set forth.

384,872. BRICK-MACHINE. PETER L. SIMPSON, Minneapolis, Minn. Filed Nov. 30, 1887. Serial No. 256,345. (No model.)

Claim.—1. In a brick-machine, an adjustable and movable stop, a lower plunger supported thereon in the mold while the same is being filled with clay and during a portion of the pressing action, said stop adapted to be withdrawn to allow the upper and lower plungers and the partially-pressed clay to move downward within the mold, and a permanent stop to support the same before the final pressure of the upper plunger is applied, substantially as and for the purpose set forth.

2. A brick-machine the upper plungers of which are secured to a yoke working in suitable ways, said yoke being raised by cams having an abrupt termination, whereby the yoke and the plungers are allowed to fall suddenly, the plungers entering the mold to compact the clay prior to receiving the final pressure, as set forth.

3. In a brick-machine, the upper plungers which are secured to a yoke working in suitable ways, said yoke being raised by cams having an abrupt termination to allow the yoke and plungers to fall suddenly on the clay within the mold, in combination with an additional cam for forcing the upper plungers down to execute the final pressure on the top of the brick, as set forth.

4. In a brick-machine of the character described, the shaft L, provided with a cam, N, for moving the upper plungers downward to exert pressure on the brick, and with cams O, for raising said plungers, the cams O being so arranged and timed in their movements that they will operate to raise the plungers after they have been carried up out of the molds, as set forth.

5. In a brick-machine of the character described, the upper plungers secured to a yoke, V, said yoke being provided with pins, studs, or friction-rollers B, and adapted to slide in ways W, in combination with the cams O and shaft L, as set forth.

6. In a brick-machine, the rocking arm E', secured to the levers H' and I' in the manner described, in combination with the wheel K, provided with cam-groove G', whereby the lower plungers are raised to eject the brick from the mold, as set forth.

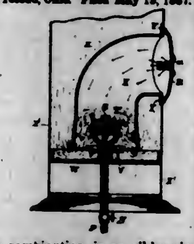
7. In a brick-machine, the rocking arm E', adapted to raise the lower plungers, said arm being provided with an adjustable pin adapted to engage a cam-groove in the wheel K, whereby the throw of said arm is regulated, as set forth.

8. In a brick-machine, the rocking arm E', provided with segmental slot F', and the block O', carrying the pin F', adapted to slide in said slot, in combination with the screw-rod Q' and hand-wheel R', whereby the pin F' is adjusted and held at any desired point in the slot, as set forth.

9. In a brick-machine, the wedge E⁵, pivoted to the adjustable lever F⁵ and supporting the rubber cushion A⁴, in combination with the rocking arm D⁴ and the mechanism for operating the same, whereby the rubber block or cushion is lowered during the pressing operation to allow the cross-head of the lower plungers to come in contact with rigid or permanent stops before the final pressure is applied to the top of the brick.

10. The shaft C⁵, provided with the weighted lever A⁵ and the arm D⁴, in combination with the pivoted block E⁵, block I⁴, and rubber cushion A⁴, as and for the purpose set forth.

11. In a brick-machine, the combination of the lower plungers provided with the oil-ducts and carrying the oil-reservoir thereon, with a floating piston, and a suitable bracket or stop for forcing the piston down into the reservoir, whereby the molds are oiled automatically at each upward movement of the lower plungers.



12. In a brick-machine of the character described, the cam N, provided with a surface of different radii, one of which forces the upper plunger down to press the upper side of the brick, while the other surface diminishes or retreats in its radius to allow the upper plunger to retreat during a portion of the pressing operation, in combination with the lower plunger, toggle-levers, and devices, substantially as described, for operating said levers, whereby the upper plunger is checked in its upward movement, forming a moving resistance to the clay while being pressed on the under side by the lower plunger, as set forth.

13. The combination of the cam N, having the retreating surface from 2 to 3, adapted to impinge on the top of the upper plunger, with the rods P, levers Q, toggles R, and plungers S, whereby the upper plungers are permitted to recede at a lower rate of speed than the upward movement of the lower plunger, and the whole body of the clay moved in the mold during the pressing operation, as set forth.

14. In a brick-machine, a cam provided with a surface of different radii, one of which forces the one plunger to press the one side of the brick, while the other surface diminishes or retreats in its radius, so as to allow the other or opposite plunger to advance and exert the final pressure on the brick.

384,873. APPARATUS FOR BURNING CRUDE PETROLEUM-OIL.

ROBERT W. BATTS, Toledo, Ohio. Filed May 19, 1887. Serial No. 238,704. (No model.)

Claim.—1. The combination, in an oil-burning apparatus, of a stove, a downdraft-flue therein, an escape-pipe for the products of combustion, an oil-supply tank, a supply-pipe connected therewith, and an oil-cup mounted on the supply-pipe or oil-connection in the flue and provided with an adjustable cap for admitting oil to flow upwardly through and over the top of said cup, substantially as set forth.

2. The combination, in an oil-burning apparatus, of a stove, a downdraft-flue therein, an escape-pipe for the products of combustion, an oil-supply tank, a supply-pipe connected therewith, a filter interposed in the supply-pipe, and an oil-cup mounted on the oil-supply pipe or oil-connection and provided with an adjustable cap for admitting oil to flow upwardly through and over the top of said cup, substantially as set forth.

3. The combination, in an oil-burning apparatus, of a stove body or barrel, its downwardly-projecting draft-flue, a draft-opening at its upper end, and an oil-cup in the flue, having an oil-connection or supply-pipe in its bottom and an adjustable cap at its top, substantially as set forth.

4. The combination, in an oil-burning apparatus, of a stove body or barrel, its downwardly-projecting draft-flue, a draft-opening at its upper end, an oil-cup in the flue, having an oil-connection or supply-pipe in its bottom and an adjustable cap at its top, a drip-tray beneath the oil-cup, and a diaphragm beneath the drip-tray, substantially as set forth.

5. The combination, in an oil-burning apparatus, of a stove body or barrel, its downwardly-projecting draft-flue, and an oil-cup with an oil connection or opening in its bottom for admitting oil to flow upwardly over the top of said cup, and an adjustable cap to regulate said flow, substantially as set forth.

384,874. WATER-FEEDER.

CHARLES A. SEVERANCE, Peabody, Mass. Filed Aug. 15, 1887. Serial No. 246,986. (No model.)

Claim.—The water-feeder, as described, consisting of the water-supply *c* and reservoir *b*, the pipe *d d'*, connecting the same, the valve D', arranged on said pipe and having pipe *f* entering the water-space of the boiler *a*, the pipe *f e*, leading from the upper portion of the reservoir *b* to the boiler *a*, and terminating within the latter at the normal level of the water in said boiler, and having the valve C' arranged upon said pipe, as described, the said valves C' D' being connected by means of the weighted levers *c' d'* and rod A, combined with the float *b'*, arranged within the reservoir *b*, the float-rod *b''*, having collars B' B² B³ B⁴, and the weighted rocking lever K L, substantially as and for the purpose set forth.

384,875. ELECTRIC FIRE-ALARM APPARATUS.

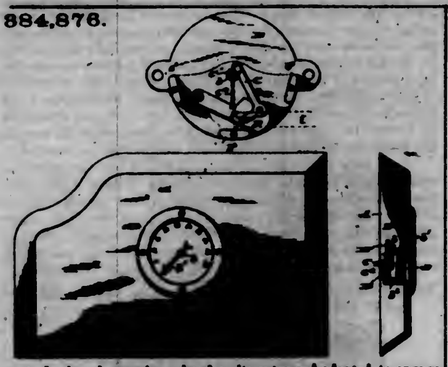
GEORGE H. SEVERS, Cambridge, Mass. Filed Mar. 12, 1888. Serial No. 267,088. (No model.)

Claim.—1. In an electric signal-box, the combination of a door provided with a projection, H, a pivoted lever, *c d*, having an arm, *c*, to swing in a vertical plane, and located in said box, and provided with a pin, *f*, to engage with said projection, said lever being thus held against the action of gravity between the lever D to be pulled for giving an alarm and the device for releasing the mechanism for making and breaking the circuit, substantially as set forth.

2. The combination, in an electric signal-box, of an electro-magnet, F, armature and lever G therefor, lever *c d*, provided with a projection or pin, *r*, and projection *e*, lever D to be pulled for giving an alarm, and the releasing-lever *j k*, substantially as set forth.

3. The combination of the outer door provided with a projection, H, a lever, *c d*, having an arm, *c*, to swing in a vertical plane, and provided with a pin, *f*, to engage with said projection, and also provided with a projection or pin, *r*, an electro-magnet and armature and lever G therefor, and a lever, D, pivoted to the inner door, substantially as set forth.

4. The combination of the lever *c d*, having an arm, *c*, to swing in a vertical plane, and swung by the outer door and upheld by a magnet, armature and lever G, a lever, D, to be pulled for giving an alarm, and a releasing device, as the lever *j k*, substantially as and for the purpose set forth.

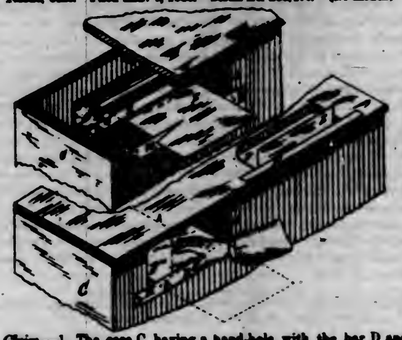


384,876. OVEN-THERMOMETER.

JOHN STINEMAN, Rochester, Pa. Filed Dec. 15, 1887. Serial No. 257,893. (No model.)

Claim.—1. The combination, with the oven-door, of the plates B and B', central arbor, *b*, bell-crank lever C, having wrist-pin *c* on its lower end, chains C' and C², gravity-lever D, and the bars E, all arranged and operating substantially as described.

2. The combination, with the oven-door, of the plates B and B', the central arbor, *b*, carrying a hand on its outer end adapted to engage with the dial-plate, the bell-crank lever C, having the upper end of its longer arm provided with a series of apertures, the chain C', connected at its upper end to said arm of the bell-crank lever and passing around the arbor *b*, the gravity-lever D, secured to the lower end of a chain, C², which is also secured to the arbor *b*, the bars E, pivotally secured to the oven-door at their outer ends and formed with bevels at their inner opposing ends, and an angular clip, within which the inner opposing ends of the said bars E rest, substantially as described.



384,876.

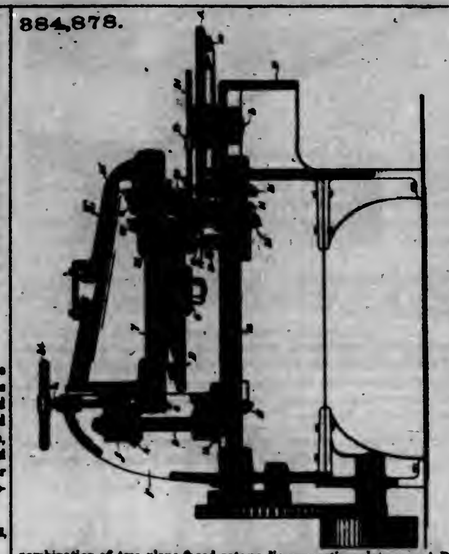
central arbor, *b*, carrying a hand on its outer end adapted to engage with the dial-plate, the bell-crank lever C, having the upper end of its longer arm provided with a series of apertures, the chain C', connected at its upper end to said arm of the bell-crank lever and passing around the arbor *b*, the gravity-lever D, secured to the lower end of a chain, C², which is also secured to the arbor *b*, the bars E, pivotally secured to the oven-door at their outer ends and formed with bevels at their inner opposing ends, and an angular clip, within which the inner opposing ends of the said bars E rest, substantially as described.

384,877. ROLL-PAPER-SERVER MACHINE.

KIRK O. ST. JOHN, Toledo, Ohio. Filed Mar. 7, 1888. Serial No. 266,477. (No model.)

Claim.—1. The case C, having a hand-hole, with the bar D and its tensional device K substantially adjacent thereto, and the severer M, in combination with a roll upon which paper is wound, and means adapted to act upon a varying curve to produce a uniform tension upon said paper as it is being unwound, in the usual manner, from the said roll, substantially as shown and described.

2. The case C, having a hand-hole and a severer substantially adjacent thereto, in combination with a roll upon which paper is wound, and means adapted to act upon a varying curve to produce a uniform tension upon said paper as it is being unwound, in the usual manner, from the said roll, substantially as shown and described.



3. The case C, having a hand-hole, with a bar, D, and its tensional device K substantially adjacent thereto, and the severer M, in combination with a roll upon which paper is wound, substantially as shown and described.

4. A paper-serving device having a hand-hole and a severer substantially adjacent thereto, in combination with means for giving necessary tension to the said paper, whereby the said paper is adapted to be clutched by the hand of the operator through the said hand-hole and severed on a line substantially flush with the hand-entering side of said device, substantially as shown and described.

5. A paper-serving device consisting of a roll upon which a scroll of paper is wound, and a tensional device, such as shown, adapted to operate upon said scroll to produce a uniform tension upon said paper as it is being unwound from the said roll, in combination with a severer, substantially as shown and described.

384,878. MACHINE FOR ROLLING METAL ARTICLES TO FORM.

CHARLES F. TOMPKINS, Fitchburg, Mass., assignor to the Tubbette Rolled Forging and Machine Company, Kinney, Me. Filed Dec. 15, 1887. Serial No. 257,892. (No model.)

Claim.—1. In a machine for rolling metal articles to form, the combination of two plane-faced rotary die-supporting platens, as A B, a two-part forming-die mounted, one member on the plane face of one and the other member on the opposing plane face of the other platen, and means for rotating the platens progressively, to bring the co-operating die members up to and past each other repeatedly, substantially as described.

2. In a machine for rolling metal articles to form, two pivotally-supported plane-faced rotary die-supporting platens, one or more two-part forming-dies, one member of each die being mounted on the plane face of one and the co-operating members on the opposing plane face of the other platen, and means for rotating the platens progressively, substantially as and for the purposes described.

3. In a machine for rolling metal articles to form, the combination of two die-supporting platens and a series of two-part forming-dies, one member of each die being mounted on one and the co-operating members on the opposing faces of the other platen, respectively, and supporting and operating mechanism whereby the platens are moved progressively to make the die members approach and pass each other, substantially as described.

4. In a machine for rolling metal articles to form, the combination of two plane-faced rotary die-supporting platens, as A B, a two-part forming-die mounted, one member on the plane face of one and the other member on the opposing plane face of the other platen, and means for rotating the platens progressively, to bring the co-operating die members up to and past each other repeatedly, and a gage for supporting the metallic rod operated on between the dies, substantially as described.

5. In a machine for rolling metal articles to form, the combination of two plane-faced rotary die-supporting platens, as A B, a two-part forming-die mounted, one member on the plane face of one and the other member on the opposing plane face of the other platen, and means for rotating the platens progressively, to bring the co-operating die members up to and past each other repeatedly, and an adjustable gage for supporting the metallic rod operated upon between the dies, substantially as described.

6. In a machine for rolling metal articles to form, the pivotally-supported die-platens A B and dies mounted on the faces thereof, combined with the supporting-rolls 25, arranged to bear upon the platens, and means for rotating the platens, substantially as set forth.

7. In a machine for rolling metal articles to form, the die-supporting platens A B, the dies *a a*, mounted on the faces thereof, the gears 8 11, engaging the platens, as described, the supporting-rolls 25, shafts 7 12, and connecting and operating mechanisms, in combination, substantially as set forth.

8. In a machine for rolling metal articles to form and in combination, substantially as set forth, the standard F, the bracket-arm E, supported movably on said standard, and the die-supporting platens and operating mechanisms, substantially as described.

384,879. HOE.

SAMUEL H. T. THURMAN, Worcester County, Md. Filed Feb. 28, 1888. Serial No. 265,694. (No model.)

Claim.—1. A hoe having a toothed edge, the teeth being sharp-

384,878.

combination of two plane-faced rotary die-supporting platens, as A B, a two-part forming-die mounted, one member on the plane face of one and the other member on the opposing plane face of the other platen, and means for rotating the platens progressively, to bring the co-operating die members up to and past each other repeatedly, substantially as described.

2. In a machine for rolling metal articles to form, two pivotally-supported plane-faced rotary die-supporting platens, one or more two-part forming-dies, one member of each die being mounted on the plane face of one and the co-operating members on the opposing plane face of the other platen, and means for rotating the platens progressively, substantially as and for the purposes described.

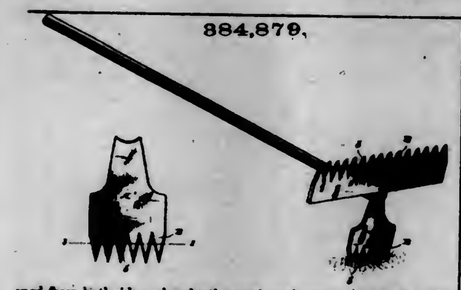
3. In a machine for rolling metal articles to form, the combination of two die-supporting platens and a series of two-part forming-dies, one member of each die being mounted on one and the co-operating members on the opposing faces of the other platen, respectively, and supporting and operating mechanism whereby the platens are moved progressively to make the die members approach and pass each other, substantially as described.

4. In a machine for rolling metal articles to form, the combination of two plane-faced rotary die-supporting platens, as A B, a two-part forming-die mounted, one member on the plane face of one and the other member on the opposing plane face of the other platen, and means for rotating the platens progressively, to bring the co-operating die members up to and past each other repeatedly, and a gage for supporting the metallic rod operated on between the dies, substantially as described.

5. In a machine for rolling metal articles to form, the combination of two plane-faced rotary die-supporting platens, as A B, a two-part forming-die mounted, one member on the plane face of one and the other member on the opposing plane face of the other platen, and means for rotating the platens progressively, to bring the co-operating die members up to and past each other repeatedly, and an adjustable gage for supporting the metallic rod operated upon between the dies, substantially as described.

6. In a machine for rolling metal articles to form, the pivotally-supported die-platens A B and dies mounted on the faces thereof, combined with the supporting-rolls 25, arranged to bear upon the platens, and means for rotating the platens, substantially as set forth.

7. In a machine for rolling metal articles to form, the die-supporting platens A B, the dies *a a*, mounted on the faces thereof, the gears 8 11, engaging the platens, as described, the supporting-rolls 25, shafts 7 12, and connecting and operating mechanisms, in combination, substantially as set forth.

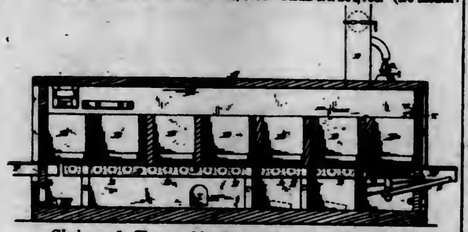


8. In a machine for rolling metal articles to form and in combination, substantially as set forth, the standard F, the bracket-arm E, supported movably on said standard, and the die-supporting platens and operating mechanisms, substantially as described.

384,879. HOE.

SAMUEL H. T. THURMAN, Worcester County, Md. Filed Feb. 28, 1888. Serial No. 265,694. (No model.)

Claim.—1. A hoe having a toothed edge, the teeth being sharp-

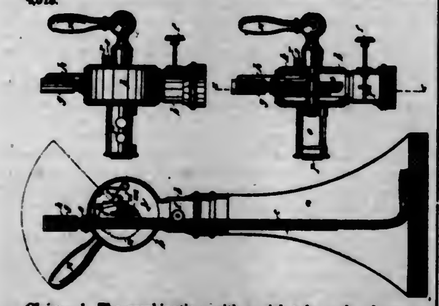


384,879.

ened from both sides, whereby the cutting-edges are between the plain faces of the teeth and parallel therewith, substantially as and for the purpose described.

2. A weeding-hoe having its edge provided with narrow teeth, beveled from both sides to form sharp edges between the plain faces of the teeth, the spaces between the teeth being wedge shape and of a depth greater than the distance between the points of the teeth, whereby weeds and grass may be wedged between the teeth and pulled, substantially as described.

384,880. APPARATUS FOR BLEACHING FRUIT. ASAHEL TODD, Palmyville, N. Y. Filed Feb. 21, 1888. Serial No. 264,782. (No model.)



Claim.—1. The combination of the frame A, provided with a series of horizontal rollers, and the boxes B, having open bottoms, so that the sulphur-fumes will rise through the fruit contained therein, with the hinged partitions J, which are placed in the chamber underneath the boxes, and in which the sulphur-fumes are generated, substantially as described.

2. The combination of the frame A, provided with horizontal supports upon which the boxes containing the fruit are placed, and having a chamber or space above the boxes for a free circulation of air, and a chamber below the boxes in which the sulphur-fumes are generated, with the hinged partitions J, the bellows located at one end, and a ventilating-pipe, P, substantially as set forth.

3. The combination, with the frame and the boxes which are to be filled with the fruit, of the trough through which the fruit is fed into the boxes, and the V-shaped leveling device placed in the frame just above the top of the boxes, substantially as described.

384,881. COMBINED LAMP AND CIGAR-CUTTER. OTTO VOLKMANN, Köpenick, near Berlin, assignor to Wilhelm Fischbach, Berlin, Germany. Filed Dec. 22, 1887. Serial No. 258,708. (No model.) Patented in Germany July 3, 1883, No. 25,699; in Austria-Hungary Nov. 7, 1886, No. 40,681 and No. 16,905, and in England Mar. 27, 1886, No. 4,312.

Claim.—1. The combination, with a wick-tube and a sleeve surrounding the upper end of said tube and movable thereon in the direction of its length, of a lever, *h*, connected with said sleeve, a shaft, *d*, having a projection for actuating the lever to lower the sleeve, and springs *l* and *n*, to return the lever and shaft to normal position and raise the sleeve when the shaft is released, substantially as described.

2. The combination, with a wick-tube and *p* sleeve surrounding the upper end of said tube and movable thereon in the direction of its length, of a lever connected with said sleeve, a shaft having a projection for actuating the lever, and stops, one of which is adjustable, for limiting the movement of the shaft and controlling the upward and downward movement of the sleeve, substantially as described.

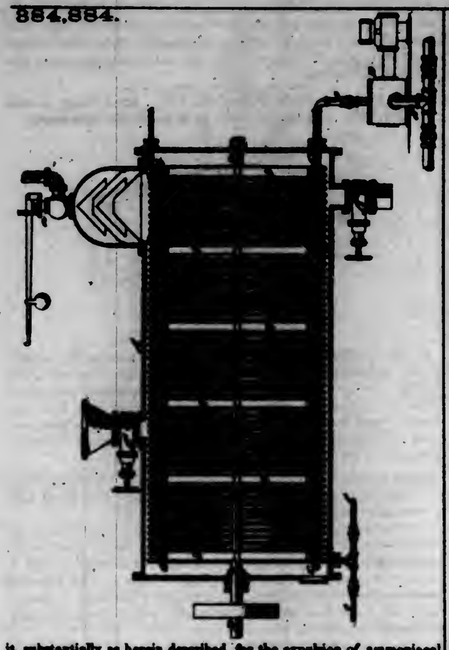
3. A cigar cutter and lighter consisting of an oil-reservoir, a casing, *b*, and having a projection mounted thereon, a wick-tube passed through said casing, a sleeve surrounding the upper end of said tube and movable thereon in the direction of its length, a lever connected with said sleeve and inclosed in the casing *b*, a shaft, *d*, mounted in the casing *b* to actuate said lever, and a cigar-cutter connected with and actuated by said shaft, substantially as described.

384,882. BACK-BAND HOOK. SIDNEY WARD, Princeton, Ind. Filed Apr. 30, 1888. Serial No. 272,388. (No model.)

Claim.—1. As an improved article of manufacture, a back-band hook formed of a single piece of metal and consisting of the cross-bar B, provided with rivet-holes, the depending converging side bars, C, connected by the rounded portion D, the guards F, formed upon the inner vertical edges of the said side bars and extending nearly their entire length, these guards being carved on their outer edges, as described, and the hook E, formed on the face of the connecting portion D and terminating between the flanges about on a horizontal line with their highest portions, substantially as herein set forth.

2. As an improved article of manufacture, a back-band hook constructed of a single piece of metal and consisting of the cross-bar B, provided with rivet-holes, the depending side bars provided with guards and connected together by portion D, and the hook E, the said cross-bar B being provided with circular depressions *c* in its under side and circular bosses *d* on its face, these depressions and bosses surrounding the rivet-holes in the cross-bars, as and for the purposes herein set forth.

384,883. VALVE. EDWIN F. WILLIAMS, Chicago, Ill. Filed Aug. 20, 1887. Serial No. 247,499. (No model.)



Claim.—1. The combination, with the steam-chest provided with the central live-steam space and exhaust-steam spaces at each end, with end-bearing ribs above the same, of the independent pressure-plates, arranged one at each end of the chest within the central space above the valve and held against the bearing-ribs by the steam-pressure, substantially as and for the purposes specified.

2. The combination, with the steam-chest A, having valve-seats *a*, distance-ledges D on each side of each valve-seat, and bearing-ribs *f'*, one at each end, of the valve E, having a height equal to that of the distance-ledges, and the pressure-plates F, mounted on the distance-ledges and bearing against the ribs *f'*, substantially as and for the purposes specified.

384,884. MANUFACTURE OF BICARBONATE OF SODA. HILTON R. WEBB, Brooklyn, N. Y. Filed Nov. 30, 1886. Serial No. 220,344. (No specimens.)

Claim.—1. The within-described improvement in the purification of the crude bicarbonate of soda obtained by the ammonia process, consisting in mixing said crude bicarbonate with sufficient water to make a mixture of a semi-fluid or cream-like consistency, and heating the said mixture to a temperature of about from 190° to 210° Fahrenheit while it is subjected to pressure by forcing air into and through

384,884.

it, substantially as herein described, for the expulsion of ammoniacal impurities.

2. The within-described improvement in the manufacture of bicarbonate of soda by the ammonia process, consisting in mixing the crude bicarbonate of soda resulting directly from that process with sufficient water to make a mixture of a semi-fluid consistency, heating the said mixture to a temperature of about 190° to 210° Fahrenheit, and while so heated forcing air into or through it for the purpose of expelling the excess of ammoniacal impurities, and afterward forcing through it carbonic-acid gas for the purpose of replacing the carbonic acid which may have been driven off by the air previously forced through it, all substantially as herein described.

384,885. NUT-LOCK. LEE ARMSTRONG, Paris, Tex., assignor of one-half to Thomas Brand, same place. Filed Feb. 21, 1888. Serial No. 264,802. (No model.)

Claim.—1. In a nut-lock, the plate having the outstanding lugs, the retaining-arms pivoted to one of said lugs, the detent between said lugs, and the locking-bolts having the head portion and the corrugated shank, substantially as specified.

2. The nut-lock consisting of the bearing-lug B, the grooved lug B', the arms C, pivoted to the lug B, the free ends entering the grooves *c*, the detent on the plate, the locking-bolts having the corrugated shank, and the head provided with the V-shaped opening, in combination with the plate, the nut, and the bolt, substantially as specified.

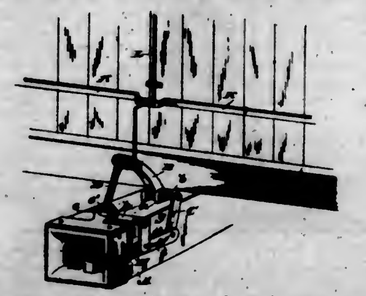
384,886. CASTER. EDWARD G. ALLEN, Milwaukee, Wis., assignor of one-half to Charles J. Walker, same place. Filed June 28, 1888. Serial No. 168,544. (No model.)

384,886.

Claim.—1. In a caster, the combination of a stationary base having an annular track, a wheel-frame provided with a flange overhanging and retaining it in connection therewith, a pivotal stud upon which said wheel-frame is fulcrumed and retained in its central position with reference to said base, a caster-wheel journaled in said wheel-frame, and a friction roller or rollers interposed between said flange and base, substantially as and for the purposes set forth.

2. The combination, in a caster, of the base-plate A, wall B, formed separate therefrom and secured thereto by eyelets C, eyelets C, wheel-frame D, and caster-wheel F, substantially as and for the purposes set forth.

384,887. CHAIR. JOHN R. ROOT, Long Meadow, Mass., assignor to William W. Cosmer, same place. Filed Mar. 11, 1886. Serial No. 194,611. (No model.)

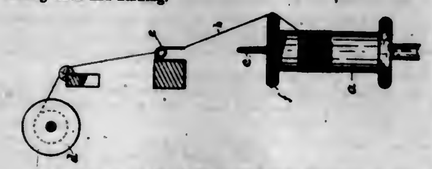


Claim.—1. As a new article of manufacture, a brace for chair-legs, cast in a single piece, consisting of a rectangular frame of four rounds united at the ends by hollow sleeves open at both ends to take and hold the legs of a chair below the seat thereof, substantially as described.

2. The brace for chair-legs herein described, consisting of a rectangular frame of four rounds united at the ends by hollow sleeves open at both ends to take the legs of a chair below the seat thereof, and formed with diagonally-arranged braces having their ends in the sleeves, substantially as described.

384,888. WITHDRAWN.

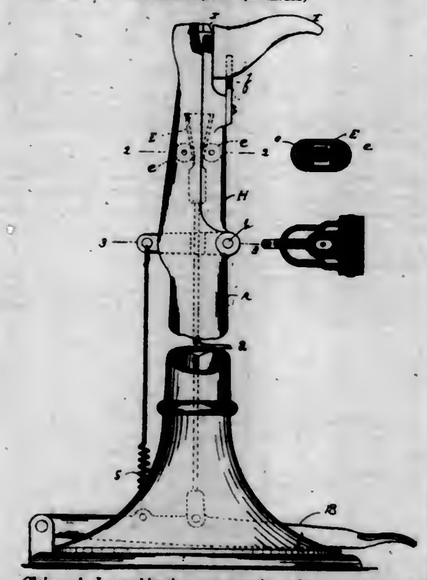
384,889. CAR-COUPLING. SAMUEL C. CARROLL, Adamsville, Tenn., assignor of one-half to W. R. Hesting and G. W. Thacker, both of same place. Filed Apr. 19, 1888. Serial No. 271,197. (No model.)



Claim.—1. In a car-coupler, the combination, with the draw-head A, having an arm which carries a coupling-pin pivoted thereto, of a sliding bar having one end projecting beyond the draw-head, a pivoted angle-bar connected to the sliding bar, and a bar, C, for connecting the same to the pivot-pin of the arm B, the parts being organized substantially as shown, and for the purpose set forth.

2. The combination, in a car-coupler, of an arm, B, having a coupling-pin pivoted thereto, a pivot-pin, *b*, mounted in suitable bearings upon the draw-head and provided with a bar, C, an angle-bar, H, having a notch, *h'*, a link for connecting said angle-bar to a sliding bar, F, and spring *g*, interposed between the draw-head and sliding bar, the parts being organized substantially as shown, and for the purpose set forth.

3. The combination, in a car-coupler, of a draw-head provided with upwardly-projecting perforated lugs *c c*, a band encircling the draw-head and provided with a rearward projection, *e*, having a perforation surrounded by an upward flange, an angle-bar, A, pivoted to the projection *e*, a sliding bar, F, having inwardly-bent end, a link, *i*, for connecting the angle-bar to the sliding bar, said sliding bar being connected to the pivot-pin of the arm B, and a coupling-pin, D, the parts being organized substantially as shown, and for the purpose set forth.

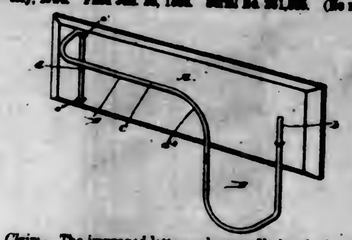


884,890. KINK-PREVENTER FOR SILK-SPINNING MACHINES. JOSEPH A. CHAPMAN, New London, Conn. Filed Oct. 20, 1887. Serial No. 253,754. (No model.)

Brief.—When the bobbin is stopped, the strand falls against the plush thereon, and is thereby prevented from slipping forward and becoming slack and kinking.

Claim.—A bobbin for silk-spinning, having the flange or head at the delivery end grooved annularly and having fixed within said groove a ring of plush or similar material, whose nap projects outward into the path of the strand of silk, substantially as and for the purpose specified.

884,891. LASTING-JACK. GEORGE H. CLARK, Boston, Mass. Filed Sept. 19, 1887. Serial No. 249,668. (No model.)



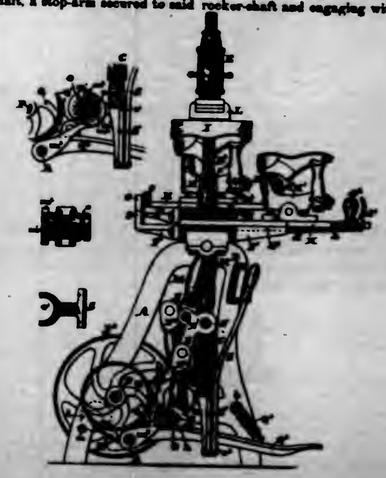
Claim.—1. In combination, a supporting-column having a fixed and movable part, the fixed part forming or carrying the heel portion, and a fore-part last detachably connected to the movable part of the standard, the movable part having separating movement in relation to the fixed part, whereby the fore-part last is forced into the shoe by this movement and retained therein when the shoe is lifted from the column, substantially as described.

2. In combination, a supporting-column having a fixed and a movable part, the fixed part forming or carrying the heel portion and having a slot in its end, a fore-part last having a tang and head adapted to engage with the slot in the fixed portion, the said last being supported by the movable part, said movable part of the column having separating movement in relation to the fixed part, whereby the fore-part last may be forced into the shoe and retained therein when the shoe is lifted from the column, substantially as described.

3. In combination, the column having fixed and movable parts, one forming the heel and the other carrying a vertically-detachable fore-part last, a wedge arranged to separate the parts of the column, a rod connecting the wedge and treadle, and a retracting-spring, substantially as described.

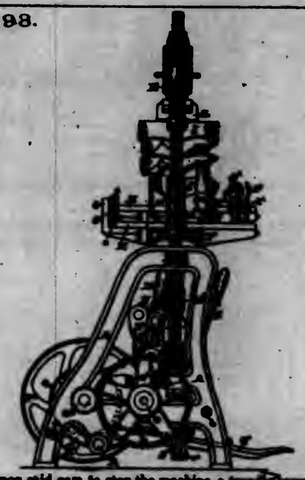
884,892. PAPER AND LETTER FILE. WARD COOPER, La Porte City, Iowa. Filed Jan. 26, 1888. Serial No. 261,865. (No model.)

Claim.—The improved letter and paper file herein described and shown, comprising a horizontal base, a vertical shank secured rigidly thereto near one end, and the retaining-frame consisting of a wire bent to form a vertical arm journaled to the opposite end of the base, then bent outward from the base, then horizontally toward the hook, and then vertically downward, and having a socket in its end to engage the point of the hook, as set forth.



884,893. BEATING-OUT MACHINE. JAMES C. OTTERSEN, Lynn, Mass., assignor to Ottersen & Johnson, same place. Filed Oct. 26, 1887. Serial No. 253,022. (No model.)

Claim.—1. A machine for beating out the soles of boots and shoes, provided with two jacks, two molds, and means, substantially as described, having provision for automatically moving one jack in one direction while the other is being moved in the opposite direction, whereby the sole of the shoe upon one jack will be under pressure while the other jack will be in a convenient position for the removal of the shoe therefrom.

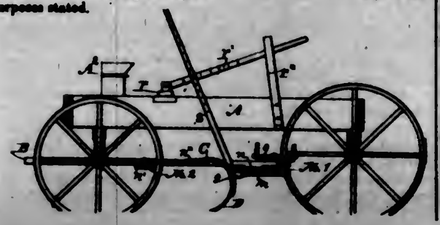


2. In a machine for beating out the soles of boots and shoes, the combination of a mold or die, a vertically-movable table, a shoe-supporting jack mounted upon said table, a pair of toggle-links for moving said table and jack toward and from said mold, an arm projecting laterally from one of said links and integral therewith, a crank, and a connecting-rod connecting said crank with said lateral arm.

3. In a machine for beating out the soles of boots and shoes, the combination of a mold or die, a shoe-supporting jack arranged to be moved vertically, a pair of toggle-links for moving said jack toward and from the mold, an arm projecting laterally from one of said links and integral therewith, a crank, and a rod connecting said crank with said lateral arm.

4. In a machine for beating out the soles of boots and shoes, the combination of a mold or die, a vertically-movable jack, a crank, a toggle mechanism connecting said crank and jack and having provision for the movement of the latter, a crank-shaft, a cam secured to said crank-shaft and provided with an abrupt shoulder, a driving-shaft, gearing for connecting said crank-shaft and said driving-shaft, a rocker-shaft, a stop-arm secured to said rocker-shaft and engaging with the

884,893.



shoulder upon said cam to stop the machine, a treadle secured to said rocker-shaft, a spring connecting said treadle with a stationary part of the machine, a brake-shoe operated by said treadle and acting upon said brake-wheel, and a suitable clutch mechanism for applying power to the driving-shaft when the shoe has been released from contact with the brake-wheel and the stop-arm has been disengaged from the shoulder of said cam.

5. In a machine for beating out the soles of boots and shoes, the combination of a mold or die, a vertically-movable jack, a crank, a toggle mechanism connecting said crank and jack pad having provision for the movement of the latter, a crank-shaft, a driving-shaft, gearing for connecting said crank-shaft and driving-shaft, a rocker-shaft, a stop-arm secured to said rocker-shaft, a cam mounted upon said crank-shaft so as to be moved lengthwise of said shaft and provided with an abrupt shoulder to engage with said stop-arm to stop the machine, a shifter-lever for moving said cam out of or into the plane of motion of said stop-arm, a treadle secured to said rocker-shaft, a spring connecting said treadle with a stationary part of the machine, a brake-shoe operated by said treadle and acting upon said brake-wheel, and a suitable clutch mechanism for applying power to the driving-shaft when the shoe has been released from contact with the brake-wheel and the stop-arm has been disengaged from the shoulder of said cam.

6. In a machine for beating out the soles of boots and shoes, the combination of a mold or die, a vertically-movable jack, a crank, a toggle mechanism connecting said crank and jack and having provision for the movement of the latter, a crank-shaft, a driving-shaft, gearing for connecting said crank-shaft and driving-shaft, a rocker-shaft, a stop-arm secured to said rocker-shaft, a cam secured to said crank-shaft and provided with an abrupt shoulder to engage with said stop-arm to stop the machine, a treadle secured to said rocker-shaft, a spring connecting said treadle with a stationary part of the machine, a forked lever secured to the outer end of said rocker-shaft, a beveled roll mounted in the end of said lever, a friction-wheel secured to the driving-shaft, and a loose driving-pulley mounted upon said driving-shaft and arranged to be pressed into contact with said friction-wheel by the action of said beveled roll upon its hub when it is desired to apply power to said driving-shaft.

884,894. ROAD-GRADING MACHINE. JOSEPH B. DAWSON, Knoxville, assignor of one-half to Henry C. Longsdorfer, Linn, Iowa. Filed Sept. 28, 1887. Serial No. 250,254. (No model.)

Claim.—1. In a road-scraper, the combination of a jointed beam, a scraper, and a carriage, to operate in the manner set forth, for the purposes stated.

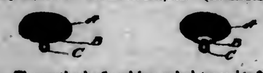
884,894.

2. The jointed beam C, the scraper D, having a fixed block, *g*, the chain-wheel No. 1, block *m*, hand-wheel *o*, and chain *n*, arranged and combined substantially as and for the purposes stated.

3. The jointed beam C, having a fixed block, *m*, the scraper D, having a semicircular block, *g*, and fixed draft-bars *n''*, the chain-wheels Nos. 1 and 2, and chains *n* and *n'*, arranged and combined to operate in the manner set forth, for the purposes stated.

4. The jointed beam C, having an elongated slot in its front portion, and the scraper D, pivoted to the rear portion of the said beam, in combination with a tractable carriage and mechanism for adjusting and elevating the scraper and beam, in the manner set forth, for the purposes stated.

5. The pivoted bar *r*, having hinged handles *r'*, the fixed racks *r''*, and the bars *e*, in combination with the scraper D, pivoted to the jointed beam C, to operate in the manner set forth, for the purposes stated.

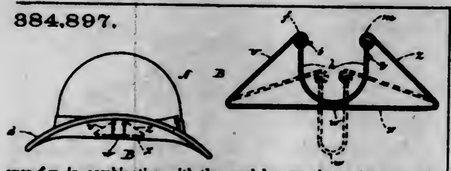


6. The improved road-scraping machine comprising a four-wheeled carriage, a jointed beam having a scraper pivoted to its under side and rear portion; mechanism for adjusting the scraper horizontally relative to the beam, and mechanism for adjusting the scraper vertically relative to the surface of the ground, arranged and combined to operate in the manner set forth.

884,895. LIMEKILN. JAMES W. DAVLIN, Flemington, Pa., assignor of seven-eighths to Austin H. Doyle, same place. Filed Oct. 14, 1887. Serial No. 252,327. (No model.)

Claim.—A limekiln comprising a stone base formed with a lower cooling-chamber, one side of which is gradually curved toward a lower exit-opening, and the opposite wall straight and having radially-arranged burning-chambers in the upper part thereof, and gas-ports over said burning-chambers, a cupola consisting of an inner fire-brick wall built into the upper part of the stone base, the inner opening of which aligns with and forms an upward continuation of the lower cooling-chamber, an outer metallic shell surrounding the inner fire-brick wall to form a compartment therewith, and having a shoulder formed therein to increase the extent of said space between the inner fire-brick wall and outer shell adjacent to the greatest point of heat radiation, and a packing of ashes between said inner fire-brick wall and outer metallic shell, and of increased thickness adjacent to the stone base, substantially as described.

884,896. MANUFACTURE OF UPHOLSTERY-TUFTS. GEORGE DOOLITTLE, Bridgeport, Conn., assignor, by mesne assignments, to S. H. Hubbard, same place, and John E. Beach, New Haven, Conn., trustees. Filed May 12, 1888. Serial No. 274,088. (No model.)



Claim.—The method of making upholsterers' tufts, which consists in inserting a mass of unsewed yarn or other fiber under temporary compression within a cup-shaped metal back and then crimping the sides of said back firmly against said yarn or fiber, substantially as set forth.

884,897. HAT-HANGER. STEPHEN I. DEACH, Swampscott, Mass. Filed Apr. 16, 1888. Serial No. 270,737. (No model.)

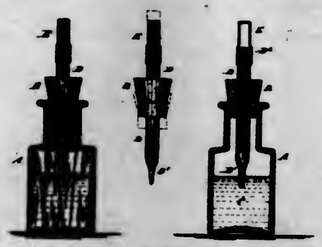
Claim.—1. In a device of the character described, the curved body *x*, provided with the elastic arms *v v*, having the eyes *f m*, in combination with the hat A, provided with the sweat-band *k* and with the elastic cord A, secured in said eyes and passing through holes in said band or the brim *d*, substantially as specified.

2. The improved hat-hanger consisting of the inwardly-curved body *x*, provided with the inwardly-bent elastic arms *v v*, having the

384,897.

eyes *f m*, in combination with the cord *A*, secured to said arms, substantially as set forth.

384,898. STEAM-GENERATOR. JAMES A. ROE, Newark, N. J., assignor to the Roe Steam Generator Company, same place. Filed Feb. 7, 1888. Serial No. 263,871. (No model.)



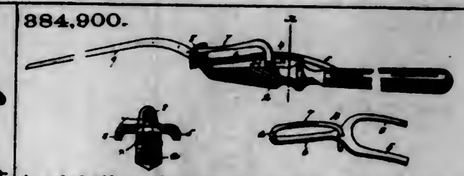
Claim.—1. In a steam-generator, the combination, with a boiler, *a*, circulating-pipes *f f'*, a series of generating-pipes, *c*, a branch pipe, *h*, and vertical connecting-pipes, of a mud-drum having the inlet-pipe thereof disposed beneath the said branch, substantially as set forth.

2. In a steam-generator, the combination, with the boiler and a series or collection of circulating-pipes disposed horizontally beneath the boiler and having a vertical course or turn, as at h^2 h^4 h^3, in their length, and a mud-drum or sediment-receptacle, *i*, disposed beneath the said vertical course or turn in said circulating-pipes, substantially as and for the purposes set forth.

3. In combination, a steam-generator with a series of generating-pipes, *c*, a branch, *h*, and a mud-drum directly connected with said branch and receiving the sediment therefrom, substantially as and for the purposes set forth.

4. The combination, in a steam-generator, with a series of pipes, *c*, a mud-drum, *i*, and circulating-pipes *f f'*, of a branch, *h*, having upwardly-turned extremities h^3 and intermediate pipes, h^4, and a downwardly-extending pipe, h^2, all formed integral with said branch and providing means for coupling with the said pipes, and a mud-drum, substantially as and for the purposes set forth.

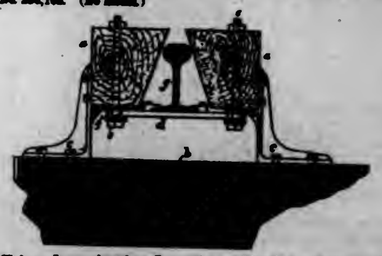
384,899. INK-SUPPLYING DEVICE. HERMANN RÖSER, Hoboken, N. J. Filed Nov. 11, 1887. Serial No. 254,857. (No model.)



Claim.—1. The ink-supplying device herein described, the same comprising the tube D, and a cylindrical rubber cap, E, fitting upon its upper end and arranged, as shown, so that it may be slid thereon to vary its capacity, as and for the purpose specified.

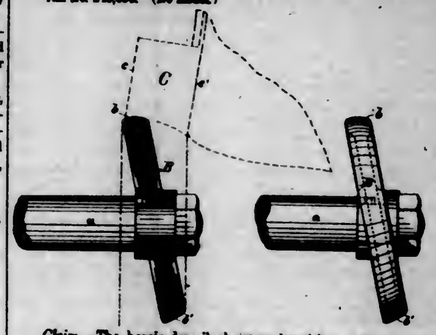
2. The ink-supplying device herein described, the same comprising a tube, D, contracted and flattened at its lower end, a cylindrical rubber cap, E, fitting adjustably upon its upper end, and a cork, B, fitting adjustably upon its body between the ends, all combined and arranged for joint operation as and for the purpose specified.

384,900. FORK-GUARD. FREDERICK C. FISHER, Northampton, Mass., assignor to the Northampton Cutlery Company, same place. Filed Apr. 4, 1888. Serial No. 269,694. (No model.)



Claim.—A fork-guard having an elastic extension, 7, of its arm 6, the end of which extension passes through the guard, combined with a fork-shank having cheek-pieces thereon to and between which

384,900.



the end of said extension is pivotally connected, substantially as set forth.

384,901. GUARD-RAIL AND INSULATOR FOR ELECTRIC RAILWAYS. EGIDIO A. FRETTO, Boston, Mass. Filed Apr. 26, 1887. Serial No. 236,162. (No model.)

Claim.—In an electric railway, the combination, with trapezoidal guard-rails supported above railway-ties, of an insulated electric conducting-rail suspended between said guard-rails and said ties, substantially as and for the purpose described.

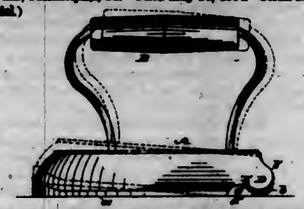
384,902. BURNISHING OR TRIMMING TOOL. ALFRED B. FOULKE and GEORGE R. WARREN, Exeter, N. H., assignors to the Rockingham Machine Company, of New Hampshire. Filed Sept. 14, 1887. Serial No. 249,694. (No model.)

Claim.—The herein-described rotary burnisher or trimmer-tool B, arranged obliquely and eccentrically upon the rotary shaft *a*, as and for the purpose set forth.

384,903. COUNTER-ILLUMINATING ROOM. RUSSELL FRASER, Austin, Ill. Filed Mar. 5, 1888. Serial No. 266,127. (No model.)

Claim.—1. The combination, with the shelving B, having vertical recesses C, of a sliding frame consisting of side pieces, D, movably supported in the upper part of said recesses and connected by end pieces, E, and the curtains H, supported by said frame, whereby, when said frame and curtains are drawn out in front of the shelving, a darkened room will be formed for the display of goods by artificial light, substantially as described.

2. The combination of the shelving B, having vertical recesses C, the sliding side pieces, D, movably supported in the upper part of said recesses and connected by end pieces, E, the side curtains, H, supported by the side pieces, D, the mirror K, supported on the inner side of the front end piece E, the mirror M, supported by the shelving, and a lamp, *g*, whereby an artificially-illuminated room may be formed in front of the shelving when the curtains H and their supports are drawn out, substantially as described.



3. The combination, with the counter A and the shelving B, having vertical recesses C, of a sliding frame composed of side pieces, D, movably supported in the upper part of said recesses, the connecting end pieces, E, and the front corner posts, F, arranged to rest on the counter when the said frame is drawn out in front of the shelving, the

384,903.

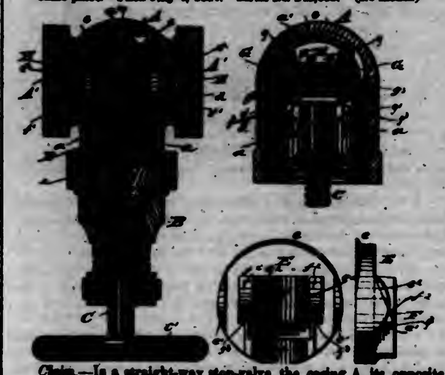
side curtains, H, supported by the sliding frame, and the mirrors K M, and lamp *g*, located in the space inclosed by said frame and curtains, substantially as described.

384,904. CORRUGATED SMOOTHING AND POLISHING IRON. WILLIAM D. GALE, Philadelphia, Pa. Filed May 26, 1884. Serial No. 133,033. (No model.)

Claim.—1. A combined smoothing and polishing iron having the base or ironing portion thereof a plane surface, and provided with the heel D and the channel C, the latter being between said heel and base, the said heel being above the level of the base and convex or rounded both longitudinally and transversely, all substantially as and for the purpose set forth.

2. A combined smoothing and polishing iron consisting of a base or ironing portion forming a plane surface, and a polishing-heel separated from the ironing portion by a channel, the said heel being convex both longitudinally and transversely, the iron being so weighted as to normally rest on its ironing-surface, the polishing-heel being above the same, substantially as and for the purpose set forth.

384,905. KILN FOR BURNING HYDRAULIC CEMENT. CHARLES R. GOODLIN, Whitehall, assignor of one-half to Saml. R. Wellington, Catasauqua, Pa. Filed Nov. 2, 1887. Serial No. 254,663. (No model.)



Claim.—1. An apparatus for drying and burning hydraulic cement, consisting of a vertical kiln opening at the top into a horizontal

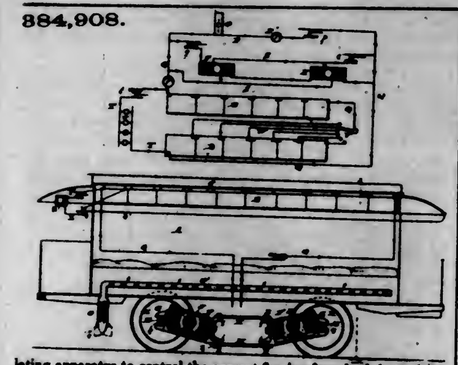
chamber, in which the slip is dried preparatory to burning, and through which all the products of combustion from the kiln pass on their way to the smoke-stack, as set forth.

2. In kilns for burning cement, a vertical kiln in which the cement is burned; a horizontal tunnel or tunnels communicating with the upper portion of the vertical kiln, said tunnels being divided into compartments, around which the waste products of combustion from the burning-kiln are caused to pass on their way to the stack, as set forth.

384,906. STRAIGHT-WAY STOP-VALVE. HENRY HALL, Lexington, N. Y., assignor to the Rensselaer Manufacturing Company, same place. Filed July 7, 1887. Serial No. 243,603. (No model.)

Claim.—In a straight-way stop-valve, the casing A, its opposite ports, and stop-lug *c'* between said ports, and the valve-stem casing B, valve-stem, and angularly-flanged nut playing on said stem, in combination with the oppositely-facing gates E, hung upon the angular flange of said nut, having pairs of oppositely-facing inclines f^3 on their inner faces, flanges e^2 to the inside of said inclines, flanges *d* to the outside thereof, and shoulders f^4, the independent recessed arms G G, hung between gates E E on the shoulders f^3 thereof, and lying between the flanges *d* and inclines f^3, and the wedges H H, placed in the recesses of said arms and engaging the inclines f^3 of the opposite gates, all substantially as and for the purpose described.

384,907. RELIEF-VALVE FOR DOOR-CHECKS. HENRY A. HOUSE and HENRY A. HOUSE, Jr., Bridgeport, Conn. Filed Dec. 31, 1887. Serial No. 259,469. (No model.)



Claim.—1. The combination, with the compressing-piston and the central spindle having ports above and below said piston, and a vertical channel connecting said ports, of the stem suspended from a vertically-adjustable cap, said stem having on its lower extremity a valve-disk which extends immediately over and in close proximity to said vertical channel, and the coil-spring around said stem at the upper end thereof and confined between the cap and a shoulder on the stem, substantially as shown, and for the purposes set forth.

2. The combination of the piston D, the spindle B, having at its lower end ports *a b*, connected by channel 18, having widened conical mouth *c*, said spindle being threaded exteriorly at the upper extremity, the interiorly-threaded cap H, adapted to the threaded end of the spindle, the valve-stem F, extending through said spindle and attached to said cap, and having near the upper end a shoulder, J, and on the lower extremity a valve-disk, G, extending immediately over the channel 18 and within the widened conical mouth *c*, and the coil-spring K around the stem between the shoulder J and the top of the cap, substantially as and for the purposes herein shown and set forth.

384,908. ELECTRIC RAILWAY. RUDOLPH M. HUNTER, Philadelphia, Pa. Filed June 10, 1887. Serial No. 240,860. (No model.)

Claim.—1. The combination of a vehicle-body supported on springs and having two compartments located one on each side of the vehicle-body in the plane of the wheels, running-gear thereof, an electric motor supported thereon and connecting with the axles, an electric circuit connecting both batteries with the electric motor, and a single regu-

384,908.

lating apparatus to control the current flowing from both batteries to the motor.

2. The combination of a vehicle-body supported on springs and having two compartments located one on each side of the vehicle-body in the plane of the wheels, running-gear therefor, an electric motor supported thereon and connecting with the axles, an electric circuit connecting both batteries with the electric motor, a single regulating apparatus to control the current flowing from both batteries to the motor, and a cut-out device to cut out or in one or more cells of the batteries.

3. The combination of an electrically-propelled vehicle, two sets of batteries on said vehicle, the cells of one of said batteries being coupled in series with the cells of the other battery, a switch device to cut in or out one or more of the cells of one of the batteries, an electric motor, and a circuit connecting the motor in series with the two batteries.

4. The combination of an electrically-propelled vehicle, two sets of batteries on said vehicle, the cells of one of said batteries being coupled in series with the cells of the other battery, a switch device to cut in or out one or more of the cells of one of the batteries, an indicator to indicate the current strength of the batteries to direct the movement of the switch, an electric motor, and a circuit connecting the motor in series with the two batteries.

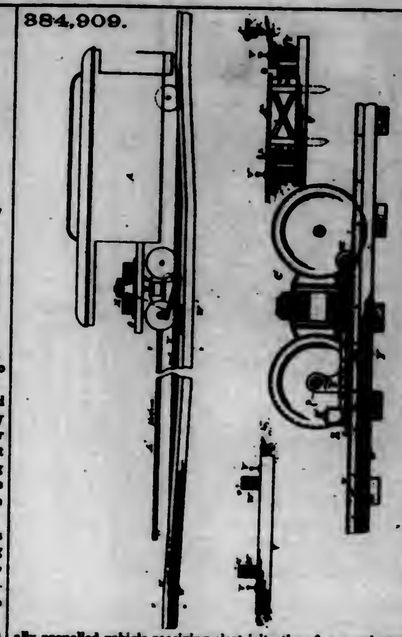
384,909. ELECTRIC RAILWAY. RUDOLPH M. HUNTER, Philadelphia, Pa., assignor to the Electric Car Company of America, same place. Original application filed Oct. 19, 1886, Serial No. 216,962. Divided and this application filed Aug. 27, 1887. Serial No. 248,051. (No model.)

Claim.—1. In an electric railway, the combination, with the rail-track, of an exposed working-conductor and a shield or guard to protect said working-conductor at portions of its length corresponding to stations or crossings, but allow access thereto by the collector on the vehicle.

2. In an electric railway, the combination, with the rail-track, of an exposed working-conductor and a shield or guard to protect said working-conductor at portions of its length corresponding to stations or crossings, said guard consisting of extended side walls projecting above the working-conductor.

3. In an electric railway, the combination, with the rail-tracks, of an exposed working-conductor having its surface depressed at portions of its length corresponding to stations or crossings to take it out of dangerous exposure at such places, and an open passage-way leading to the conductor at its depressed portions.

4. In an electric railway, the combination, with the rail-tracks, of an exposed working-conductor having its surface depressed at portions of its length corresponding to stations or crossings to place it out of dangerous exposure at such places, and projecting guards or shields extending above said conductor at its depressed portions.



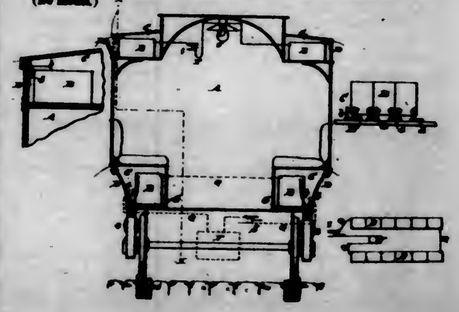
5. In an electric railway, the combination, with the rail-tracks, of an exposed working-conductor having its surface depressed at portions of its length corresponding to stations or crossings to place it out of dangerous exposure at such places, an electrically-propelled vehicle, and vertically-movable current-collectors adapted to follow the surface of the working-conductors.

6. In an electric railway, a bared working-conductor, an electrically-propelled vehicle receiving electricity therefrom, and a soft moisture-absorbing wiper carried by said vehicle and adapted to wipe said working-conductor.

7. In an electric railway, a bared working-conductor, an electrically-propelled vehicle receiving electricity therefrom, a moisture-wiper carried by said vehicle, adapted to wipe said working-conductor, and current-collectors arranged in the rear of said wiper.

8. In an electric railway, a bared working-conductor, an electrically-propelled vehicle receiving electricity therefrom, a pivoted truck supporting said vehicle, and a moisture-wiper carried by said truck and adapted to wipe said working-conductor.

384,909.



9. In an electric railway, a bared working-conductor, an electrically-propelled vehicle receiving electricity therefrom, a moisture-wiper carried by said vehicle, adapted to wipe said working-conductor, current-collectors arranged in the rear of said wiper, and a removable moisture-absorbing sponge, pad, or equivalent device carried by the wiper, whereby said sponge or pad may be removed from time to time to press out the water collected.

10. In an electric railway, the railway-track, combined with a station platform or crossing, an exposed working-conductor parallel to the track, extending to or near each end of the platform or crossing, a section of the working-conductor connecting the two parts of the exposed working-conductor, and a slotted conduit or casing inclosing the connecting-section of the working-conductor.

11. In a railway, the combination, with the rails of the track and a vehicle, of an exposed working-conductor having its exposed surface turned out of line at portions of its length corresponding to stations or crossings to take it out of dangerous exposure at such places, and a current-collector carried by the vehicle and making contact with the conductor.

12. In an electric railway, the combination of a working-conductor, a traveling vehicle, and a moisture-wiper carried thereby on a transverse axis and adapted to wipe the working-conductor.

384,910. ELECTRIC RAILWAY. RUDOLPH M. HUNTER, Philadelphia, Pa. Original application filed June 10, 1887, Serial No. 240,959. Divided and this application filed Apr. 26, 1888. Serial No. 271,893. (No model.)

Claim.—1. The combination of a vehicle having a compartment on its roof and an electric battery located therein.

2. The combination of a vehicle having a compartment on each side of its roof and an electric battery located in each compartment.

3. The combination of a vehicle having a compartment on its roof, an electric battery located therein, and a door to open or close said compartment.

4. The combination of a vehicle having a compartment, a removable battery consisting of separate cells located therein, a door or cover to close said compartment, and circuit-closing devices controlled by the door or cover to couple up the cells of the battery when the door or cover is closed.

5. The combination of a vehicle having a compartment, a removable battery consisting of cells located therein and having contact projections, a hinged door or cover to close said compartment, and circuit-closing spring devices controlled by the door or cover to touch said contact projections and couple up the cells of the battery when the door or cover is closed.

6. The combination of a car or vehicle, a battery arranged upon its roof or upper part, an electric motor arranged upon its lower part, and connecting-circuits between said battery and motor.

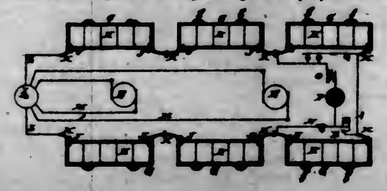
7. The combination of a compartment supported on axles by means of springs, a removable door or cover to said compartment, removable secondary battery-cells in said compartment, a circuit-closing device carried by the door or cover to couple up the battery into working connection, an electric motor to propel the compartment, and conductors connecting the battery and motor.

8. The combination of a traveling vehicle having battery-compartments arranged upon each side of the vehicle and over the wheels, and secondary batteries located within said compartments, whereby the weight thereof shall be located in the plane of the wheels, avoiding excessive strains to the car or vehicle frame.

9. The combination of a traveling vehicle having battery-compartments arranged upon each side of the vehicle and over the wheels, a passage-way located longitudinally through the vehicle and having its floor below the top of the batteries and between the battery-compartments, and secondary batteries located within said compartments, whereby the weight thereof shall be located in the plane of the wheels, avoiding excessive strains to the vehicle-frame.

10. The combination of a traveling vehicle having battery-compartments arranged upon each side of the vehicle and over the wheels, and secondary batteries located within said compartments, whereby the weight thereof shall be located in the plane of the wheels, avoiding excessive strains to the vehicle-frame, an electric motor to propel the vehicle, a mechanical connection between the motor and axle, and an electric circuit connecting the motor and both batteries.

11. The combination of an electrically-propelled vehicle, an electric motor to propel said vehicle, a secondary battery composed of a series of cells connected in series to supply current to said motor, a signal-circuit including one cell of the battery, a resistance and an electric bell in said circuit, and a circuit-maker to make or break said signal-circuit.



12. The combination of a compartment supported on axles by means of springs, a movable door or cover to said compartment, a series of removable battery-cells on said compartment, an electric motor directly connected to the axles and supported thereon, and conductors connecting the battery and motor.

13. The combination of a car, an electric motor to propel it, a battery on said car, consisting of a large number of cells connected in series with the motor, an electric signal on the car, a circuit including the said electric signal and a small part of the battery employed for the motor, and a switch to control the current flowing over said signal-circuit.

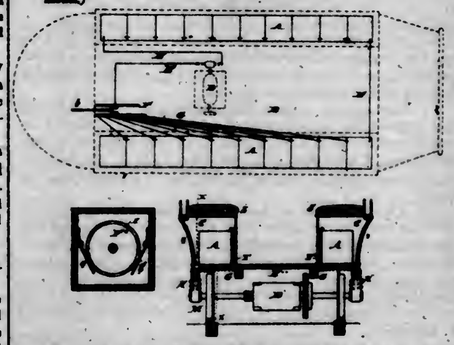
384,911. ELECTRIC RAILWAY. RUDOLPH M. HUNTER, Philadelphia, Pa. Filed Apr. 26, 1888. Serial No. 272,152. (No model.)

Claim.—1. In an electric railway, an electrically-propelled vehicle provided with a compartment under the side seats and windows, and a door extending along the outside of the car, forming the wall of the car-body, in combination with cells of a secondary battery arranged within said compartment independent of said wall-door and capable of removal through said doorway.

2. A car having seats arranged longitudinally upon the car, in

384,911.

combination with compartments under said seats and battery-cells arranged within said compartments.



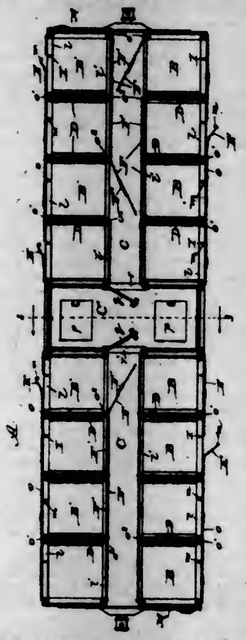
3. The combination of a car-body having seats and compartment under said seats opening to the outside of the car, a removable battery arranged within said compartment, whereby the gases may pass from the battery out into the atmosphere, a loosely-fitting door or cover for said compartment independent of the battery, means to secure it in place on the car so that it forms part of the wall of the car-body, a circuit permanently on the car-body, a translating device in said circuit, and a coupling device or devices permanently located in the compartment for connecting up the battery with the circuit on the car.

4. The combination of a car-body having seats and a battery-compartment under said seats, and in which the car-wall is formed with two or more separate openings to said compartment, separate doors or covers for said openings to said compartment, and separate batteries in the compartment in line with each door, and connecting-circuits for said batteries, whereby any bending or warping of the car-body will not interfere with the doors or batteries.

5. The combination of a car-body having seats and a battery-compartment under said seats, and in which the car-wall is formed with two or more separate openings to said compartment, and to one side of the support of the car-body on the axles, separate doors or covers for said openings to said compartments, and separate batteries in the compartment in line with each door, and connecting-circuits for said batteries, whereby any bending or warping of the car-body will not interfere with the doors or batteries.

6. The combination of a car-body having seats and a battery-compartment under said seats, and in which the car-wall is formed with two or more separate openings to said compartment, separate doors or covers for said openings to said compartment, and separate removable slides or trays supporting batteries in the compartment in line with each door, and connecting-circuits for said batteries, whereby any bending or warping of the car-body will not interfere with the doors or batteries.

384,912. ELECTRIC RAILWAY. RUDOLPH M. HUNTER, Philadelphia, Pa. Original application filed Jan. 20, 1888, Serial No. 261,662. Divided and this application filed May 4, 1888. Serial No. 273,207. (No model.)



Claim.—1. The combination of a car-body having compartments under its seats for batteries, a series of batteries arranged upon the car above the floor-level, a regulator to modify the coupling up of said batteries, arranged within reach of the operator upon the front platform, an electric motor to propel the car, and a series of circuits leading from the batteries to the regulator, arranged below and close to the floor of the car-body.

2. The combination of a car-body having compartments for electric batteries, a series of removable batteries, a motor to propel the car, electric circuits fixed below and close to the car-body for coupling up the motor with the batteries, a regulator arranged in said circuit, and detachable connections between the circuits and batteries.

3. The combination of a car-body of an electric car supported upon the truck by springs, with freedom of vertical movement, a series

of removable batteries on the car-body, an electric motor under the car-body and connected with the axle of the car, a regulator for the motor on the front platform of the car, and with freedom of vertical movement with respect to the motor, and a looped circuit or circuits fixed to the car, extending from the batteries forward to the regulator, and then back to the motor, with capability of allowing the car-body, batteries, and regulator to rise and fall without breaking the electrical connection with the motor.

884,918. POULTRY-CAR. WILLIAM P. JENKINS, Chicago, Ill., assignor to the Jenkins Live Poultry Car Company, same place. Filed Apr. 17, 1888. Serial No. 270,880. (No model.)

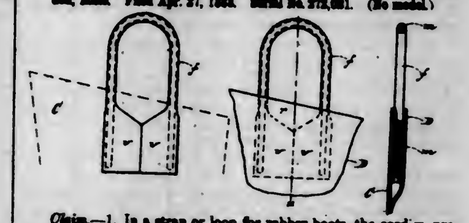
Claim.—1. A live-poultry car comprising, in combination, a car divided internally into tiers of compartments opening laterally of the car, and a longitudinal aisle within the car separating the tiers of compartments into two sets normally closed to and controllably accessible from the aisle, substantially as described.

2. A live-poultry car comprising, in combination, a car, A, divided internally into tiers of compartments opening laterally of the car and provided with doors E, a longitudinal aisle, C, within the car, separating the tiers of compartments into two sets, B and B', and doors for the said compartments, opening into the aisle C, substantially as described.

3. A live-poultry car comprising, in combination, a car, A, divided internally into tiers of compartments having their sides formed with open-work, substantially as described, and opening laterally of the car, doors E for the compartments in the open-work at opposite sides of the car, a longitudinal aisle, C, within the car, separating the tiers of compartments into two sets, B and B', an open-work door, F, for each tier, opening into the aisle C, and doors F' in the doors F, substantially as described.

4. A live-poultry car comprising, in combination, a car, A, divided internally into tiers of compartments opening laterally of the car and provided with doors E, a longitudinal aisle, C, within the car, separating the tiers of compartments into two sets, B and B', doors F for the said compartments, opening into the aisle C, and troughs H, supported in the compartments and removable from and adjustable into the said compartments from the aisle through the doors F when closed, substantially as described.

5. A live-poultry car comprising, in combination, a car, A, divided internally into tiers of compartments opening laterally of the car, a longitudinal aisle, C, within the car, separating the tiers of compartments into two sets, B and B', normally closed to and controllably accessible from the aisle, troughs H in the compartments, and a stationary water-supply tank, L, provided with means for leading water from it to the compartments, substantially as described.



6. A live-poultry car comprising, in combination, a car, A, divided internally into tiers of compartments opening laterally of the car, a longitudinal aisle, C, within the car, separating the tiers of compartments into two sets, B and B', normally closed to and controllably accessible from the aisle, troughs H in the compartments, a transverse aisle, C', crossing the aisle C, and a stationary water-supply tank, L, above the aisle C', and provided with means for leading water from it to the compartments, substantially as described.

7. A live-poultry car comprising, in combination, a car, A, divided internally into tiers of compartments opening laterally of the car and provided with doors E, having staples *m*, a longitudinal aisle, C, within the car, separating the compartments into two sets, B and B', doors for the said compartments, opening into the aisle C, a vertically-reciprocating rod, I, for each tier, having hooks *m'*, to engage with the staples *m*, and a crank-rod, K, for each rod I connected therewith and extending into the aisle C, substantially as described.

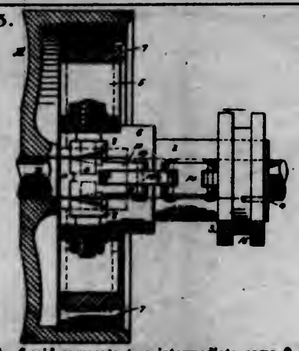
8. A live-poultry car comprising, in combination, a car, A, divided internally into tiers of compartments having hinged drop-decks G and opening laterally of the car, and a longitudinal aisle, C, within the car, separating the tiers of compartments into two sets, B and B', normally closed to and controllably accessible from the aisle, substantially as described.

9. A live-poultry car comprising, in combination, a car, A, divided internally into tiers of compartments having hinged drop-decks G and hinged supports *k* for the free ends of the drop-decks and opening laterally of the car, and a longitudinal aisle, C, within the car, separating the tiers of compartments into two sets, B and B', normally closed to and controllably accessible from the aisle, substantially as described.

884,914. STRAP FOR RUBBER BOOTS. FRANK A. JOSEPH, Malden, Mass. Filed Apr. 27, 1888. Serial No. 272,681. (No model.)

Claim.—1. In a strap or loop for rubber boots, the cord *m*, provided with a cover of rubber or rubber cloth having the inwardly-projecting attaching-flanges *v*, substantially as shown and described.

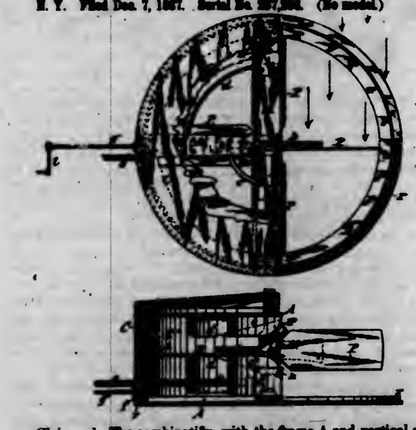
2. A strap or loop for rubber boots, comprising the cord *m*, provided with a cover of rubber or rubber cloth having the inwardly-projecting attaching-flanges *v*, in combination with the boot-leg D, said strap being vulcanized onto the leg, substantially as described.



884,915. FRICTION-CLUTCH PULLEY. ARMIDE P. EMELIN, Holyoke, Mass. Filed Mar. 7, 1888. Serial No. 266,468. (No model.)

Claim.—1. A friction-clutch consisting of a cylindrical sleeve having laterally-extending arms 5, two friction-segments engaging with said arms and capable of lateral movements thereon, two cams, 8, oppositely secured to each of said segments, two intermediate cams, 9, engaging with said cams 8, each having a laterally-extending arm, a collar, 3, capable of a longitudinal motion on said sleeve, and links 14, pivotally connected between said collar and the arms on said cams 9, a driving-pulley, A, inclosing said segments, and retracting-springs between the latter, substantially as set forth.

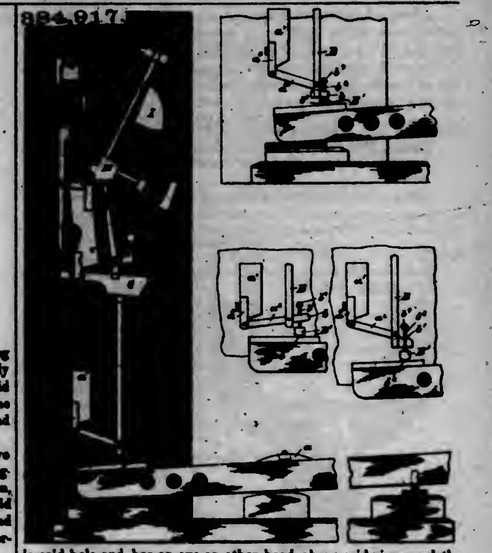
2. A friction-clutch consisting of a cylindrical sleeve having laterally-extending arms 5, two friction-segments engaging with said arms and capable of lateral movements thereon, two cams, 8, oppositely secured to each of said segments, two intermediate cams, 9, engaging with said cams 8, each having a laterally-extending arm adjustably connected thereto, a collar, 3, capable of a longitudinal motion on said sleeve, and links 14, pivotally connected between said collar and the arms on said cams 9, a driving-pulley, A, inclosing said segments, and retracting-springs between the latter, substantially as set forth.



884,915.

3. The driving-pulley A, the friction-segments 7, each having two oppositely-secured cams, 8, thereon, two intermediate cams, 9, engaging with said cams 8, said cams 9 each having a groove, *a*, therein, combined with the sleeve 2, having studs thereon engaging in said grooves, a collar, 3, having a longitudinal movement on said sleeve, and link-and-arm connections, as described, between said collar and intermediate cams, substantially as set forth.

884,916. CURRENT WATER-WHEEL. JOHN H. KINNEY, Buffalo, N. Y. Filed Dec. 7, 1887. Serial No. 257,202. (No model.)



Claim.—1. The combination, with the frame A and vertical shaft *a*, of the arms *b b*, arranged horizontally one above the other at right angles to each other, and extending diametrically through the vertical shaft and journaled therein, paddles P P, rigidly attached to opposite ends of each arm *b* and disposed in planes at right angles to each other, and cams *c* and *d*, projecting, respectively, from the top and bottom of the frame A and engaging the successive paddles alternately at the top and bottom edges to turn each succeeding paddle in opposite direction from the preceding paddle, substantially as set forth.

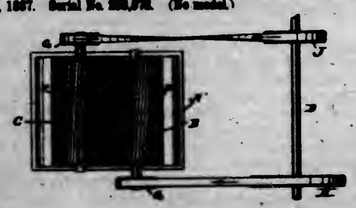
2. The combination of the frame A, the shaft *a*, pivoted vertically to said frame, the arms *b b*, pivoted horizontally to said vertical shaft, paddles P P, secured to said arms, cams *c d*, secured to the frame A and adapted to turn the paddles on their pivots on the shaft, a stationary semicircular casing inclosing the frame A and one half of the wheel, a semicircular casing pivoted to the vertical shaft *a* and adapted to inclose the other half of the wheel, the pinion *n*, secured to the shaft *a* inside of the casing, the driving-shaft *o*, extending into the casing, and the pinion *n'* on said driving-shaft meshing with the pinion *n*, all combined to operate substantially as described and shown.

884,917. ACTION FOR UPRIGHT PIANOS. PETER KEMMERER, Boston, Mass. Filed Nov. 22, 1887. Serial No. 255,662. (No model.)

Claim.—In an action for upright pianos, the extension having the lateral piece *h*, provided with a hole, *h'*, the screw *h²*, which screws in said hole and has an eye or other head above said piece, and the button E', secured to said screws below said piece *h*, as and for the purposes described.

884,917.

884,918. FLUE-THIMBLE. CHARLES C. LESLEY, Merrill, Wis. Filed July 14, 1887. Renewed May 24, 1888. Serial No. 274,948. (No model.)

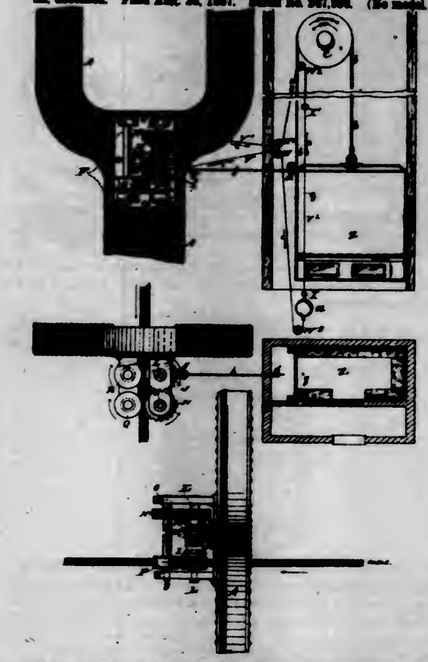


Claim.—1. The combination, with a flue-thimble having at its outer end an internal groove and a lateral slot, of a circular spring-wire arranged in said groove, with one part secured in a stationary position and one end having an arm extending through the lateral slot to the exterior of the thimble, and a device connected with said external arm for operating the spring-wire, substantially as described.

2. The combination, with a flue-thimble having at its outer end an internal circular groove, a lateral slot, and a lateral flange, of a circular spring-wire arranged in the groove, with one part secured in a stationary position, and one end extending through the slot and having a crank-arm, and a lever pivoted to said lateral flange and connected at one side of the pivot with the crank-arm, substantially as described.

3. The combination, with a flue-thimble having at one end the lateral slot 4, orifices 5 and 6, and lateral flange 11, of the circular spring-wire 7, having the leg 8 and leg 9, respectively, engaging said orifices and extending through the lateral slot, and having a crank-arm, 10, and a lever, 13, pivoted to said lateral flange and loosely connected with the crank-arm of the wire, substantially as described.

884,919. ROLLER-MILL. JONATHAN D. MAWSON, Richmond, Ind., assignor to the Richmond City Mill Works, same place. Filed Apr. 4, 1887. Serial No. 233,578. (No model.)



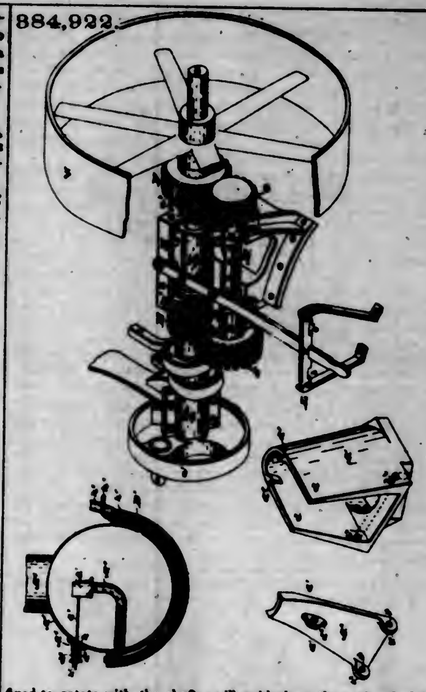
Claim.—A roller-mill comprising a pair of interchangeable transposable rolls having teeth facing reversely relatively upon the two rolls, the faces and backs of the teeth being at dissimilar angles, and a driving-shaft and pulleys arranged to transmit motion to said two rolls and to revolve one roll at a higher rate of speed than the other, substantially as and for the purpose set forth.

384,920. ANTI-FRICTION COMPOUND. THOMAS J. MAYALL, Reading, Mass.; Lucy A. Mayall, same place, executrix of said Thomas J. Mayall, deceased. Filed June 21, 1887. Serial No. 242,024. (Specimens.)

Claim.—The anti-friction compound herein described, consisting of rubber, sulphide of antimony, graphite, oxide of iron, and asbestos, in substantially the proportions hereinbefore set forth.

384,921. ELEVATED RAILWAY. THOMAS J. MAYALL, Reading, Mass.; Lucy A. Mayall, same place, executrix of said Thomas J. Mayall, deceased. Filed Aug. 26, 1887. Serial No. 247,926. (No model.)

Claim.—1. The combination, with the supporting-columns and traction-cable of an elevated railway, of an elevator-car, its hoisting-cable, and mechanism, as set forth, for communicating motion to said car in either direction from said traction-cable, substantially as described.



2. The combination, with the supports and traction-cable, of the grip-rollers carried by said supports, the elevator-car, its hoisting-cable, the shifting-drum upon which said cable is wound, and gearing connecting said grip-rollers with said drum for rotating the latter and raising or lowering said car, substantially as described.

3. In combination with a rail-support, A, the actuating mechanism F, embracing a shifting-drum, G, provided with a stop-motion, M M', and having terminal friction-cones H and I integrally connected therewith, a gear, J, to elevate the lift, and a clamp-wheel, K, to lower the same, the auxiliary wheels P Q R, gear N, and shafts L and O, constructed and adapted to receive motion from an elevated horizontal cable to operate an elevator-car, substantially as set forth.

384,922. PORTABLE ENGINE. JAMES MILLER and MARTIN J. HOGAN, Canton, Ohio; said Hogan assignor to said Miller. Filed Apr. 23, 1887. Serial No. 235,951. (No model.)

Claim.—1. In a portable steam-engine, the combination of the engine-shaft, means for rotating the same, gear-wheels of different diameters loosely mounted on the engine-shaft, a shaft counter to the engine-shaft, a pair of gear-wheels of different diameters fixed on said counter-shaft and meshing with the gear-wheels of the engine-shaft, clutches attached to the gear-wheels on the engine-shaft, clutch-sleeves secured on the engine-shaft to slide longitudinally on the shaft and

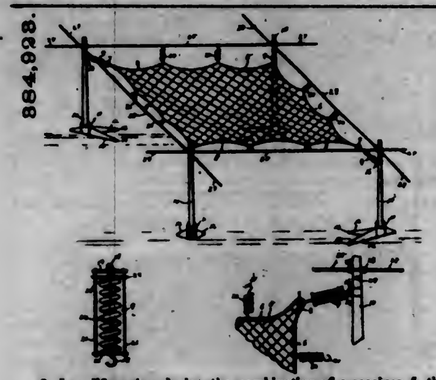
884,922.

fixed to rotate with the shaft, a pillow-block on the engine-shaft between the said clutch-sleeves, a yoke the branches of which loosely embrace the said clutch-sleeves, a shifting-lever pivoted to a support on the said counter-shaft and to the said yoke, a lever-retaining bracket secured in position to engage the handle of the lever, and detents in the bracket to lock the lever in the several adjustments for running the machine independent of the ground-wheels and for driving the ground-wheels at different speeds, substantially as set forth.

2. An exhaust-nozzle consisting, essentially, of a U-shaped body having converging sides, and a vibrating valve pivoted to said U-shaped body and having converging edges, thereby allowing said valve to freely operate within the U-shaped body, substantially as set forth.

3. In an exhaust-nozzle, the combination of a U-shaped body having converging sides, a valve pivoted to said U-shaped body and having converging edges, a spring-actuated rod loosely pivoted to said valve and extending through the smoke-box, and means whereby the tension of the spring can be regulated, substantially as set forth.

4. In an exhaust-nozzle, the combination of a U-shaped body having converging sides, a valve having converging edges and ears on its lower portion, whereby it is pivoted to said U-shaped body, stops located on the U-shaped body, whereby the inward movement of the valve is limited, a spring-actuated rod loosely connected to said valve, and a nut located on the outer end of said rod, for the purpose substantially as set forth.



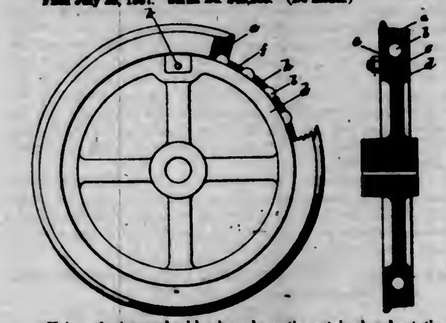
5. In a portable steam-engine, the combination, with the boiler and smoke-box, of a detachable feed-water heater attached to and adapted to conform to the outside of the smoke-box, an exhaust leading from the feed-water heater into the smoke-box, a steam-inlet pipe to the heater, and a water-pipe extending within the heater, substantially as set forth.

384,923. LIFE-SAVING DEVICE. EVERETT D. MOORE, Baltimore, Md., assignor to Thomas C. Chappell, same place. Filed Dec. 22, 1887. Serial No. 258,668. (No model.)

Claim.—1. In a life-saving device, the combination of a flexible landing-net provided at its outer edge with flexible vibrators, said vibrators being connected to handles suitable to be grasped by the hands of persons supporting the net, substantially as described.

2. In a life-saving device, the combination of a flexible landing-net provided at its outer edge with flexible vibrators, said vibrators being connected to lanyards which are provided with handles at their extremities suitable to be grasped by the hands of persons supporting the net, and stanchions to which said lanyards are secured between the handles and the vibrators, substantially as described.

884,923.



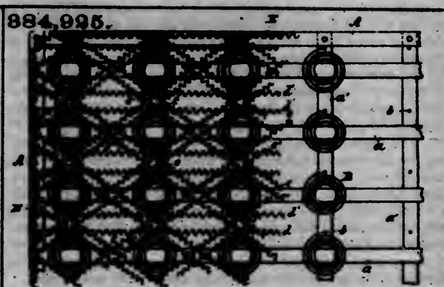
3. In a life-saving device, the combination of a receiver, 5, the stanchions 10, the lanyards 25 and 29, secured to the said stanchions, the rope ends 27, secured to the said stanchions, and vibrators supporting the said receiver and secured to the said stanchions, for the purpose set forth.

4. In a life-saving device, the combination of the receiver 5, the stanchions 10, the vibrators 9, connecting said receiver with the stanchions 10, the lanyards 25 and 29, provided with the steps 28 thereon, the said lanyards terminating in the spare ends 27 and being so reeved through the stanchions that thereby the said stanchions 10 will be mutually supported, and when placed in position for use will insure the proper adjustment for attaching thereto the receiver 5, and the vibrators 30, connecting the said receiver with the lanyards 25 and 29, for the purpose set forth.

5. In a life-saving device, the combination of the receiver 5, the stanchions 10, the shoes 11, provided with the feet 12, attached to the said stanchions, the vibrators 9, connecting the said receiver to the stanchions 10, the lanyards 25 and 29, provided with the steps 28 thereon, the said lanyards terminating in the spare ends 27 and being so reeved through the stanchions 10 that thereby the said stanchions will be mutually supported, and when placed in position for use will insure the proper adjustment for securing thereto the receiver 5, and the vibrators 30, connecting the said receiver with the lanyards 25 and 29, for the purpose set forth.

384,924. CAR-WHEEL. FREDERICK C. MYERS, East Boston, Mass. Filed July 28, 1887. Serial No. 245,205. (No model.)

Claim.—1. A car-wheel having a loose tire retained and rotating upon the body of the wheel by means of spherical friction-balls, substantially as hereinbefore described, and for the purpose set forth.



2. A wheel-body having the cavity *h*, in combination with the plate *c* and filling-block *c*, provided with the stud or bolt and nut, substantially as described.

3. A wheel-body and tire each provided with the annular groove, in combination with the friction-balls, distance-pieces, and springs, substantially as described.

384,925. SPRING BED-BOTTOM. HENRY MYERS, Philadelphia, Pa. Filed Dec. 17, 1887. Serial No. 258,164. (No model.)

Claim.—The combination of a spring bed-bottom consisting of a slatted metal bottom frame, helical or spiral springs mounted on said frame at points where the slats thereof cross each other, and the lower extremities of said springs being held to place thereon in eyes formed in said slats, wires arranged in parallel courses and interlaced with each

884,925.

other and said springs, and with a border composed of coiled or spiral wires intertwisted together, thereby forming a solid elastic web-like form of top, in which all strain brought to bear thereon may be uniformly equalized throughout, as shown and described.

384,926. CARPET-STRETCHER. CHARLES C. F. HEIDEMANN, Fort Wayne, Ind. Filed Mar. 8, 1888. Serial No. 266,742. (No model.)

Claim.—In a carpet-stretcher, the combination of the following elements, namely: a guide-bar having at one end means for securing it to the floor, a movable head adapted to engage and hold a carpet and arranged to slide along said bar, a lever pivoted to the bar, and a pair of ratchet-bars pivoted at one end to the lever on opposite sides of its fulcrum and adapted to alternately engage with their free ends the movable head at each forward and backward movement of the lever, all substantially as specified.

384,927. PHOTOGENIC POWDER. HENRY G. PUFFARD, New York, N. Y. Filed Jan. 21, 1888. Serial No. 261,033. (No specimens.)

Claim.—As a new article of manufacture, an improved photogenic powder consisting of magnesium powder intimately mixed with wood powder of any similar nitro-lignin equivalent, substantially as and for the purpose specified.

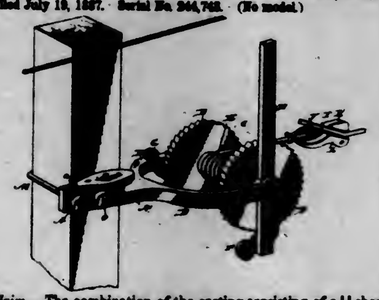
384,928. DRILL-CHUCK. ROBERT J. PRATT, Greenbush Heights, N. Y. Filed Feb. 14, 1888. Serial No. 264,062. (No model.)

Claim.—1. A chuck consisting of a main body portion having a hollow interior and screw-threaded at its forward end, said forward end being provided with slots or recesses, clamping-jaws located within said recesses and inclined or beveled at their forward ends, a follower against which said jaws abut, an eccentric for actuating said follower, and an internally-screw-threaded sleeve having a tapering aperture and engaging with the external screw-thread of the main body, substantially as described.

2. A chuck consisting of a main body portion having a hollow interior and screw-threaded at its forward end, said forward end being provided with slots or recesses, clamping-jaws located within said recesses and inclined or beveled at their forward ends, a follower consisting of a stem fitting said hollow interior, and side wings against which the clamping-jaws abut, an eccentric for actuating said follower, and an internally-screw-threaded sleeve having a tapering aperture and engaging with the external screw-thread of the main body, substantially as described.

3. A chuck consisting of a main body portion having a hollow

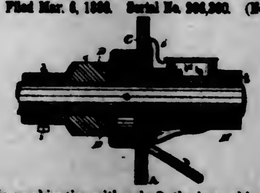
interior and screw-threaded at its forward end, said forward end being provided with slots or recesses, clamping-jaws located within said recesses and inclined or beveled at their forward ends, a spring connecting and distending said jaws, a follower against which said jaws abut, an eccentric for actuating said follower, and an internally-screw-threaded sleeve having a tapering aperture and engaging with the external screw-thread of the main body, substantially as described.



4. A chuck consisting of a main body portion having a hollow interior and screw-threaded at its forward end, said forward end being provided with slots or recesses, clamping-jaws located within said recesses and inclined or beveled at their forward ends, a spring connecting and distending said jaws, a follower consisting of a stem fitting said hollow interior, and side wings against which the clamping-jaws abut, an eccentric for actuating said follower, and an internally-screw-threaded sleeve having a tapering aperture and engaging with the external screw-thread of the main body, substantially as described.

5. In a chuck, the combination, with the clamping-jaws, of a spring, said jaws being provided with recesses having overlapping flanges for the reception and retention of the spring, and one of the jaws having a projection against which the ends of the spring abut, substantially as described.

6. In a chuck, the combination, with the main body portion, sleeve, clamping-jaws, and follower, of an eccentric having its shaft journaled in the walls of the main body of said chuck and substantially flush therewith, said eccentric-shaft having at one end an aperture for the reception of an adjusting key or wrench, substantially as described.



7. In a chuck, the combination, with the main body portion, sleeve, clamping-jaws, and follower, of the eccentric described, consisting of a single piece of metal having at its central portion a cam projection and at its opposite ends bearings or gudgeons adapted to turn within the walls of the main body of the chuck, one of said gudgeons being slotted transversely for the reception of an operating key or wrench, substantially as described.

884,929. WIRE-STRETCHING MACHINE. CHESTER V. PERRY, Bowing Green, Me., assignor to WILLIAM A. HUTCHINSON, same place. Filed July 19, 1887. Serial No. 244,742. (No model.)

Claim.—The combination of the casting consisting of a U-shaped portion having the arms B B and the arm A, extending centrally rearward from the U-shaped portion, the said arm A projecting above the plane of the U shaped portion of the casting, and having the transverse perforation *a* in its rear end and the extended open-ended notch A′ in its front portion, the rope M, passed through the perforation *a*, provided with the knots or stops N O, and adapted to engage the notch A′, the drum C, journaled in and between the free ends of the arms B B and provided with the ratchet wheels or disks D D, the lever E, loosely mounted on the spindle of the drum between one of the disks D and arm B and depending below said drum, the pawl E, pivoted on the lower end of the lever and engaging the adjacent disk, and the pawl G, pivoted to the opposite arm B and engaging the disk adjacent thereto, substantially as specified.

884,930. HORIZONTAL THRUST-BEARING. ALVA C. REED, Dayton, Ohio, assignor to the Stivell & Reeve Manufacturing Company, same place. Filed Mar. 6, 1888. Serial No. 266,260. (No model.)

Claim.—1. In combination with a shaft, the journal-box composed of the sleeve-journal E, having the annular flange D, step *c*, and bearing *d*, secured to the shaft, substantially as specified.

2. In combination with the step *c*, shaft *a*, and bearing *d*, the journal-box E, provided with air-chambers *h*, substantially as specified.

3. In combination with the shaft, the step *c*, bearing *d*, sleeve-journal E, provided with the air-chamber *h*, and pipe A, tapping said chamber, substantially as specified.

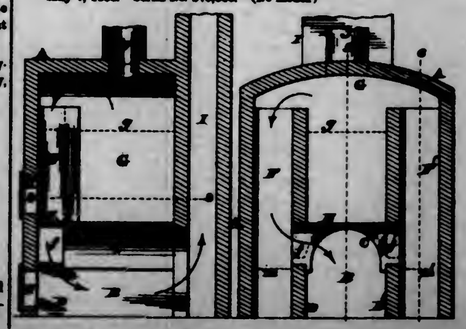
4. In combination with the shaft *a*, bearing *d*, and step *c*, the journal E, provided with the flange C, substantially as specified.

5. In combination with the shaft *a*, bearing *d*, and step *c*, the journal E, provided with the flange C, and lubricating-cup *e*, substantially as specified.

884,931. STOCK-CAR. ROYAL H. RIPLEY, Minneapolis, Minn. Filed Apr. 4, 1888. Serial No. 269,851. (No model.)

Claim.—1. The combination, in a stock-car provided with the series of posts 3, of the hay-receptacles 9, having a bottom, 11, and projecting outward beyond said posts and extending between the posts to their inner surface, and the folding racks hinged at their lower edges to the wall of the car and forming the inner walls of said receptacles, substantially as described.

2. The combination, in a stock-car provided with the series of posts 3, of the hay-receptacles 9, having bottoms 11 projecting outward beyond said posts and extending between the posts to their inner surface, the doors in the outer walls of said receptacles, and the folding racks hinged at their lower edges to the wall of the car and forming the inner walls of the receptacles, substantially as described.



3. The combination, with the stock-car provided with the series of posts 3, of the hay-receptacles 9, arranged partially between and partially outside of said posts, and provided with closed bottoms and with racks at their inner sides secured to the inner surface of the walls of the car, and the water-troughs 19, arranged beneath said hay-receptacles and provided with recesses fitting around said posts, substantially as described.

4. The combination, in a stock-car, of a hay-receptacle arranged entirely outside of the inner surface of the wall of the car and a folding rack hinged to the inner surface of the wall of the car at or near the bottom of the receptacle, and adapted to be turned down to an inclined position within the car or to be folded up flush against the wall of the car, substantially as described.

5. The combination, in a stock-car provided with the series of posts 3, of the hay-receptacles 9, having bottoms 11 projecting outward beyond said posts and extending between the posts to their inner surfaces, the folding racks secured to the inner surface of the walls of the car, forming the inner sides of said receptacles, and the water-troughs arranged beneath said receptacles, and the projecting outward beyond the posts and inward to their inner surfaces, substantially as described.

6. The combination, in a stock-car having the adjustable partitions 25, of the water-troughs and the pipes 29, extending longitudinally in said car and forming supports for said partitions, and also forming conductors for conveying the water to said troughs, substantially as described.

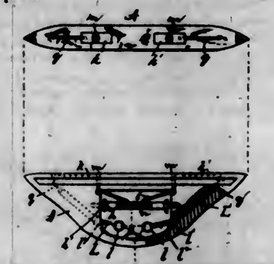
884,932. DRY CLOSET. LUMAN B. REED, Cincinnati, Ohio. Filed May 7, 1888. Serial No. 273,060. (No model.)

Claim.—1. The combination, in a cremating-closet, of a deposit-chamber having means of loading sewage, &c., into the same, a furnace for drying the sewage, an exit for said furnace, and a diverging flue communicating with said chamber and discharging into the furnace at or near the front of the same, for the purpose described.

2. The combination, in a cremating-closet, of furnace B, diverging flues F F′, openings *f f′*, deposit-chamber G, doors H K, exit I, inlet J, and pits L L′, which latter are charged with a non-combustible absorbent-bed, as M, for the purpose described.

884,933. BLANK-BOOK. JAMES H. REED, Syracuse, N. Y. Filed Nov. 11, 1886. Serial No. 218,614. (No model.)

Claim.—1. The combination, in a book, of a signature and a guard united by means of stitching carried through the middle of the signature and through the guard from its outer to its inner edge, substantially as shown, and for the purpose set forth.



2. A book comprising the leaf-sections, a backing, guard-leaves interposed between each section and the backing, and the binding-stitches carried from the center of the respective sections through the corresponding guard-leaves to the backing, substantially as described.

3. A book embodying leaf-sections, a backing, and guard-leaves, through the center of which a stitching-cord is carried from the respective sections to the backing, and keeper-cords to support the guard-leaves transversely, substantially as described.

4. A book comprising leaf-sections, a backing, guard-leaves interposed between each section and the backing, and binding-stitches carried from the center of the respective sections through the corresponding guards to the backing, in combination with flexible stay-strips secured to the guards and sections at their meeting point, substantially as described.

884,934. ELECTRIC STOPPING MECHANISM FOR LOOMS. JOHN BEAN and EDWIN CLEVELAND, Norwich, Conn. Filed Dec. 1, 1887. Serial No. 256,620. (No model.)

Brief.—The batten carries an electro-magnet the armature of which is provided with a latch adapted to engage one arm of a bell-crank lever connected to the belt-shipper. When the filling breaks or runs out or a warp-thread breaks, the circuit is completed through the shuttle, the latch engages the bell-crank lever, and the belt is shifted. The battery-wires are connected to metallic plates, back of the shuttle-race, and the shuttle-body is provided with similar plates, which register therewith. The shuttle-bobbin is metal or metal-jacketed, and the brake bearing thereon is connected to the plates in the back. The tension-springs are also connected to said plates. The back of the shuttle is also provided with a spring-bow pivoted to one plate, and which, when depressed by a broken warp-thread, makes connection with the other plate.

Claim.—1. In combination with the belt-shipper, shipper-rod, and batten of a loom, devices for actuating said shipper to effect the stopping of the loom, consisting of an electro-magnet moving with the batten, an armature for said magnet formed as a latch or hook, a bell-crank lever, one of whose arms is pivoted to the said shipper-rod and the other arm is in the path of said armature-hook, as set forth, a battery, wire-connections leading from said magnet and battery into the path of the shuttle, and a shuttle with metal-jacketed bobbin having wires leading therefrom adapted to engage the wire-connections first above described, as and for the object specified.

2. In combination with the belt-shipper, shipper-rod, and batten of a loom, an electro-magnet moving with the batten, an armature for said magnet formed as a latch or hook, a bell-crank lever, one of whose arms is connected to said shipper-rod and the other arm is in the path of said armature, as set forth, a battery, wire-connections leading from said magnet and battery into the path of the shuttle, and a shuttle provided with the bow-shaped wire *w*, plates *k k′*, screws *m m*, and pin *n*′, said wire *w* being formed with retaining-heads *s*′, all substantially as and for the purpose specified.

2. The combination, with the belt-shipper and batten of a loom, of the slidable rod K, a bell-crank lever, one of whose arms is pivoted to said rod, a reciprocating electro-magnet whose armature is provided with a hook adapted to engage and operate said bell-crank lever when an electrical current is passed through said magnet, and devices, as herein described, for controlling said electrical current, for the purpose specified.

4. In combination with the batten and belt-shipper of a loom, an electro-magnet, a battery, wires leading from said magnet and battery into the path of the shuttle, mechanism connected therewith for moving the belt-shipper, as herein set forth, and a shuttle having combined therein a metal-jacketed bobbin, spring-brake *i*, screws *m*, and plates *k k′*, all substantially as and for the purpose specified.

5. In combination with the batten and belt-shipper of a loom, an electro-magnet and a battery, wires leading therefrom into the path of the shuttle, mechanism for moving the belt-shipper, and a shuttle having combined therein plates *k k′*, screws *m*, wires *w*, and steel *n*′, all being substantially as and for the purpose specified.

6. In combination with the batten and belt-shipper of a loom, an electro-magnet and battery, wires leading therefrom into the path of the shuttle, mechanism connected therewith for moving the belt-shipper, and a shuttle having combined therein plates *k k′*, wires *g*, springs L L′, with rings *l l*, bushings *l*′, and connecting-wires *p*, all being substantially as described, and for the object set forth.

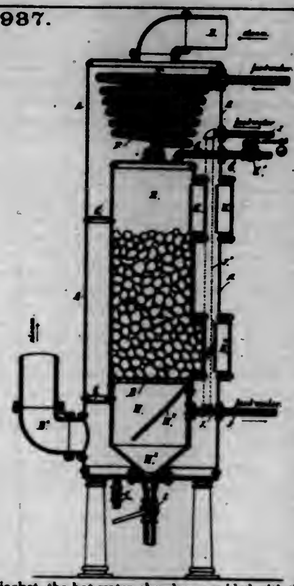
884,935. TEMPERING STEEL OR STEELY IRON. HENRI SEMMER, Le Creusot, France. Filed Nov. 1, 1887. Serial No. 253,597. (No specimens.)

Claim.—1. The process herein described of hardening steel or other metals, said process consisting in subjecting the metal to a hardening-bath and melting or fusing a solid body therein.

2. In the process of hardening steel or other metals, the mode herein described of maintaining the hardening-bath at a nearly uniform temperature while the hardening is going on by supplying the bath with a solid substance fusing or melting at the temperature of said bath.

3. The process herein described of hardening steel or other metals, said process consisting in subjecting the metal to a hardening-bath and pressing a solid fusible substance at the temperature of the bath in contact with the article to be hardened.

884,936. BUCKLE. ISAAC A. SMITH, Waterbury, Conn., assignor of one-half to Dwight L. Smith, same place. Filed Apr. 23, 1888. Serial No. 271,854. (No model.)



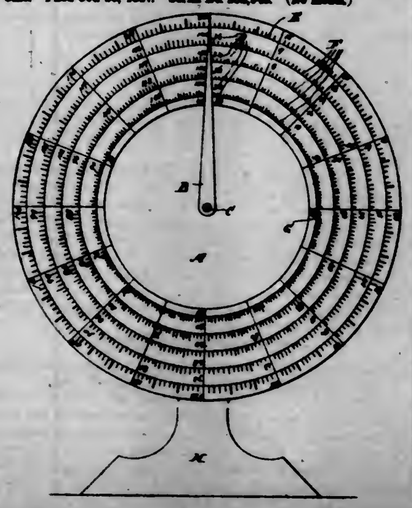
Claim.—1. The herein-described buckle, the frame composed of the front A and the back B, the front and back united at their ends to form a tubular frame through which the strap passes, combined with an L-shaped lever hinged to one of the said parts, and so that its jaw will extend toward the opposite part and with the said opposite part form a clamp within the tubular frame to engage the strap, the plane of the said back being inclined upward and toward the front, so as to contract the opening through the tubular frame at its upper edge, substantially as described.

2. The herein-described buckle, the frame composed of a front, A, and back B, united at their ends to form a tubular frame through which the strap passes, the back inclined upward and toward the front of the frame, so as to contract the opening through the frame toward the top, combined with an L-shaped lever hinged to the back, and so that its jaw will extend toward the front and with the said front form a clamp within the tubular frame to engage the strap, the arm of said lever inclined downward and forward toward the front, substantially as described, and so that the rear of the buckle presents a double-inclined surface toward the front.

884,937. FEED-WATER HEATER. DAVID STARR, San Francisco, Cal. Filed May 21, 1887. Serial No. 238,984. (No model.)

Claim.—1. An apparatus for heating and purifying feed-water, consisting of an inner filtering-cylinder under pressure and an outer shell or steam-jacket provided with a copper heating-coil leading from the supply-pipe or cold-water main into the head of the filtering-cylinder and adapted to discharge hot or heated water upon the filtering material when heated by exhaust-steam admitted to the outer shell

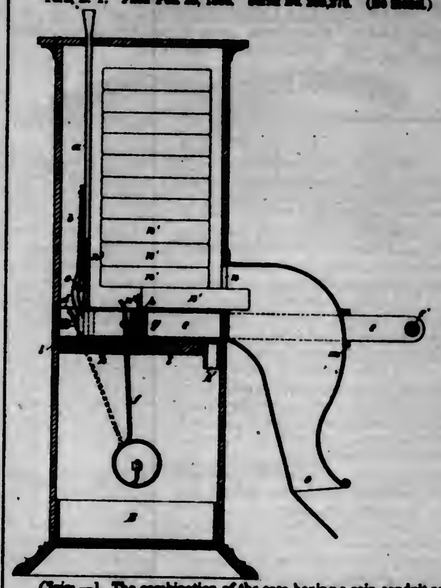
884,937.



or steam-jacket, the hot-water chamber provided with the deflecting-plate H^{x}, and the funnel-shaped mouth H^{3}, as set forth.

2. The feed-water heater and purifier herein described, consisting in an inner cylinder under pressure, provided with an upper chamber and superposed filtering material, in combination with an outer shell or steam-jacket having inlet and outlet ports or pipes and a water-heating coil therein, through which water heated by the exhaust-steam from a boiler passes into the filtering-chamber, the hot-water chamber located below the filtering-chamber and provided with the deflecting-plate H^{x}, and the funnel-shaped mouth H^{3}, all arranged as set forth.

3. In a feed-water heater and purifier, the combination, with the filtering-chamber, steam-jacket surrounding the same, and heating-coil above, of the hot-water or draw-off chamber of the deflecting or sediment-conducting plate H^{x}, as and for the purpose specified.

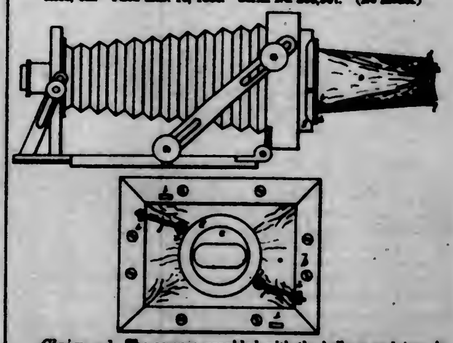


4. In a feed-water heater and purifier, the combination, with the inner filtering and purifying chamber or cylinder and outer shell or steam-jacket, of the man-holes K K K^{x} K^{x}, for the purpose of removing, cleansing, and replacing the filtering material, as specified.

884,938. TOLL-REGISTER. John K. Stewart, West Mansfield, Ohio. Filed Oct. 20, 1887. Serial No. 252,945. (No model.)

Claim.—The dial A, provided with circles E F G, marked with numerals, and the column D, also marked with numerals, in combination with the movable pointer B and the base H, whereby the whole may be attached to a weighing-scale or other object, as and for the purpose set forth.

884,939. VENEER APPARATUS. Lorenz Schlattmeir, Schapen-the-Rhine, Prussia, Germany, assignor to John H. Williams, New York, N. Y. Filed Feb. 23, 1888. Serial No. 265,272. (No model.)

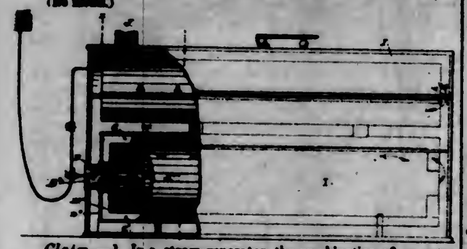


Claim.—1. The combination of the case having a coin conduit or chute, a bar having steps and a coin-opening, a drawer having a slot for receiving the coin, and a drawer-retracting spring, substantially as described.

2. The combination of the case having a coin conduit or chute provided with a slot, a bar having steps and a coin-opening, the drawer having a slot for receiving the coin, the drawer-retracting spring, and the spring having a pin to enter the slot in the conduit or chute, substantially as described.

3. The combination of the case having a coin conduit or chute, the movable steps, the pivoted levers supporting the steps and having counter-weights *g*, adapted to strike chimes located in their path, and the drawer having a slot for receiving the coin, substantially as described.

884,940. PHOTOGRAPHIC CAMERA. Hadwin Swain, San Francisco, Cal. Filed Mar. 16, 1888. Serial No. 267,207. (No model.)

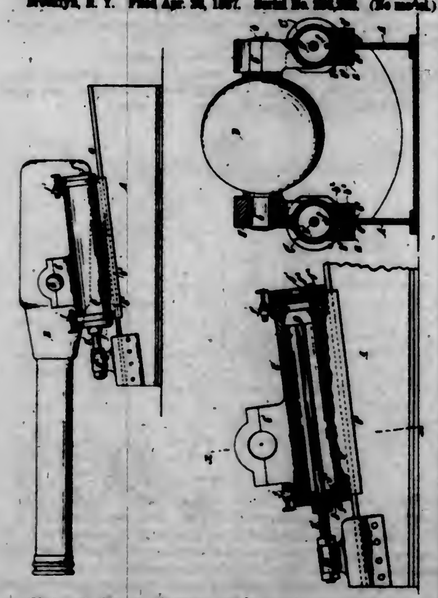


Claim.—1. The camera provided with the bellows and lens, in combination with the cloth tube *c* and an adjustable eye-piece provided with the elongated opening secured thereto, substantially as and for the purpose set forth.

2. The camera provided with the bellows and lens, in combination with the cloth tube *c*, having the ring *d* connected thereto, and the adjustable eye-piece provided with the elongated opening mounted in the ring, substantially as described.

3. The combination, with the camera provided with the bellows and lens, of the cloth tube *c*, having the ring *d*, and the stretching-rods *f f*, secured to the main camera-box and adapted to engage eyes in the ring *d*, substantially as and for the purpose set forth.

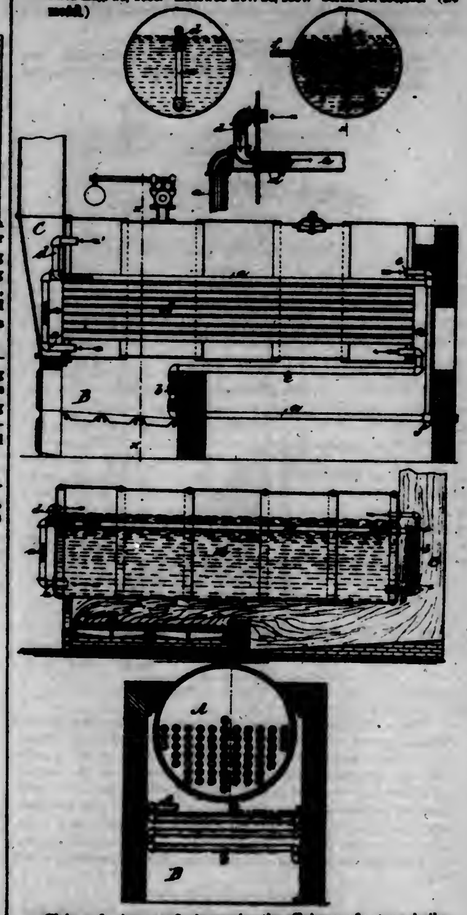
4. A cloth tube, *c*, in combination with main frame *a*, stretching-rods *f f*, ring *d*, and eye-piece *e*, substantially as described.



884,941. STEAM-GENERATOR. Elias H. Thompson, Everett, assignor of one-half to E. J. Gantt and J. B. Welch, Tulare, and Cornelius A. Sherman, Los Gatos, Cal. Filed Oct. 14, 1887. Serial No. 252,022. (No model.)

Claim.—1. In a steam-generator, the combination of an outer shell, A^{xx}, and an inner shell, A^{x}, the heads B^{x} and B^{xx}, extending inward past the shell A^{x}, all around at each end thereof, and having the thimbles B, connecting the said heads, substantially as described, and the water-tubes E, placed in a circle all around the fire-flue and communicating at each end with the water-chamber between the shells A^{x} A^{xx}, as and for the purpose set forth.

2. In a steam-generator, the combination, with a cylindrical fire-flue contracted all around at both ends, a water-chamber surrounding said fire-flue on the sides and over a portion of the ends, and thimbles connecting the walls of the ends, of a series of water-tubes extending longitudinally through the said fire-flue on all sides thereof and communicating with the water-chamber at the ends, substantially as and for the purpose set forth.



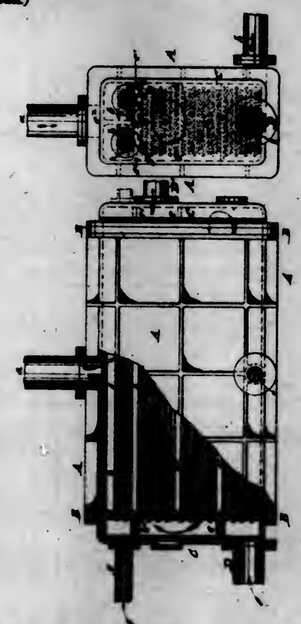
884,942. GUN-CARRIAGE. Louis H. Tuers, New Brighton, assignor of two-thirds to George H. Allen, New York, and Edward H. Reid, Brooklyn, N. Y. Filed Apr. 30, 1887. Serial No. 236,352. (No model.)

Claim.—1. The combination, with a cannon, of a carriage therefor having inclined sides upon which said cannon is supported, a cylinder, a piston within said cylinder, and a valve near each end of said cylinder, said piston and cylinder being one connected with the cannon and the other with a rigid support, and the said valves being alternately opened and closed according as the cannon is moved in one direction or the other by atmospheric pressure, substantially as specified.

2. The combination, with a cannon, of a carriage therefor having inclined sides upon which said cannon is supported, a cylinder, a piston within said cylinder, a valve near each end of said cylinder, said piston and cylinder being one connected with the cannon and the other with a rigid support, and a stop-cock near each end of said cylinder, the said valves being alternately opened and closed according as the cannon is moved in one direction or the other by atmospheric pressure, substantially as specified.

884,948. STEAM-BOILER. Charles H. Tuttle, New York, N. Y. Filed Aug. 30, 1883. Renewed Nov. 22, 1887. Serial No. 255,255. (No model.)

Claim.—1. A means for increasing the efficiency of a steam-boiler, consisting of a pipe located within said boiler and extending from end to end thereof, in combination with one or more steam pipes or jets having communication therewith, said first-mentioned pipe being adapted to receive water and steam from said boiler at or near one end thereof and to discharge the same at or near the opposite end, substantially as and for the purpose set forth.



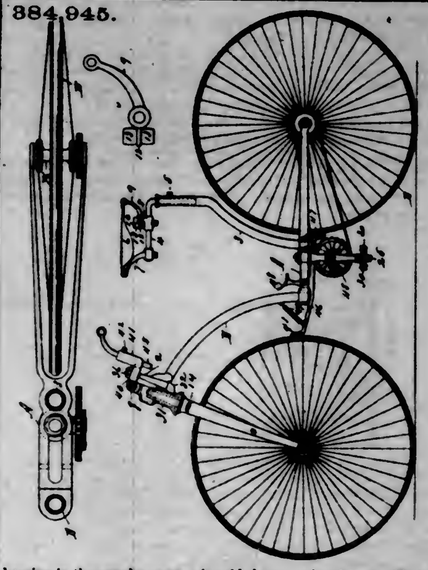
2. A means for increasing the efficiency of a steam-boiler, consisting of one or more circulation-pipes combined therewith and adapted to receive water therefrom at or near the front or fire-box end thereof, said pipe or pipes extending to the rear or colder end of the boiler and communicating with a conduit opening into such rear end, in combination with one or more steam pipes or jets having communication with the said circulation pipe or pipes or with said conduit, whereby the water and steam entering the said circulation pipe or pipes are discharged into the rear or colder end of the boiler and the circulation increased, substantially as and for the purpose set forth.

3. A means for increasing the efficiency of a steam-boiler, consisting of one or more coils or conduits disposed to be heated by the fire, and a feed-water pipe communicating with said coil, in combination with one or more pipes adapted to bring water from the boiler, one or more steam pipes or jets made to enter said water-pipe or said conduit, and a return-pipe for discharging the water from said conduit into the boiler, the whole being arranged substantially as and for the purpose set forth.

4. A means for increasing the efficiency of a steam-boiler, consisting of the pipe *a*, coil *b*, and return-pipe *c*, the same being arranged in the manner shown and described, for the purpose set forth.

5. A means for increasing the efficiency of a steam-boiler, consisting of the pipe *a*, coil *b*, and return-pipe *c*, arranged as described, in combination with the steam-pipes *d* and *e*, substantially as and for the purpose set forth.

384,944. SURFACE-CONDENSER AND WATER-HEATER. WILLIAM B. VOLK, New York, N. Y. Filed Dec. 28, 1887. Serial No. 259,290. (No model.)



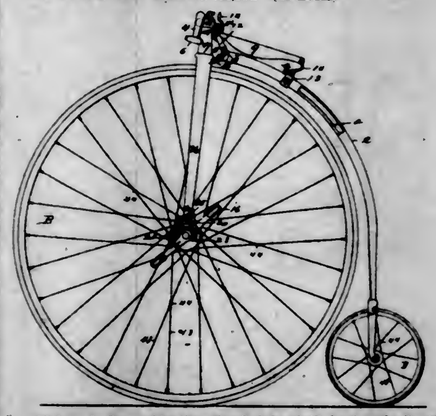
Claim.—In a surface-condenser, the combination, with a series of condensing-tubes arranged at the lower part of the condenser-casing, of a series of feed-water-heating tubes located above and parallel with said condensing-tubes, tube-heads supporting both the heating and condensing tubes, and bonnets provided with horizontal division-plates for separating the water-spaces of the condensing and feed-water-heating tubes, and with a vertical partition-plate located in the bonnet or bonnets of the feed-water-heating pipes intermediately between the feed-water supply and discharge pipes, substantially as set forth.

384,945. VELOCIPEDE. GEORGE T. WARWICK, Springfield, Mass., assignor to the Warwick Cycle Manufacturing Company, same place. Filed May 18, 1887. Serial No. 238,502. (No model.)

Claim.—1. A velocipede-saddle consisting of a seat, 6, of leather or similar material, a spring-box, 8, attached to the frame of the machine beneath the seat, a rigid arm, 9, pivoted to and having one end extending into said spring-box and its upper end extending upward and connected with the rear end of said seat, two springs inclosed in said box, between which the lower end of said arm extends, and an arm, 7, attached to said frame and having the forward end of said seat connected thereto, substantially as set forth.

2. A ball-bearing for velocipedes and analogous vehicles, consisting of the cylindrical case 15, having the internal projections, *n*, the sleeve 18, extending through said case, having an annular groove therein, the ball-case E, consisting of an internally-grooved transversely-divided ring having the beveled projections 230 thereon and the depressions 22, a series of balls inclosed in said ring, having a

384,945.



bearing in the annular groove in said sleeve, and a ring-nut, 23, having one end beveled and a screw-connection with the interior of said case 15, and engaging with said ball-case, whereby its parts are drawn together, combined and operating substantially as set forth.

3. The combination, with a velocipede fork-head having a socket in its lower end, of a fork having a spindle thereon entering said socket, and a rubber thimble, 50, interposed between said spindle and the inner sides of said socket, substantially as set forth.

4. The handle-bar holder 44, combined with the holder-frame 40, having a socket to receive the end of said holder, and having a pivotal connection with the upper end of the fork-head, and a set screw or screws to lock said holder in the frame and permit of its adjustment therein, substantially as set forth.

384,946. VELOCIPEDE. GEORGE T. WARWICK, Springfield, Mass., assignor to the Warwick Cycle Manufacturing Company, same place. Filed Dec. 1, 1887. Serial No. 256,564. (No model.)

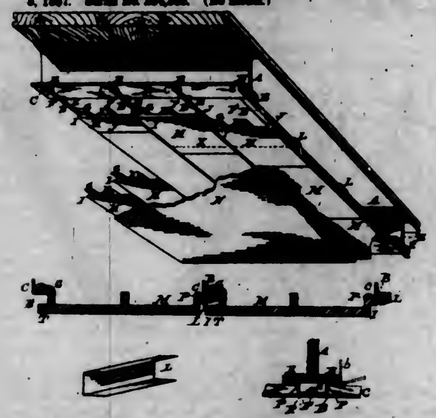
Claim.—1. In combination, the fork-head 47, having the lip 48, the handle-bar head fitting on said fork-head having a lip, 46, and a suitable bolt passing through said lips, substantially as set forth.

2. A bicycle-handle consisting of the prong-support 7, having prongs thereon holding the hand-grip part 6 at an incline to the axis of said support, substantially as set forth.

3. In combination, the handle-bar 4, the handle consisting of the longitudinally-perforated prong-support 7, receiving the end of said bar and having prongs thereon holding the hand-grip part 6 at an incline to the axis of said support, said handle being capable of turning on said bar, substantially as set forth.

4. In combination, the saddle 9, the rear brace, 10, thereof having the arm *c* engaging with the backbone, the front straps, 12, one having thereon the hook *b* and one having the lever 14 thereon, the trigger 15, engaging with said hook, and the front wheel, B, substantially as set forth.

5. A ball-bearing consisting of the outer case, 19, having a partially screw-threaded interior, the two internally-grooved segments 20, each having the teeth *i* thereon, the grooved sleeve 27, a series of balls, *n*, fitting the grooves in said segments and sleeve, the washer 25, having a spiral rib engaging with said teeth *i* and having a geared periphery, the locking-washer 26, screwing into said case, and the pinion 21, engaging with said washer 25, combined and operating substantially as set forth.



6. In combination with the ball-bearing case 19, having the spring-stops 23 and the post 24 thereon, the posts 31, fixed on said stops, the springs 32, the yoke 30, having legs bearing on the latter-named springs and engaging with the posts 31, the spring 33, interposed between said case and said yoke, and the fork-leg pivotally connected to said yoke, substantially as set forth.

7. The yoke 30, having the projecting step 36, the fork-leg pivoted to said yoke and having the step 37, extending over said step on the yoke, combined with the spring 39, interposed between said two steps, substantially as set forth.

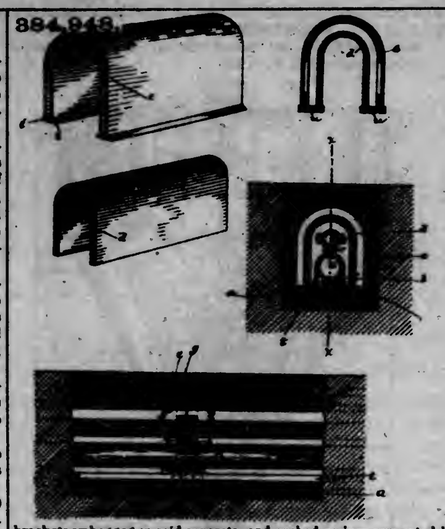
8. In combination with the spokes of a bicycle-wheel, the double longitudinally-perforated sleeve 44, fixed on said spokes at their point of intersection, substantially as set forth.

9. As means for adjusting and holding the grooved segments 20 of the ball-bearing, said segments each having the teeth *i* thereon, combined with the washer having a spiral rib thereon engaging with said teeth, substantially as set forth.

384,947. FIRE-PROOF CEILING. PIERCE B. WIGHT, Hyde Park, Ill., assignor to the Wight Fire Proofing Company, of Illinois. Filed Nov. 5, 1887. Serial No. 254,262. (No model.)

Claim.—1. The L-beams C B, in combination with the tiles M, provided with elevated projecting ends, and the metal clamps L, applied as specified.

2. The hangers consisting of the level parts E, vertical parts P, and the overlapping parts E E, in combination with the L-beams B C, I-beams A, and fastenings F *a*, as specified.



3. The ceiling-tile M, provided with the elevated part G, supported on the L-beam B C, and the groove between it and the end T, the elevated projecting part I, lying on the under side of the L-beam, in combination with the I-beams A, L-beams B C, the hangers E P E, and fastenings F *a*, as specified.

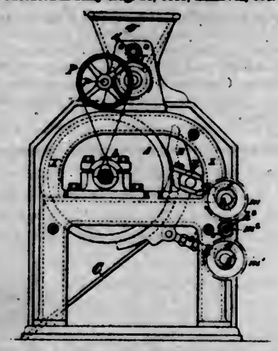
384,948. CONDUIT FOR UNDERGROUND PIPES. THOMAS J. YORK, Boston, Mass., assignor, by mesne assignments, to HIRAM C. L. PERRIN, and MARK WILSMITH, all of same place. Filed Feb. 23, 1888. Serial No. 264,982. (No model.)

Claim.—1. The combination, with a trench and a pipe or pipes therein, of a bed of concrete or like material and supports for said pipes embedded in said concrete, and arched casings supported by said bed and covering the pipe or pipes.

2. The combination, with a trench and a pipe or pipes therein, of a supporting-bed of concrete or like material having a water-conducting drain or groove formed in it under said pipes, pipe-supporting

384,948.

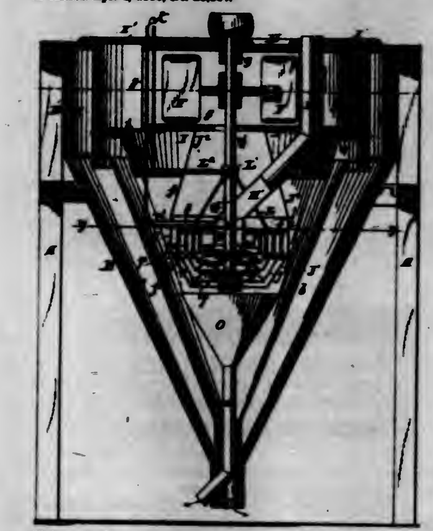
brackets embedded in said concrete, and arched casings supported by said bed and covering the pipe or pipes.



3. The combination of a trench, a heat-conducting pipe or pipes therein, inner casing-sections covering said pipes, outer casing-sections covering the inner sections and separated therefrom by an air-space, whereby loss of heat is reduced, said sections being placed end to end, and protectors *g g* for the joints of said sections, as set forth.

4. The improved casing or conduit for underground pipes hereinbefore described, the same consisting of a bed or base formed in the bottom of a trench, and two series of arched casing-sections supported by said bed, one within the other, and separated by an air-space, the inner section containing the pipe or pipes to be protected and the outer section supporting the filling of the trench, as set forth.

5. The improved casing or conduit for underground pipes hereinbefore described, the same consisting of a bed or base of originally plastic material formed in the bottom of a trench, and two series of arched casing-sections having their edges embedded in the material of said bed, said sections being separated by an air-space, as set forth.



6. The improved casing or conduit for underground pipes hereinbefore described, composed of the concrete bed, the smaller inner casing-sections having their edges embedded in said bed, and the larger outer sections having flanged edges also embedded in said bed, as set forth.

384,949. GRINDING-MILL. GIOVANNI ZOLLA and GIUSEPPE BELLA, Venice, Italy. Filed July 11, 1887. Serial No. 243,963. (No model.) Patented in Italy Aug. 20, 1886, XXXVII, 101.

Claim.—The combination, with the grinding-cylinder A, of the concave B, the shafts *h h'*, the eccentrics *f* and *g*, the eccentric-straps *e e'*, pivoted to the concave, the pinions *m m'*, mounted on shafts *h h'*, respectively, and the idler m^2, mounted on shaft h^2 and gearing with pinions *m m'*, and means for rotating said shaft h^2, said parts being arranged for co-operation as and for the purpose specified.

384,950. SEPARATING-MACHINE. NOAH W. HEIL, Manchester, Mich. Filed Mar. 9, 1888. Serial No. 266,715. (No model.) Patented in Canada Apr. 4, 1888, No. 28,897.

Claim.—1. In a separating-machine, the combination of a fan, an aspirating-chamber below the fan and connected with the eye of the fan, and a separating-chamber surrounding the aspirating-chamber and connected to the mouth of the fan, whereby air put in motion by the fan is caused to travel continuously through the fan, the aspirating-chamber, and the separating-chamber, substantially as set forth.

2. In a separating-machine, the combination of a fan, an aspirating-chamber below the fan and connected with the eye of the fan, a funnel-shaped separating-chamber surrounding the aspirating-chamber and connected to the mouth of the fan, whereby the air-current put in motion by the fan has imparted to it a whirling motion within the separating-chamber and travels in a circular path of reduced diameter after leaving the fan and before entering the lower part of the aspirating-chamber, substantially as set forth.

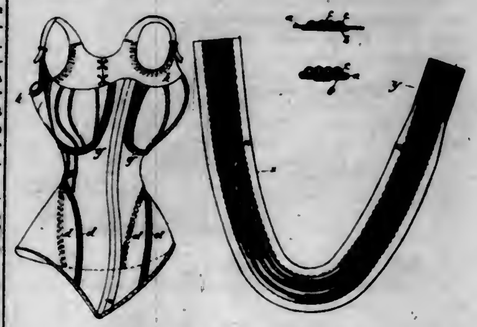
3. In a separating-machine, the combination of a fan, an aspirating-chamber below the fan and connected with the eye of the fan, a separating-chamber surrounding the aspirating-chamber, and a shelf interposed between the outer wall of the separating-chamber and the aspirating-chamber, substantially as set forth.

4. In a separating-chamber, the combination of a fan, a fan-casing provided with vertical walls around the blades of the fan, a separating-chamber the upper part of which surrounds the fan, and an aspirating-chamber below the fan and connected with its eye, the lower part of the aspirating-chamber being arranged within the funnel-shaped part of the separating-chamber, substantially as set forth.

5. In a separating-machine, the combination of a fan, an aspirating-chamber below the fan, and a series of valves arranged in the air-passages of the aspirator above the point at which the air-currents first act upon the falling material within the aspirating-chamber, substantially as set forth.

6. In a separating-chamber, the combination of a fan, an aspirating-chamber, a separating-chamber surrounding the aspirating-chamber, a funnel-shaped shell open at its upper end and interposed between the outer shell of the separating-chamber and the aspirator, and a downward-projecting flange arranged between the upper open end of the funnel-shaped chamber and the outer wall of the separating-chamber, substantially as set forth.

7. In a separating-machine, the combination, with the outer casing, B B', of the shell C, the fan within the shell C and opening into the chamber between the casing B B' and shell C, the aspirating-chamber below the fan and connected with the eye thereof, a discharge-opening at the bottom of the casing B B', and the hopper below the aspirating-chamber, provided with a discharge-spout, *e*, substantially as set forth.



8. In a separating-machine, the combination of the outer casing, the fan arranged within the outer casing, the aspirating-chamber below the fan, the valves, and a lever, L^3, in the wall of the aspirator-chamber, substantially as set forth.

9. In a separating-machine, the combination of the outer casing, the fan within the outer casing, the feeder within the aspirating-chamber, and the lever *s'*, pivoted in the wall of the aspirating-chamber, substantially as set forth.

10. In a separating-machine, the combination of the outer casing, the fan, the aspirating-chamber within the outer casing connected with the eye of the fan above the feeder within the separating-chamber, and the feed-spout arranged eccentric to the fan and passing through the separating-chamber and through the wall of the aspirating-chamber, substantially as set forth.

REISSUES.

10,989. CORSET. CATHARINE A. GREWOLD, New York, N. Y. Filed Dec. 30, 1887. Serial No. 259,494. Original No. 366,348, dated Feb. 22, 1887.

Claim.—A corset provided with the described re-enforcing strips having substantially parallel longitudinal edges secured upon the outside of the corset-body and extending from the top or bottom edge of said body in more or less of a curve over and upon said body and toward but not beyond the waist-line of the corset, and with both extremities terminating at one and the same edge of said corset-body, as and for the purpose set forth.

NORRIS PETERS

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

MARSH *v.* REIN *v.* RUPPEL.

Decided June 9, 1888.

1. IS A WIFE A COMPETENT WITNESS FOR HER HUSBAND IN AN INTERFERENCE PROCEEDING BEFORE THE PATENT OFFICE?

The question as to whether husband and wife are competent and compellable to testify for or against each other must be determined by the law in force in the jurisdiction in which the Patent Office is located, whether that jurisdiction may be said to be the entire United States or the District of Columbia. The question of competency must be determined in accordance with either the common law, the statute law, or both.

2. WHAT RULE OF EVIDENCE MUST BE OBSERVED BY THE COMMISSIONER OF PATENTS IN THE DISCHARGE OF HIS LIMITED JURISDICTION?

While the Commissioner of Patents is authorized to establish rules and regulations for taking depositions, he is necessarily compelled to proceed under and in accordance with the laws of Congress. He has no power to legislate as to the competency of witnesses, nor as to the admissibility of evidence. Such rules of evidence as Congress establishes or recognizes for courts of general jurisdiction must be deemed to be prescribed for officers and tribunals of inferior and limited powers and jurisdictions, unless they are expressly excepted or special rules are made for them. While sections 876 and 877 (Rev. Stats. of the D. C.) do not specifically name the Patent Office, and may not be held to embrace it as a court or tribunal, still there has never been any law of evidence prescribed for it, except as it has been prescribed for the courts. In other words, the law of evidence recognized in the courts for their guidance, whether common law, statute law, or both, becomes, *proprio vigore*, the law for the Patent Office and other Bureaus, except when otherwise provided.

3. HUSBAND AND WIFE ARE NOT COMPETENT WITNESSES FOR OR AGAINST EACH OTHER IN INTERFERENCE PROCEEDINGS.

Inasmuch as it seems to be well settled that the common-law provision as to husband and wife is in force in the District of Columbia, it follows that husband and wife are not competent witnesses for or against each other in the tribunals and for the purposes mentioned in sections 876 and 877 of the Revised Statutes of the District of Columbia.

APPEAL on motion.

VAPOR-STOVES.

Application of James A. Marsh filed April 1, 1886, No. 197,371. Application of Bernard Rein filed January 25, 1886, No. 189,696. Application of Henry Ruppel filed November 20, 1885, No. 183,438.

Mr. H. T. Fisher and *Mr. W. H. Doolittle* for Marsh.

Mr. George H. Lothrop and *Mr. J. L. Norris* for Rein.

Mr. F. A. Lehmann for Ruppel.

HALL, *Commissioner:*

In this interference case Rein and Ruppel have taken the testimony of their respective wives in support of their respective claims to priority. Marsh moved before the Examiner of Interferences to strike out the testimony of the wives of Rein and Ruppel for the reason that they were not competent witnesses. The Examiner of Interferences overruled this motion, and Marsh has appealed to the Commissioner.

The question presented is whether a wife is competent as a witness for her husband.

Sections 4904, 4905, 4906, 4907, and 4908 Revised Statutes conclusively show that the Commissioner of Patents is an officer invested with what the Supreme Court of the United States in *Butterworth* v. *Hoe* (C. D., 1884, 429) declared to be *quasi-judicial* power. He is expressly authorized to take testimony, to hear the parties, and to decide. This constitutes judicial jurisdiction to the extent granted. The Patent Office is a Bureau in the Department of the Interior, is expressly established at the seat of Government—Washington—where its powers and jurisdiction are to be exercised. While the Commissioner of Patents is authorized to establish rules and regulations for taking depositions, he is necessarily compelled to proceed under and in accordance with the laws of Congress. He has no power to legislate as to the competency of witnesses, nor as to the admissibility of evidence. As to who is a competent witness, and as to whether husband and wife are competent and compellable to testify for or against each other in civil controversies, must be determined by the law in force in the jurisdiction in which the Patent Office is located, whether that jurisdiction may be said to be the entire United States or the District of Columbia. The question of competency must be determined in accordance with either the common law, the statute law, or both. The Congress of the United States has established a rule of evidence for the courts of the United States. Section 858 of the Revised Statutes of the United States provides:

> In the courts of the United States no witness shall be excluded in any action on account of color, or in any civil action because he is a party to or interested in the issue tried. * * * In all other respects the laws of the State in which the court is held shall be the rules of decision as to the competency of witnesses in the courts of the United States in trials at common law, and in equity and admiralty.

The first clause of this section applies to the courts of the United States, wherever situated, and is uniform in its operation. The second clause incorporates the respective laws of the State in which a court is

held, and makes those laws a part of the Federal law, as much as if they were expressly enacted by Congress to be operative in the particular State.

By the common law, husband and wife were not competent or compellable to give evidence for or against each other. This rule was founded upon public policy. It has been modified in many of the States of the Union, in some of which it is provided that the testimony of the wife may be given for her husband in both civil and criminal procedure. But this section 858 of the Revised Statutes of the United States does not affect the common law relating to the competency of husband and wife, but simply removes the objection which existed on account of interest. This has been definitely settled by the Supreme Court of the United States in the case of *Lucas* v. *Brooks* (18 Wall., 436.) It consequently follows that, regardless of the territorial or local jurisdiction of the Commissioner of Patents, there is no Federal statute which changes the common law of evidence in this respect, unless it shall result from the legislation of Congress with reference to the District of Columbia.

Sections 876 and 877 of the Revised Statutes of the District of Columbia are cited as furnishing the legislation which covers this question. They are as follows:

SEC. 876. On the trial of any issue joined, or of any matter or question, or on any inquiry arising in any suit, action, or other proceeding in any court of justice in the District, or before any person having by law, or by consent of parties, authority to hear, receive, and examine evidence within the District, the parties thereto, and the persons in whose behalf any such action or proceeding may be brought or defended, and all persons interested in the same, shall, except as provided in the following section, be competent and compellable to give evidence, either viva voce or by deposition, according to the practice of the court, on behalf of any of the parties to the action or other proceeding.

SEC. 877. Nothing in the preceding section shall render any person who is charged with an offense in any criminal proceeding competent or compellable to give evidence for or against himself; or render any person compellable to answer any question tending to criminate himself; or render a husband competent or compellable to give evidence for or against his wife, or a wife competent or compellable to give evidence for or against her husband, in any criminal proceeding or in any proceeding instituted in consequence of adultery; nor shall a husband be compellable to disclose any communication made to him by his wife during the marriage, nor shall a wife be compellable to disclose any communication made to her by her husband during the marriage.

I think the decision of the Supreme Court of the United States in *Lucas* v. *Brooks*, *supra*, and also of the Supreme Court of the District of Columbia in the case of *Holtzman* v. *Wagner*, (5 Mackey, 15,) are conclusive that these sections do not operate to change the common law with respect to the competency of husband and wife as witnesses for or against each other.

My attention has been called to the case of *Workman* v. *McNaught*, (C. D., 1879, 129,) and also to that of *Koen* v. *Quint*, (C. D., 1883, 26.) In the former case Mr. Commissioner Paine held that in the United States a wife is not at common law a competent witness for her husband, and that section 858 of the Revised Statutes of the United States did not remove this disqualification in the courts of the United States. He also held that sections 856 and 857 of the Revised Statutes relating to the District of Columbia were intended for local courts and tribunals only, and not for national, international, or foreign courts or tribunals whose places of business happened to be within the District of Columbia, and that the Patent Office is not a local institution or tribunal for the adjudication of local interests, and is not, by reason of its location, subject to the statutory provisions relating to the law of evidence in the District of Columbia. He further held that the competency of witnesses in interference cases before the Patent Office is determined by the common law and the statutes, and is not subject to regulations by the Commissioner, whether with or without the approval of the Secretary. On the other hand, Mr. Commissioner Marble in the latter case (*Koen* v. *Quint*) held that a wife was a competent witness for her husband in an interference proceeding, and that the Office must be guided in framing rules for the production of evidence by sections 876 and 877 of the Revised Statutes relating to the District of Columbia, so far as it is not controlled by section 858 of the Revised Statutes of the United States.

Inasmuch as it seems to be well settled that the common-law provision as to husband and wife is in force in the District of Columbia, it follows that husband and wife are not competent witnesses for or against each other in the tribunals and for the purposes mentioned in sections 876 and 877. The common-law rule is definite and certain in that respect. But what rules or law of evidence govern, generally, the proceedings of the Patent Office? What rule of evidence must be observed by the Commissioner of Patents in the discharge of his limited jurisdiction? It is scarcely conceivable, with a civil code such as has been established by Congress for the District of Columbia, and with sections 876 and 877 operative and controlling all the tribunals located and exercising jurisdiction in the District of Columbia or at the seat of Government, that the Patent Office or other Bureaus or Departments of Government, authorized and required to exercise *quasi-judicial* power, to take, receive, and hear evidence, and adjudge the rights involved, are without any statutory law or provisions governing them and are subject to the common-law provisions alone.

It would be anomalous that procedure in the courts of general jurisdiction in the District should be controlled by statutes materially modifying and repealing the common law, but that the Bureaus should be governed by the common law unmodified and unrepealed. The correct view is that such rules of evidence as Congress establishes or recognizes for courts of general jurisdiction must be deemed to be prescribed for officers and tribunals of inferior and limited powers and jurisdictions, unless they are expressly excepted or special rules are made for them. Even though sections 876 and 877 do not specifically name the Patent Office, and may not be held to embrace it as a court or tribunal, still there has never been any law of evidence prescribed for it, except as it has been prescribed for the courts. In other words, the law of evidence recognized in the courts for their guidance, whether common law, statute law, or both, becomes, *proprio vigore*, the law for the Patent Office and other Bureaus, except when otherwise provided.

The Commissioner of Patents has no jurisdiction depending upon *mesne* or final process, nor upon the citizenship of parties. His authority in matters of this kind is limited to questions of interference and public use. But to exercise this jurisdiction power is given to procure the necessary evidence, and the procedure is the same as given to the Federal courts. The Commissioner has no power to subpœna witnesses, compel attendance, punish for contempt, &c. Such matters are expressly placed in the control of the Federal courts having jurisdiction where the depositions are being taken. But although the Patent Office is located at the seat of Government, and is governed by the law applicable to the courts established in the District of Columbia as to the competency of witnesses and of their evidence, and as to who may be compelled to give evidence, yet that law accompanies the procedure to take depositions, and compels the attendance of witnesses, and determines what are and what are not privileged matters, wherever the depositions may be taken. The jurisdiction which secures evidence to be used in the courts of the District of Columbia is in this respect co-extensive with the territorial jurisdiction of the United States; and what is true of the civil courts in this particular is equally true of the Patent Office. That is to say, if the rule of law as to the competency of witnesses be the common law, then the common law follows the procedure of the Patent Office into whatsoever State or Territory it may go for the purpose of taking depositions, and the local Federal court where the depositions are taken will enforce the common law, or whatever law is in force in the District of Columbia, where the evidence is to be used. It is necessary that this should be so, in order that perfect uniformity may prevail in the administration of the Office and in the determination of interference cases. If the competency of the witness were to be determined by the State in which he or she lived, one of the parties to an interference might be able to obtain the testimony of his wife, she being competent in the State in which he lived, while the other party could not secure the testimony of his wife, because living in a State by whose laws the wife was not competent as a witness. This may perhaps be better illustrated by reference to the circuit courts of the United States. As already stated, under section 858 the laws of the respective States as to the competency of witnesses are made the law of the circuit court, so that in Iowa, in the Circuit Court of the United States, the testimony of the wife would be competent in behalf of her husband, because the Iowa laws make the wife a competent witness. Now, if a controversy were pending in that court between a citizen of West Virginia and a citizen of Iowa, it is apparent that unless the laws of Iowa thus incorporated into the Federal statutes shall extend all over the United States for the benefit of the circuit court in that particular case, the citizen of Iowa could obtain and use the evidence of his wife in support of his case, while the citizen of West Virginia, by whose laws the testimony of the wife is incompetent in her husband's behalf, could not procure that of his wife.

I am therefore of the opinion that the common law prevails in respect to the competency of husband and wife to testify for or against each other, and that the testimony of the wife is incompetent in this case, also that this rule, so far as it applies to the Patent Office, is co-extensive with the territorial jurisdiction of the United States, and is unaffected by any of the local statutes of the States.

I am compelled therefore to reverse the decision of the Examiner of Interferences, and to hold that the testimony of the wives of Rein and Ruppel must be stricken from the record.

EX PARTE PAGE AND KRAUSSE.

Decided June 7, 1888.

1. A party who voluntarily takes his patent with full knowledge at the time that the specification or claims are defective and fail to cover his entire invention, or that the patent in other respects is inoperative or invalid, because of the omission of an amendment which he petitioned the Commissioner to admit, which petition was refused because of insufficient showing, cannot thereafter maintain an assertion of inadvertence, accident, or mistake, such as would justify the Office in granting him a reissue to correct the errors.
2. An applicant who has had his day in the Office, and whose application has received full consideration and has been passed to issue, ought not to be permitted to withdraw his case from issue and submit amendments which should have been earlier proposed, and thus put the Office to the trouble of making a reexamination. Unless a showing of irreparable injury is made to appear, such petitions will be denied and applicant required to file a new application covering the subject of his proposed amendment, or he may abandon his original application, pay a new fee, and file another application in the form desired.
3. The inadvertence, accident, or mistake contemplated by the statute relates to the form and character of the specification and claims as they stand at the date of issue. (*Ex parte Mahon*, 40 O. G., 915; 41 O. G., 1269.)

APPEAL from Examiners-in-Chief.

PROCESS OF AND APPARATUS FOR TREATING BARIUM SULPHATE.

Reissue application of William M. Page and Anna L. Krausse, executrix of Emil B. Krausse, deceased, filed June 20, 1887, No. 243,185.

Messrs. Knight Brothers for the applicants.

HALL, *Commissioner:*

This reissue application was rejected by the Primary Examiner for the reason that it did not appear that the alleged invalidity or inoperativeness of the patent heretofore issued was due to inadvertence, accident, or mistake, as contemplated by the statute. An appeal was taken by applicants to the Examiners-in-Chief, who, by a divided decision, affirmed the action of the Primary Examiner, and the case was brought before the Commissioner on appeal.

The facts are as follows: After the original application of William M. Page and Emil B. Krausse had passed to issue a petition was presented to the Commissioner requesting that the case be withdrawn from issue in order to enable applicants to file an amendment. The Commissioner's decision was rendered on the 18th of May, 1887, refusing the request and denying the petition. The decision was based upon the fact that the petition, which requested the withdrawal of the case from the issue, showed no valid reason why it should be granted. It is the well-settled practice in the Office that such petitions will not be granted unless they show that applicant will sustain some irreparable loss or damage if the amendment be not permitted. An applicant who has had his day in the Office, and whose case has received full consideration and has been passed to issue, ought not to be allowed to withdraw his application from issue and submit amendments which should have been previously submitted, and thus put the Office to the trouble of a reexamination. The practice just alluded to has become settled, and in such case an applicant is required to file a new application embracing the subject of the proposed amendment, pay the Office the fees contemplated, and he is then entitled to a new and original

examination. But it sometimes occurs that public use has intervened, or some other circumstances which render it practically impossible for an applicant to successfully prosecute a new application, and whenever this fact appears the Office with equal uniformity allows the application to be withdrawn from issue and amended. In the present case there was no such showing, and the Commissioner had nothing before him which would justify a departure from the well-established practice. Applicants failing to secure the introduction of their proposed amendment, and fully aware of the fact that the patent which would issue would not contain such amendment, saw proper to pay the final fee and take out the patent. This was done by the applicants presumably with a view of obtaining a remedy by reissue, for on the day after the issuance of the patent they prepared and executed the present reissue application and filed the same on June 29, 1887.

It is apparent from this statement of the case that the patent which issued on the 21st day of June, 1887, was not invalid or inoperative in respect to the proposed amendment by reason of any inadvertence, accident, or mistake existing in the minds of the applicants as to the form of the specification or as to what the application contained at the date the patent issued, for they were well advised that it was defective in the very particulars referred to, and notwithstanding that knowledge they saw proper to take the patent in that form.

If the omission to have the amendment, or matter covered by it, introduced into the application or incorporated in the patent had resulted from a mistake on the part of the Office, without any fault on the part of applicants, the mistake would undoubtedly have been corrected, either by an additional certificate or by breaking the seal of the old patent and issuing a new one, in accordance with the practice of the Office. If the omission is to be termed an inadvertence, accident, or mistake, the error occurred long anterior to the issuance of the patent, and, as just stated, was discovered and was capable of rectification by the applicants before the patent was issued to them. There was a clear remedy before them.

If, as suggested hereinbefore, when the petition to be allowed to withdraw the original case from issue for the purposes of amendment was presented to the Commissioner, a showing had been made that irreparable injury would result from a refusal, or that a new application could not be successfully prosecuted in consequence of the existence of public use or other circumstances, then such petition would have been allowed and the amendment would have been incorporated. If, however, no such conditions existed—as was unquestionably true in this case—applicants should have abandoned their original application, paid a new fee, filed a new application in the form desired, and taken their patent on such application. Instead of doing this they chose the other alternative and took out the patent in the objectionable form stated. It is true that in doing this applicants may have misconceived the proper remedy and the proper method to pursue; but it remains true, nevertheless, that at that time there was no inadvertence, accident, or mistake in their minds with reference to the character of the specification and claims embraced in their application, and it cannot be said of the patent that it is invalid or inoperative in consequence of such inadvertence, accident, or mistake as is contemplated by the statute.

In *ex parte Mahnken* (40 O. G., 915) I carefully considered the character of inadvertence, accident, or mistake which would justify a reissue, and reconsidered the subject in the same case, (41 O. G., 1269.) I adhere to the conclusion reached in those decisions, that the inadvertence, accident, or mistake contemplated by the statute is one which relates to the form and character of the specification and claims as they exist at the time the patent issues, and if a party voluntarily causes his patent to issue with a full knowledge at the time that such specification and claims are imperfect and fail to cover his invention, or that the patent in other respects is inoperative or invalid, the right to a reissue will not arise. Certainly such will be the case if before the patent issue there is any remedy furnished by the law or in the practice of the Office for the rectification of such imperfections or defects in the application of which applicant does not avail himself.

The decision of the Examiners-in-Chief is affirmed.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Southern District of New York.

THE EDISON ELECTRIC LIGHT COMPANY *v.* UNITED STATES ELECTRIC LIGHTING COMPANY.

1. EDISON—DYNAMO-ELECTRIC MACHINE.
   Letters Patent No. 263,140, granted August 22, 1882, to Thomas A. Edison, for improvements in dynamo-electric machines, expired with the expiration of the Austro-Hungarian patent for the same invention.
2. ON PLEA.
   The defendant pleaded that it should not be called upon to answer, because by reason of the expiration of a foreign patent for the same invention the patent in suit had expired, and the complainant had a plain, adequate, and complete remedy at law, and the court should not take cognizance in equity of the suit. The complainant contended that such a defense could not be raised by plea, and if it could, that the plea was insufficient both in matters of form and substance to present such a defense.
3. PLEA TO JURISDICTION PROPER.
   A plea to the jurisdiction is proper both in suits at law and in equity.
4. PLEA GOOD EVEN IF PARTLY OR WHOLLY NEGATIVE.
   It is no objection that such a plea is partly a negative and partly an affirmative plea, or indeed negative wholly.
5. PLEA—THE EFFECT OF.
   The effect of the plea is to admit all the facts alleged in the bill except those specifically denied, and to meet the case made by the bill by alleging the new facts intended to show the expiration of the patent in suit.
6. PLEA—WHEN SUFFICIENT.
   A plea is sufficient which sets forth documents according to their tenor or legal effect, and avers the substantive facts relied upon.
7. PLEA—PROOFS WHEN ISSUE IS TAKEN ON IT.
   If issue were taken on the plea, it would only be necessary for defendant to produce a properly authenticated copy of the foreign patent, and show the seal or signature affixed to it to be the act of an officer duly authorized to issue patents.

8. PLEA—THE EFFECT OF—HOW DETERMINED.
   The effect and operation of the patent is to be determined as a question of law by the terms of the document, unless evidence of the foreign law is introduced to qualify or controvert the construction which would otherwise be placed upon the instrument.
9. PLEA—WHAT ALLEGATION NECESSARY.
   It is not necessary in pleading to allege that an instrument was executed by an agent, and that the agent was duly qualified thereto; but it is sufficient to allege its execution by the principal.
10. PRESUMPTIONS ATTENDING FOREIGN OFFICIAL DOCUMENTS.
    The tribunals of every nation take judicial notice of the public seals of foreign States, and the annexation of the seal will be presumed to have been made by a person having custody thereof and competent to do the act.
11. SECTION 4887 REVISED STATUTES CONSTRUED.
    It is not material whether the foreign patent is granted to the inventor who made the application in this country or to some other person to whom he has caused the invention to be patented, nor that the inventor who makes the application here is one of our citizens.
12. STATUTES—HOW CONSTRUED.
    If there is no ambiguity in the statute, it is the duty of the court to give effect to its obvious meaning, without entering into any inquiry as to the supposed intention of Congress, notwithstanding the statute may be thought to make an unreasonable and harsh innovation.
13. SAME.
    Where the meaning of the Revised Statutes is plain, the court cannot look into the source of the revision to ascertain whether errors have or have not been committed by the reviser.
14. STATUTE 4887 CONSTRUED.
    A patent of the United States taken out by the inventor, a citizen of the United States, expires at the date of expiration of a foreign patent for the same invention previously taken out by the same inventor, or by his request, although the patent of the United States had been first applied for and the invention had been put in use in the United States before the foreign patent had been applied for.

Mr. John C. Tomlinson, Mr. Richard N. Dyer, Mr. William M. Evarts, and *Mr. Clarence A. Seward* for the plaintiff.

Mr. Samuel A. Duncan, Mr. Leonard E. Curtis, Mr. Frederic H. Betts, and *Mr. Edmund Wetmore* for the defendant.

WALLACE, *J.:*

The plea to the bill of complaint, which has been set down for argument, alleges in substance that the defendant should not be compelled to answer, because by reason of the facts averred in the plea the remedy of the complainant is plain, adequate, and complete at law, and this court should not take cognizance in equity of the suit.

The bill alleges the infringement by the defendant of Letters Patent of the United States No. 263,140, dated August 22, 1882, granted to the complainant upon the application of Edison, for an improvement in dynamo-electric machines, the invention of Edison. The bill shows that Edison made his application for a patent August 9, 1880, and assigned his title to the complainant June 21, 1881. Besides the averments usually contained in bills to restrain infringements of patents, allegations are introduced by way of anticipation of the supposed defense to the bill in order to meet any issue tendered by the defendants. These averments are in substance that the defendant may wrongfully pretend as an excuse for its wrongful acts in the premises that the complainant's Letters Patent are no longer in force or operative, because at the time they were granted the invention described therein had been first patented in the Austro-Hungarian Empire for the term of 1 year, and that such foreign patent has expired, and consequently the term of complainant's patent has expired; but that the facts are that Edison at the time of making the invention was, and always since has been, a resident and citizen of the United States, and made, perfected, and reduced the invention to practice in the United States, and made and filed his application for a patent in the United States Patent Office August 9, 1880, and prior to any application made by him abroad, and that in order to protect his invention in foreign countries it was necessary that he should promptly apply for Letters Patent abroad, and the issue of the foreign patent preceded the United States patent solely because of the greater diligence and more prompt procedure of the foreign administration.

The bill further avers that the Letters Patent of the Austro-Hungarian Empire were granted for the term of 15 years from their date and are in full force and effect.

The plea alleges that prior to the granting of the complainant's Letters Patent the invention or discovery described and claimed therein had been patented by Edison, or with his knowledge, consent, and procurement, by a public patent of the Austro-Hungarian Empire, granted to Edison, July 21, 1881; that the term for which the foreign patent was granted was 1 year from its date, and expired on the 21st day of July, 1882; that subsequently, by grant made on the 19th day of July, 1882, the foreign patent was extended for a new term of 1 year, and the extended term expired on the 21st day of July, 1883, and that the extended Austro-Hungarian patent was existing and unexpired when the complainant's Letters Patent were granted, but the term thereof expired July 21, 1883, and before the commencement of this suit. The plea denies the averments of the bill that the Austro-Hungarian patent was granted for the term of 15 years, and was in full force and effect when this suit was brought.

If the complainant's patent had expired before the bringing of this suit, it is plain that a court of equity has no jurisdiction of the cause of action for infringement, and the complainant can only proceed by a suit at law for the recovery of damages. (*Root* v. *Railway Co.*, 105 U. S. 189.) It is contended for the complainant that such a defense cannot be raised by a plea, and if it could that the present plea is insufficient both in matters of form and substance to present such a defense.

One of the uses of a plea in suits at law or in chancery is to object to the jurisdiction of the court. (*Livingston* v. *Story*, 11 Pet., 351; *Wickliffe* v. *Owing*, 17 Howd., 47, 51.) In a case where it was urged that the sum involved was not of sufficient amount to authorize a court of chancery to take cognizance of the cause, Chancellor Walworth said:

> If that fact did not appear upon the face of the bill, it might undoubtedly have been pleaded in bar of relief. (*Smets* v. *Williams*, 4 Paige, 364.)

In Beames on Pleas, 55, it is stated:

> Those pleas which are commonly called "pleas to jurisdiction" do not proceed the length of disputing the right of a plaintiff in the subject of the suit, or allege any disability on the part of the plaintiff to prosecute the suit, but simply assert that a court of chancery is not the proper court to take cognizance of those rights.

The present plea falls within this definition.

There is no force in the objection that the plea is a negative plea. Such pleas are sanctioned and are now frequently resorted to. A familiar instance is a plea denying partnership where the bill prays an account of partnership transactions. The present plea is not strictly a negative plea. It is a negative plea so far as it denies the averments of the bill that the term of the Austro-Hungarian patent is for 15 years, and that the patent was in full force when the suit was brought. It is an affirmative plea as to all the other facts which it sets forth. The effect of the plea is to admit all the facts alleged in the bill except those specifically denied, and to meet the case made by the bill by alleging the new facts intended to show that the complainant's patent had expired at the time of the commencement of the suit. If the bill did not contain the anticipatory averments which have been inserted in it, the denial in the plea would have been unnecessary. With this denial in the plea it is only necessary to inquire whether the facts set up affirmatively are a defense to the suit, admitting that everything in the bill not denied is true.

A pleading is sufficient which sets forth documents according to their tenor or legal effect, and avers the substantive facts relied on as a cause of action or defense. Tested by this rule, the plea is sufficient in form without making a profert of the Austro-Hungarian patent, or setting out in detail any of the evidential facts to show that it was a valid grant of Letters Patent for the invention for the term of 1 year. If issue were taken on the plea, it would only be necessary for the defendant to produce a properly-authenticated copy of the foreign patent and show the seal or signature affixed to it to be the act of an officer duly authorized to issue patents. The effect and operation of the patent is to be determined as a question of law by the terms of the document, unless evidence of the foreign law is introduced to qualify or controvert the construction which would otherwise be placed upon the instrument. It is not necessary in a pleading to allege that an instrument was executed by an agent and that the agent was duly authorized thereto. It is sufficient to allege its execution by the principal. (*Delafield* v. *Kinney*, 24 Wend., 345.) The tribunals of every nation take judicial notice of the public seals of sovereign states, (1 Greenleaf Ev., sec. 4,) and the annexation of the seal will be presumed to have been made by a person having custody thereof and competent to do the act. (Phillips Ev., 419.)

The plea sets forth a sufficient defense if the term of a United States patent ends at the same time the term of a foreign patent granted for the same invention ends, when it appears that the foreign patent was not applied for until after the domestic patent was applied for; that it was not applied for by the inventor himself, but by some other person by his procurement, and that the domestic patent was granted to one who at the time of the application was an American citizen and had made and reduced his invention to practice in this country. The question presented depends upon the meaning and effect of section 4887 United States Revised Statutes, which is as follows:

> No person shall be debarred from receiving a patent for his invention or discovery, nor shall any patent be declared invalid by reason of its having been first patented or caused to be patented in a foreign country, unless the same has been introduced into public use in the United States for more than two years prior to the application. But every patent granted for an invention which has been previously patented in a foreign country shall be so limited as to expire at the same time with the foreign patent, or, if there be more than one, at the same time with the one having the shortest term, and in no case shall it be in force more than seventeen years.

It is not at all material whether the foreign patent is granted to the inventor who makes the application in this country or to some other person to whom he has caused the invention to be patented. The statute expressly covers both cases. Nor is the fact of any importance that the inventor who makes the application in this country is one of our own citizens, because since the act of July 4, 1836, which repealed all former patent laws and established a comprehensive code covering the whole subject our laws have not made any distinction between our own citizens and foreigners in respect to the privilege of obtaining patents or the conditions and restrictions of the privilege granted, except as to the amount of the fee to be paid and the protection of inventions by caveat. The question may therefore be simplified by eliminating these immaterial ingredients; and the real inquiry is whether the section limits the term of a domestic patent to the term of a foreign patent when the application for the foreign patent is not made until subsequent to the application in this country but the foreign patent issues before the domestic patent.

If it were proper to treat this question as an original one, it would be necessary first to inquire whether there is any ambiguity in the language of the statute. If there is not, the duty of the court is to give effect to its obvious meaning, notwithstanding it may be thought to make an unreasonable and harsh innovation upon the pre-existing privileges of our own inventors. It is not only the safer course to adhere to the words of a statute construed in their ordinary import instead of entering into any inquiry as to the supposed intention of Congress, but it is the imperative duty of the court to do so. Where the meaning of the Revised Statutes is plain, the court cannot look to the sources of the revision to ascertain whether errors have or have not been committed by the revisers. (*United States* v. *Boyd*, 100 U. S., 508.)

There is no practical difference in the phraseology of section 4887 and that of section 25 of the act of July 8, 1870, from which the section is reproduced. The precise point now raised by the complainant, but made with reference to the effect of section 25 of the act of 1870, was considered by this court in *The Gramme Electrical Co.* v. *The Arnoux & Hochhausen Electric Co.*, (21 Blatch., 360.) It was insisted by the defendant in that case that the complainant's patent expired at the date of the expiration of an Austrian patent, and the complainant took the position that the defense was not tenable because the application for his United States patent was filed before the application for the Austrian patent was made. It was held by Judge Blatchford that the date of the application for the United States patent could not affect the question, and that the meaning of the statute was that the United States patent should expire at the time of expiration of the foreign patent, irrespective of the time when the foreign patent was applied for. Judge Blatchford adopted in that case the views of Judge Nixon upon the same question in *Bate Refrigerating Co.* v. *Gillett*, (13 Fed. Rep., 553.) In the Bate case the question arose under section 4887, and it was contended that complainant's United States patent did not expire at the date of the expiration of a Canadian patent, because the application for his patent was filed antecedent to the application for the grant of the Canadian patent. The court was of the opinion that it would be wresting the language of the section from its plain and obvious meaning to sustain that position. These decisions have been followed by Judge Bradley upon a subsequent hearing in the Bate case, and by Judge Colt in *Bate Co.* v. *Hammond*, (First Circuit U. S.)

In view of these adjudications the question should not be considered as an original one. The plea is therefore allowed.

Fraudulent Practices by Attorneys.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 16, 1888.

The attention of this Office having frequently been called to circulars and communications of persons pretending to have access to the records of this Bureau, and claiming to possess information of the pendency of applications for patents, notice is hereby given the public that all such persons in so advertising themselves are acting under false representations and are guilty of unprofessional conduct, and should not be entitled to credit.

The Office has also received information that certain attorneys disbarred from practice under section 483 of the Revised Statutes are continuing to prosecute applications for patents under the names of other persons.

Hereafter a list will be published in the OFFICIAL GAZETTE containing the names and addresses of all such persons, and the public warned against employing them or intrusting applications or interests to their charge.

BENTON J. HALL, *Commissioner.*

The Office has information that *James S. McGahan, No. 125 Broadway, New York*, a disbarred attorney, has been practicing under the name of *Alexander Mahada*.

Publishers' Catalogues.

This Office would be pleased to receive from manufacturers and publishers such catalogues, circulars, price-lists, or other advertisements relating to the sciences and mechanical arts as are published by them for gratuitous distribution; but notice is hereby given such manufacturers or dealers who feel disposed to send their publications that not less than three copies should be forwarded in order that the subjects may be properly indexed, classified, and subdivided in the Scientific Library for convenient and ready reference.

Notice.

UNITED STATES PATENT OFFICE,
Washington, D. C., April 13, 1888.

To expedite the distribution of the mail in this Office, and to insure the prompt and certain delivery of communications to the divisions and officials having charge of the matters to which they relate, attorneys and correspondents are respectfully requested to enter upon the upper left-hand corner of envelopes and other communications addressed to them, the number of the room and the name of the particular officer or designation of the division to which the communication should be sent.

BENTON J. HALL,
Commissioner of Patents.

Issue of June 26, 1888.

DESIGNS.

18,407.—BADGE.—*Eugene A. Crawford*, Pawtucket, R. I. Application filed May 15, 1888. Serial No. 274,001. Term of patent 7 years.

18,408.—CARPET-SWEEPER CASING.—*Walter J. Drew*, Grand Rapids, Mich., assignor to *The Bissell Carpet Sweeper Company*, same place. Application filed February 23, 1888. Serial No. 265,052. Term of patent 14 years.

18,409.—EDUCATIONAL MODEL.—*Ulysses Grant Houston*, Manhattan, Kans. Application filed April 28, 1888. Serial No. 272,214. Term of patent 14 years.

18,410.—PEN AND PENCIL CASE.—*Thomas Richards*, Jersey City, N. J. Application filed March 27, 1888. Serial No. 268,676. Term of patent 7 years.

18,411 and 18,412.—ORNAMENTATION OF GAME-TABLETS.—*J. Walter Spalding*, New York, N. Y., assignor to *A. G. Spalding & Brothers*, Chicago, Ill. Applications filed January 12, 1888. Serial Nos. 260,578 and 260,580. Term of patents 7 years.

18,413.—BURIAL-CASKET.—*Leo Stein*, Rochester, N. Y., assignor to *The Stein Manufacturing Co.*, same place. Application filed December 19, 1887. Serial No. 258,416. Term of patent 14 years.

18,414.—BACK OF ENVELOPES.—*Jonathan Stern*, Savannah, Ga. Application filed May 28, 1888. Serial No. 274,841. Term of patent 7 years.

18,415.—QUILTING.—*Charles T. Wagner*, College Point, N. Y. Application filed January 31, 1888. Serial No. 262,560. Term of patent 7 years.

18,416.—QUILTING.—*Charles T. Wagner*, College Point, N. Y. Application filed February 2, 1888. Serial No. 262,831. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

15,626.—TONIC MEDICINE.—*James M. Alloways*, Indianapolis, Ind. Application filed May 2, 1888. Used since October, 1887.
"The word 'A. F. A. C. T.'"

15,627.—GLUCOSE, GRAPE-SUGAR, AND CORN-SIRUP.—*The American Glucose Company*, Buffalo, New York; Leavenworth, Kans.; Iowa City, Iowa; Peoria, Ill., and Tippecanoe City, Ohio. Application filed April 14, 1888. Used since March, 1888.
"The representation of a triangle."

15,628.—TONIC MEDICINE.—*Henry Ballantine*, New York, N. Y. Application filed March 10, 1888. Used since August 12, 1887.
"The word 'KORITZA.'"

15,629.—SOLUBLE COCOA.—*Bensdorp & Co.*, Amsterdam, Netherlands. Application filed May 8, 1888. Used since November 16, 1881.
"The words 'BENSDORP & Co., ROYAL DUTCH PURE SOLUBLE COCOA,' in combination with a scene representing registrants' factory and ware-rooms at Amsterdam."

15,630.—EYE-WATER.—*Elizabeth BiEsland*, New York, N. Y. Application filed March 22, 1886. Used since July, 1880.
"The words 'POOR RICHARD'S EYE-WATER.'"

15,631.—EXTRACTS, PERFUMES, OILS, AND SOAPS.—*Bloomingdale & Levy*, New York, N. Y. Application filed April 24, 1888. Used since April 1, 1888.
"The words 'HEARTS EASE.'"

15,632.—EXTRACTS, PERFUMES, OILS, AND SOAPS.—*Bloomingdale & Levy*, New York, N. Y. Application filed April 24, 1888. Used since April 1, 1888.
"The words 'FLOWER DE LUCE.'"

15,633.—EXTRACTS, PERFUMES, OILS, AND SOAPS.—*Bloomingdale & Levy*, New York, N. Y. Application filed April 24, 1888. Used since April 1, 1888.
"The words 'RED LETTER' and the name of the odor and contents of the vessel in red letters."

15,634.—BEER.—*Cramer & Kersten*, Charleston, S. C. Application filed May 3, 1888. Used since April 21, 1888.
"The representation of a palmetto-tree and the monogram 'C & K.'"

15,635.—WATER-CLOSET PAPER.—*H. S. Crocker & Co.*, San Francisco, Cal. Application filed May 9, 1888. Used since March 1, 1888.
"The word 'COSMOPOLITAN.'"

15,636.—BLOTTING-PAPER IN SHEETS AND PADS.—*H. S. Crocker & Co.*, San Francisco, Cal. Application filed May 9, 1888. Used since May 1, 1888.
"The word 'ELECTRIC.'"

15,637.—WATER-CLOSET PAPER.—*H. S. Crocker & Co.*, San Francisco, Cal. Application filed May 9, 1888. Used since March 1, 1888.
"A pictorial scene of the Golden Gate or entrance to the Bay of San Francisco and the words 'TAMALPAIS MILLS.'"

15,638.—MEDICINAL PREPARATION FOR UTERINE DISEASES.—*Dies Chemical Company*, St. Louis, Mo. Application filed May 8, 1888. Used since April 6, 1888.
"The word 'DIOVIBURNIA.'"

15,639.—MEDICATED FOOD FOR ANIMALS.—*F. E. Sunborn*, Omaha, Nebr. Application filed April 20, 1888. Used since July 1, 1886.
"A farm-scene comprising a barn, a group of three horses, four cows or cattle, two sheep, and two swine, and some fowls, with a male and female figure in the left foreground, and also boxes labeled 'STANDARD HOMINY & CATTLE FOOD.'"

15,640.—INDIAN BLOOD REMEDY.—*Henry H. Hopkins*, Hillsdale, Mich. Application filed May 18, 1888. Used since the year 1883.
"The likeness of the registrant 'HENRY H. HOPKINS.'"

15,641.—COAL AND COKE.—*Jumbo Coal and Coke Co.*, Pittsburg, Pa. Application filed May 22, 1888. Used since September, 1884.
"The word 'JUMBO.'"

15,642.—METAL ARTICLES FOR DECORATION AND FOR TOILET AND TABLE USE.—*Watson J. Miller* and *Henry Berry*, Shelton, Conn. Application filed May 9, 1888. Used since April 20, 1888.
"The letters and character 'M & B' with the word 'SMALLING.'"

15,643.—WASHING-MACHINES.—*Recknagel & Co.*, New York, N. Y. Application filed May 18, 1888. Used since May 10, 1888.
"The word 'CATARACT.'"

15,644.—LIQUID POLISH FOR STOVES.—*Isaac H. Reddic*, Boston, Mass. Application filed March 20, 1888. Used since September 7, 1887.
"The word-symbol 'THE SILVER COMET.'"

15,645.—LARD.—*Rohe & Brother*, New York, N. Y. Application filed May 18, 1888. Used since January 1, 1882.
"The word 'UNION.'"

15,646.—BEER.—*Joseph Schlitz Brewing Company*, Milwaukee, Wis. Application filed May 19, 1888. Used since May 1, 1888.
"A representation of the globe of the world with a belt or band about it secured by a buckle."

15,647.—VINEGAR.—*Thal & Howe*, St. Louis, Mo. Application filed May 3, 1888. Used since February, 1888.
"A Maltese cross in red and inclosed in a bronzed frame and bronze center-piece, with four arms reaching to the four corners of said frame, with the words 'TRADE-MARK' crosswise of the bronze circle."

15,648.—CLOTHES-PINS.—*Tobyhanna and Lehigh Lumber Company*, Tobyhanna Mills, Pa. Application filed May 3, 1888. Used since May 1, 1885.
"The word 'TOBYHANNA.'"

LABELS.

5,635.—Title: "CLOSSON'S GERMAN DYSPEPSIA PANACEA."—*W. E. Closson*, Independence, Iowa. Application filed June 2, 1888.

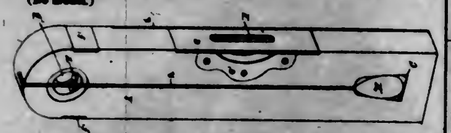
5,636.—Title: "BLACKBERRY AND PEPPERMINT CORDIAL."—*Joseph Jacobs*, Atlanta, Ga. Application filed May 28, 1888.

5,637.—Title: "SWEET GUM AND HONEY."—*Joseph Jacobs*, Atlanta, Ga. Application filed May 28, 1888.

5,638.—Title: "FRAGRANT COLOGNE."—*Joseph Jacobs*, Atlanta, Ga. Application filed May 28, 1888.

5,639.—Title: "DR. MARTIN'S HEALTH RESTORER AND BLOOD PURIFIER."—*Horace J. Martin*, Washington, D. C. Application filed May 28, 1888.

5,640.—Title: "DR. BUTTON'S COFFEE."—*James H. Myers*, Norwich, Conn. Application filed May 31, 1888.



5,641.—Title: "NATIONAL DEMOCRATIC BADGE 1888 PRESIDENTIAL CAMPAIGN."—*Reynolds Jewelry Co.*, Providence, R. I. Application filed June 4, 1888.

5,642.—Title: "CLOVER BLOSSOM COMPOUND" (FOR A BLOOD PURIFYING MEDICINE.)—*Wilbur H. Selleck*, Williamstown, N. Y. Application filed May 28, 1888.

PATENTS

GRANTED JUNE 26, 1888.

384,951. COMBINED RULE, LEVEL, AND PLUMB. CHARLES ANDES, Terre Haute, Ind. Filed Feb. 21, 1888. Serial No. 264,743. (No model.)

Claim.—The herein-described combination-tool, comprising the body A, having flat side edges and the openings B and C, respectively, near its opposite ends, and provided with the central plumb-marks, D, extending between said openings on each side, the longitudinal level E, inserted in one edge of its body and held in place by the socket-plates *e f*, the former being set flush in the edge of the body, while the latter is set flush in the side of the body, the transverse level F, passing through the circular opening B and retained in place in its socket by the metal plates *f'*, set flush in the corresponding side edges of the body, the scales G G', set flush in the side of the body opposite that carrying the socket-plate *e'*, the said scales being of metal, a foot long, each graduated in opposite directions to inches and sixteenths of an inch, and situated adjoining opposite edges of the side of the body, the line A, having one end secured centrally to the end of the body adjacent to the opening B, and the plumb-bob on the end of said line, substantially as specified.

384,952. PLOW. LORENZO D. BALL and JOHN T. BARNES, Canton, Ohio. Filed Feb. 15, 1888. Serial No. 264,004. (No model.)

Claim.—1. The combination of the beam B, provided with the flange *d* and recess *d'*, said flange *d* being formed integral with the beam B, the screw-head H, provided with the collar or flange A, the screw I, provided with the eye *e*, the bolt *f*, and the beam E, pivotally attached to the beam B, substantially as and for the purpose specified.

2. The combination of the beam B, the beam E, having the arms or bars *b b*, the disks J, provided with the lugs K, the draft-bar G, the clamping-bolt *c*, and means for adjusting the beam E, substantially as and for the purpose specified.

384,953. SALT-DRIER. C. TALLEYRAND BARCLAY, Warsaw, N. Y. Filed Apr. 11, 1887. Serial No. 234,376. (No model.)

Claim.—1. A metallic drying-cylinder and mechanism to rotate the same, a lining for said cylinder consisting of wooden staves held in contact with the inner surface of said cylinder, interior rings for retaining said staves in position, and a heating-drum passing longitudinally through the cylinder, all in combination substantially as described.

2. The combination, with a drying-cylinder, of a wooden lining consisting of staves and expansible hoops lying in contact with the interior surface of the staves, substantially as described.

3. The combination, with a metallic drying-cylinder, of a wooden lining consisting of staves lying in proximity to the inner surface of the cylinder, and divided wooden rings in contact with the staves, said rings expansible by means of a wedge between the proximate ends, substantially as described.

4. The combination, with the inner surface of a drying-cylinder having a wooden lining, of a series of expansible wooden rings having beveled edges, substantially as described.

5. The combination, with the metallic cylinder and staves, of a sectional wooden ring bearing against said staves, said ring having a slot through its proximate ends and a wedge lying in said slot, as set forth.

6. The combination, with the metallic drying-cylinder, the wooden lining for the same, and the interior hoops having expanding mechanism, substantially as described, and having elongated perforations therethrough, of bolts passing through the holes in the hoops, staves, and cylinder, substantially as described.

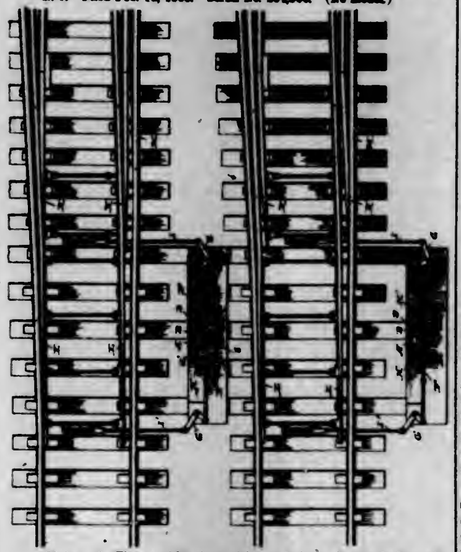
384,954. INSIDE BLIND. EDMAN A. BENEDICT, Syracuse, N. Y., assignor of one-half to George I. Beach, same place. Filed Sept. 19, 1887. Serial No. 249,955. (No model.)

Claim.—1. A sheet for the purposes specified, consisting of a series of pulp boards or layers glued or cemented together, and provided with a metal binding-rod secured thereto, and a wooden strip or binding mounted on the rod, substantially as specified.

2. An inside blind composed of pulp board, a metal binding-rod secured to the edge thereof by a flexible strip, and a wooden binding-strip grooved and adapted to receive said rod, substantially as specified.

3. An inside blind composed of layers of pulp board cemented together, a metal binding-rod secured thereto by a flexible strip, a wooden binding-strip grooved to receive said rod, and a layer of veneer, paper, or other imitation, secured to surface of the blind, substantially as specified.

4. An inside blind formed of layers of pulp board glued together, cut out, and provided with a wooden block, in combination with a hinge secured to said block and to the inside casing of the window, substantially as specified.



5. An inside blind formed of layers of pulp board cemented together, a binding-rod of metal secured in place by a flexible strip, and a wooden binding-strip grooved and embracing said rod, in combination

with a hinge formed with a sleeve and a set-screw, and a window-casing having a rod adapted to be received by said sleeve, substantially as specified.

6. The combination of the layers B', cemented together, cut out, and provided with the blocks F^3, with the hinge E, comprising the members E' E^2, the member E^2 being perforated and connected to the block and formed with a knee, E^3, and the member K being provided with the sleeve E^4, having the set-screw E^5, the casing A, and the rod G, substantially as specified.

7. The combination of the layers B', cemented together, the veneer F, the binding-rod C, its strip C', the binding-strip D, the hinge E, casing A, and rod G, substantially as specified.

384,955. RAILWAY-SWITCH. LOUIS BLACKSTONE, Jersey City, N. J. Filed Feb. 14, 1888. Serial No. 264,506. (No model.)

Claim.—1. The combination, with two independent switches, of a movable cam engaging in succession with the shifting connections of the two switches to move them separately and successively, substantially as described.

2. The combination, with two independent switches and their shifting connections, of a cam, with which engage in succession projections carried, respectively, by the shifting connections of the switches, and a handle for moving the cam, substantially as described.

3. In a three-way switch, the combination of the switch-rails K and L, the slide-bars F F', each carrying a projection, movable connections between the said bars and the switch-rails, respectively, a plate provided with one or more cam-edges, with which said projections engage, and a handle for turning the plate, substantially as described.

4. In a three-way switch, the combination of the switch-rails K and L, the slide-bars F F', connected, respectively, therewith, and each provided with a projection, a cam-plate provided with a cam, D, with which said projections engage, said cam having a portion, *d*, substantially concentric with the pivot of the plate, and another portion, *d'*, situated at a distance from the pivot greater than the distance of the portion *d* therefrom, substantially as described.

5. In a three-way switch, the combination of the switch-rails K and L, the slide-bars F and F', connected, respectively, therewith, and provided with the studs E and E', respectively, the horizontally-arranged plate A, having formed therein the groove D, having the two portions *d* and *d'*, the shaft upon which the plate is mounted, and the handle, substantially as described.

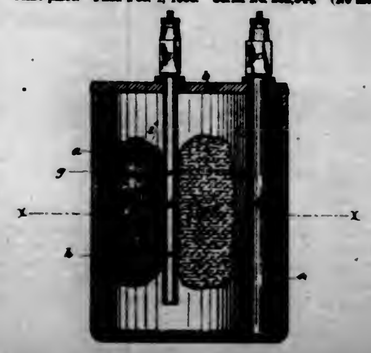
384,956. DEVICE FOR MAKING PLUMBERS' TRAPS. AUGUST BELL, Berlin, Germany, assignor to Edward Strong Turvey, same place. Filed Sept. 21, 1887. Serial No. 250,278. (No model.)

Claim.—1. In a device for making water traps and bends, sheathing or covering the surfaces of the slide or diaphragm or die with an anti-friction metal, substantially as described in the foregoing specification, and shown in the accompanying drawings.

2. In a device for making water traps and bends, the combination of the sheathed slide *c* with the connecting-rails *g*, shaft *k*, journals *i*, and lever *m*, substantially as described in the foregoing specification, and shown in the accompanying drawings.

3. In a device for making water traps and bends, the device for operating the slide or diaphragm *c*, characterized by the base-plate *a*, connecting-rails *g*, journals *i*, bearings *l*, lever *m*, and shaft *k*, substantially as described in the foregoing specification, and shown in the accompanying drawings.

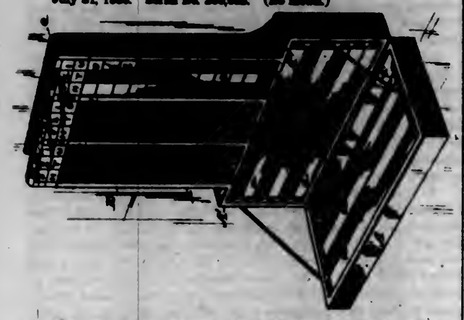
384,957. HAY-CAP. JAMES BRADY, Sparta, Ill. Filed Mar. 30, 1887. Serial No. 233,057. (No model.)



Claim.—1. A hay-cap comprising a section or sections of roofing bent to form inclined sides, said section constituting the apex of the cap and having the side edges provided with vertical flanges to allow lateral attachment of other similar sections thereto, substantially as described.

2. A hay-cap comprising a section of roofing bent to form inclined sides, said section constituting the apex of the cap and having the side edges vertically flanged to permit lateral attachment thereto of other like sections, and the lower edges overlapping other plain flat sections attached to the lower edge of the first section, the side edge of said plain flat sections being also provided with vertical flanges to permit the lateral attachment of like sections, substantially as described.

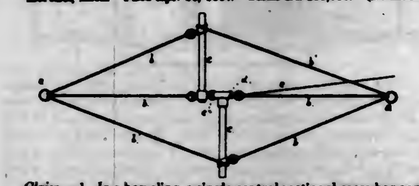
3. A hay-cap comprising a section of roofing bent to form inclined sides, said section constituting the apex of the cap and having side edges vertically flanged to permit lateral attachment of other like sections, and lower edges overlapping other plain flat sections attached to the lower edge of the first section, the side edges also being provided with vertical flanges to permit the lateral attachment of like sections, and an inclosing-cap to fit over the lateral flanges of the sections, substantially as described.



4. A hay-cap comprising a section of roofing bent to form inclined sides, said section constituting the apex of the cap and having side edges vertically flanged to permit lateral attachment of other like sections, and lower edges overlapping other plain flat sections attached to the lower edge of the first section, the cap and the said flat sections being secured together by means of hooks, nuts, and bolts, staples, or the like passed through the overlapping portions of the cap and flat sections, and an inclosing-cap to fit over the lateral flanges of the sections, substantially as described.

384,958. GALVANIC BATTERY. CHARLES A. BROWN and MARTIN M. CLARK, Chicago, Ill., assignors to the Western Electric Company, same place. Filed Feb. 1, 1888. Serial No. 262,644. (No model.)

Claim.—The combination, with the negative element of a galvanic battery, of two bags containing a mixture of carbon and peroxide of manganese, said bags being secured to opposite sides of said negative element, substantially as described.



384,959. APPARATUS TO FACILITATE THE TEACHING OF NOTATION AND NUMERATION. WILLIAM R. GARD, Corbon, Ind. Filed July 31, 1882. Serial No. 269,662. (No model.)

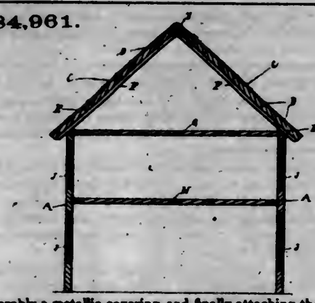
Claim.—1. In an apparatus for facilitating the teaching of notation and numeration, the frame E, divided into sections, as shown, and adapted to receive and display the tablets *a a a*, in combination with the rotary base-blocks *c*, having slots *d'*, and set-screws d^2, substantially as shown and described.

2. In an apparatus for facilitating the teaching of notation and numeration, the frame E, having head-board C, provided with inscriptions thereon, in combination with the tablets *a a a*, having letters and figures thereon, the rotary base-blocks *c*, having slots *d'*, and set-screws d^2, all arranged and operated substantially as shown and described.

384,960. HAY-SLING. ANDREW CHURCH and CHARLES A. CHURCH, Harvest, Mich. Filed Apr. 16, 1887. Serial No. 235,089. (No model.)

Claim.—1. In a hay-sling, a single central sectional cross-bar composed of two sections meeting centrally of the sling, in combination with a trip-lock uniting the adjacent ends of said two sections, which sections, when said lock is tripped, become disconnected and fall apart, substantially as shown and described, for the purpose specified.

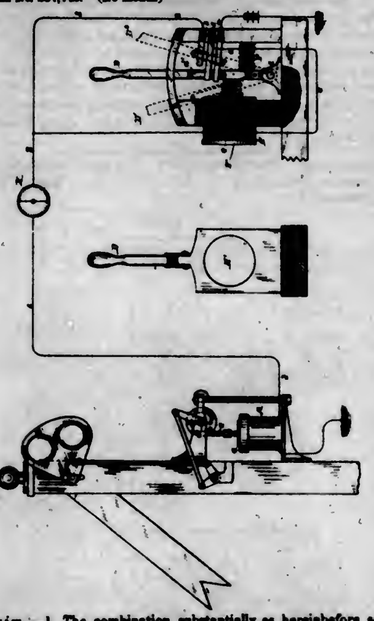
2. In a hay-sling, ropes *b*, ropes *b'*, terminating in a loop, respectively, and sectional cross-bar *c c'*, in combination with a trip-lock, substantially as shown and described, for the purpose specified.



3. In a hay-sling, trip-lock *d*, provided with oscillating bolt *f*, sliding stop *i*, and spring *l*, in combination with sectional cross-bar *c c'*, substantially as shown and described, for the purpose specified.

384,961. ROOF. REUBEN J. CLAFLIN, Edgerwood, Dak. Filed Mar. 24, 1888. Serial No. 268,497. (No model.)

Claim.—In the construction of buildings, the method herein described, which consists in raising the walls to the desired altitude, then superposing upon them a suitable ridge-pole and joists having



384,961.

preferably a metallic covering, and finally attaching the roof-covering under the said ridge-pole and joists, for the purpose set forth.

384,962. ELECTRIC RAILWAY-SIGNAL. STANLEY G. C. CURRIE, London, County of Middlesex, England, assignor to the Currie-Timmis Electric and Railway Supply Company, (Limited.) Filed May 10, 1887. Serial No. 237,749. (No model.)

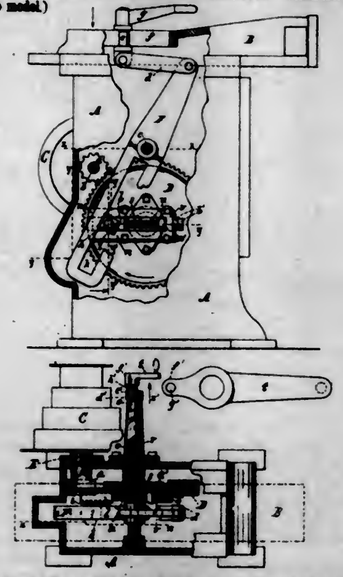
Claim.—1. The combination, substantially as hereinbefore set forth, of an electric railway-signal, its actuating-magnet and armature, its normally-open controlling-circuit, a shifting-lever making and breaking this circuit, and an indicator permanently connected with the switch-operating magnet in the controlling-circuit, whereby the indicator is actuated by a momentary return or reactionary current created by the contact of the signal-actuating magnet and its armature.

2. The combination, substantially as hereinbefore set forth, of the signal-actuating magnet, its controlling-circuit, the shifting-lever which makes and breaks this circuit, a high-resistance magnet in a shunt-circuit, and circuit-connections operated by the lever, all operating substantially as set forth—first to energize the signal-magnet, when the lever is pulled back, with the full current, short-circuiting the resistance, and then holding the shifting-lever in an intermediate position by the resistance-magnet, which is cut in as the shifting-lever is advanced.

3. The combination, substantially as hereinbefore set forth, of the signal-controlling circuit, the shifting-lever which makes and breaks it, the high-resistance magnet, which holds the shifting-lever in its intermediate position, and a tension-spring opposing the pull of the magnet automatically to restore the shifting-lever to its normal position when the current stops.

4. The combination, substantially as hereinbefore set forth, of the

shifting-lever, the resistance-magnet, its spindle, and its encircling-spring interposed between the lever and magnet to keep the armature and magnet in contact and ready to act on the lever.



5. The combination, substantially as hereinbefore set forth, of the signal-controlling circuit, its contacts, the shifting-lever, the high-resistance magnet in the shunt-circuit, its protruding armature-spindle, and encircling-spring to keep the magnet-armature in position to act promptly against the shifting-lever when the latter completes the shunt-circuit by its forward movement.

6. The combination, substantially as hereinbefore set forth, of the signal-controlling circuit, its contacts, the shifting-lever, its forward-thrusting spring F, the high-resistance magnet in a shunt-circuit, its protruding armature-spindle, and encircling-spring automatically to throw forward the lever and separate the resistance armature and magnet when the circuit is broken.

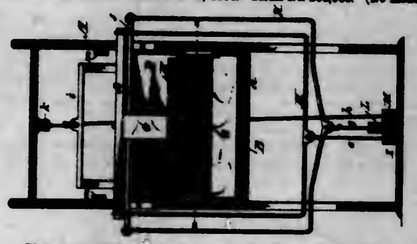
7. The hereinbefore-described automatically-retracting railway-signaling apparatus, consisting of the combination, substantially as hereinbefore set forth, of an electric railway-signal, its actuating-magnet in a controlling-circuit, a shifting-lever controlling said circuit, an indicator to show when the signal is set, a resistance-magnet shunted in by the shifting-lever to reduce the current while the signal is stationary, and an actuating-spring automatically shifting the lever to its normal condition when the circuit is broken and the signal reset.

8. The combination, substantially as hereinbefore set forth, of an electric circuit, a generator of electricity, an electro-magnet and its armature, its controlling-circuit, a railway-signal operated by the electro-magnet and armature, switch mechanism in the circuit for energizing the magnet, and an indicator in the same circuit with the magnet and permanently connected therewith, which indicates the return of the signal by means of the momentary return or reactionary current caused by the contact of the magnet-armature or short-circuiting of the field-magnet.

384,963. SHAPING-MACHINE. GEORGE W. DAVISON and JOHN BUCKLEY, Rochester, N. Y. Filed Oct. 17, 1887. Serial No. 252,613. (No model.)

Claim.—1. In combination with the vibrating lever of a shaping-machine, a driving-crank for said lever formed with an adjustable pin, a screw-shaft to move said adjustable pin of the crank, a bevel-gear and pinion to turn said screw-shaft, a shaft for said bevel-gear, and an actuating handle or crank for said shaft for the bevel-gear.

2. In combination with the vibrating lever of a shaping-machine, a driving wheel or crank for said lever, said wheel or crank being supported upon a hollow shaft and formed with an adjustable pin, a screw-shaft to move said adjustable pin of the crank, a gear and pinion to turn said screw-shaft, a shaft for said gear held within the bore of said hollow shaft, and an actuating-handle for said shaft for the gear.



3. In a shaping-machine, in combination with the vibrating lever, a driving-wheel for said lever provided with an adjustable pin and formed with a central opening or cavity, a screw-shaft to operate said adjustable pin, a pinion on said screw-shaft, a gear to turn said pinion, said gear occupying said cavity in the driving-wheel, a shaft for said gear, and an actuating-handle for said shaft.

4. In combination with the vibrating lever of a shaping-machine, a driving wheel or crank for said lever supported by a tapered hollow shaft, said wheel or crank having an adjustable pin, a screw-shaft to operate said adjustable pin, a pinion and gear to turn said screw-shaft, a shaft, *r*, for said gear held in the bore of said tapered shaft, an actuating-crank for said shaft *r*, a holder or bearing for said tapered shaft, and an adjustable collar for said tapered shaft held to bear against said holder for the tapered shaft.

5. In a shaping-machine, in combination with the vibrating lever, a driving wheel or crank for said lever having a hollow shaft and an adjustable pin, a screw-shaft to operate said adjustable pin, a pinion and gear to turn said screw-shaft, a shaft for said gear resting within said hollow shaft, a bearing or holder for said hollow shaft, a disk formed with a series of depressions secured to said hollow shaft, an actuating-handle for said shaft holding the gear, and a needle held by said handle to enter said depressions in the disk.

6. In a shaping-machine, in combination with the vibrating lever, a driving wheel or crank for said lever having a hollow shaft and an adjustable pin, a screw-shaft to operate said adjustable pin, a pinion and gear to turn said screw-shaft, a shaft for said gear resting within said hollow shaft, a bearing or holder for said hollow shaft, a disk formed with a series of depressions secured to said hollow shaft, an actuating-handle for said shaft holding the gear, a needle held by said handle to enter said depressions in the disk, and an actuating-spring to press said needle.

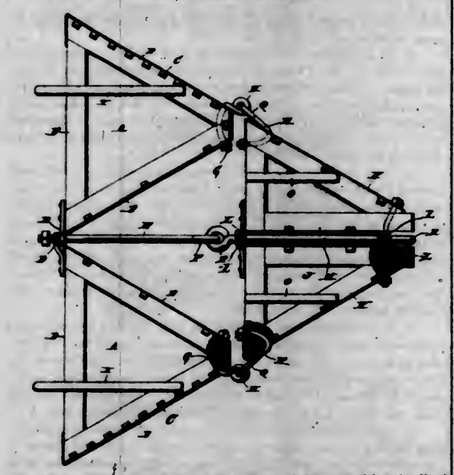
384,964. MACHINE FOR CUTTING DOUGH. ABRAHAM DAY, Moorefield, N. J. Filed Jan. 17, 1883. Serial No. 260,968. (No model.)

Claim.—1. The combination, with the frame, table, and dough-pan, of the guide-box, the cutters carried thereby, the plunger working in said box, the blocks carried by said plunger, the neck to said plunger extending through the top of the box, the yoke connecting with said neck, a treadle connected with the yoke, the long link *f*, connected to the top of the box and having an opening through which said neck loosely works, and a stop, *m*, on the frame for engaging said yoke and link, and a yoke and treadle connected with said link, substantially as described.

2. In a machine for cutting dough, the box D, carrying the cutter C, the plunger E, working in said box, and blocks F, carried by said plunger, in combination with the frame A, having openings *n* and cleats *m*, the yokes H K and ropes *e g h*, connecting with foot-treadles, bar *d*, connected with said plunger, and link *f*, connected to the top of the box and to which the yokes are attached, substantially as and for the purpose specified.

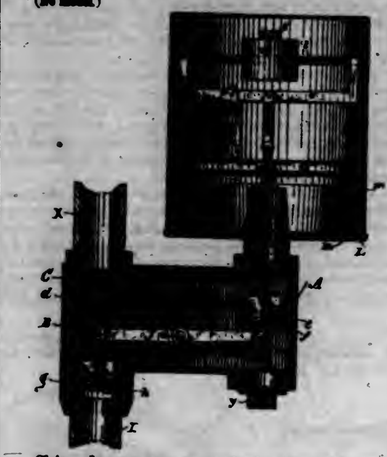
384,965. REFRIGERATOR. AVERY I. DEXTER, Whitewater, Wis. Filed Mar. 1, 1886. Serial No. 203,614. (No model.)

Claim.—1. In a refrigerator, the combination of an ice-chamber, one or more store-rooms or apartments located below said ice-chamber, and an exterior and interior non-conducting wall surrounding said store-rooms, and central or intermediate partition located between said exterior and interior walls, two cold-air spaces being formed thereby, surrounding said store-rooms, one of which cold-air spaces communicates from the lower part of said ice-chamber downward around and beneath the lower apartments, and the other communicates from the lower extremity of said lower apartment to the top of said ice-chamber, whereby exterior heat is excluded and said lower apartments are kept cold by the exclusion of heat without the admission of air from the ice-chamber, substantially as and for the purpose specified.



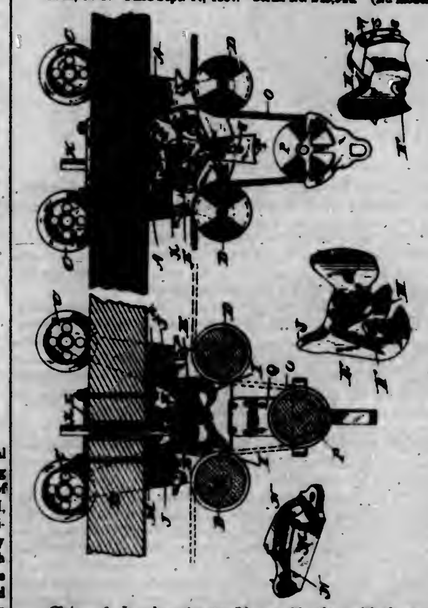
2. In a refrigerator having an ice-chamber and one or more store-rooms or apartments located below said ice-chamber surrounded by exterior and interior non-conducting walls, a central or intermediate partition located between said exterior and interior walls, forming cold-air spaces surrounding said store-rooms between said non-conducting walls, whereby said store-rooms are kept cold by the exclusion of exterior heat without admitting cold air from the ice-chamber, in combination with one or more freezing-tanks located in the upper part of said store-rooms and communicating therefrom with the ice-chamber,

384,965.



and water-pipes or ducts for conducting the overflow or water accumulating from the melted ice from said freezing-tanks to the exterior of the refrigerator, substantially as and for the purpose specified.

384,966. HARROW. JAMES W. DEXTER, West Lawn, Va. Filed Feb. 13, 1888. Serial No. 263,993. (No model.)



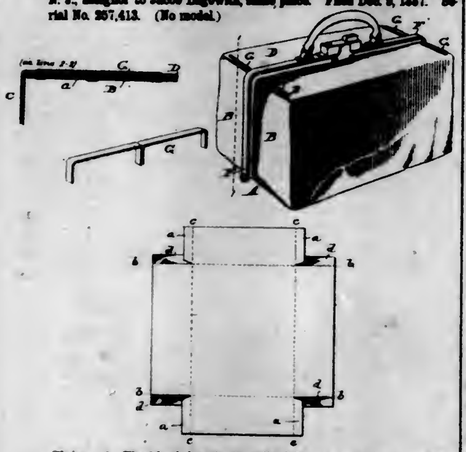
Claim.—The combination, in a harrow, of the central longitudinal draft-rod composed of the sections M and K, connected at their meeting ends by the hooks P and F, having a nut on the threaded rear end of the section F, and the draft-hook N at the front end of the section M, the two similar harrow-frames, K, having the shape of right-angled triangles with their right angles inward, connected to the section M by the eyes L, near the front and rear ends of said sections provided with suitable depending harrow-teeth, and on their upper surfaces with the weights O, and the similar triangular harrow-frames, A A, provided with suitable depending teeth, (connected to their side rails,) and a handle, I, rising from each at corresponding points, connected to the rear portion of the section F of the draw-bar by the eyes D, and to the outer rear corners of the harrow-frames K by the hooks Q, which have shanks R, passing through openings in said corners and engaging nuts on their inner threaded ends, and the hooks H, which have shanks G, passing through openings in the spines of the corresponding frames A and engaging nuts on their inner threaded ends, substantially as specified.

384,967. GAS PRESSURE-REGULATOR AND CUT-OFF. GEORGE S. FARLEIGH, Indianapolis, Ind. Filed Dec. 27, 1887. Serial No. 258,804. (No model.)

Claim.—In a gas pressure-regulator and cut-off, case A, having chamber B, provided with inlet-opening *g*, partition *d*, having opening *e*, and chamber C, having outlet X, cup L, mounted on said chamber C and having groove *m*, cup *o*, having rod *p* and valve *f* secured thereto, valves *f* and *h*, lever J, connecting said valves, lever *s*, pivoted to standard *r* and connected with rod *p*, and weight *z*, adjustably secured to lever *s*, all combined and arranged to co-operate in the manner and for the purpose specified.

384,968. HAY-CARRIER. GEORGE H. FOWLER, Tanghannock Falls, N. Y. Filed Sept. 17, 1887. Serial No. 249,944. (No model.)

Claim.—1. In a hay-elevator, the combination, with the carrier, of a pair of tripping-blocks pivotally secured therein, said blocks being similar to each other and each provided with wings, one of which is larger than the other and has its upper corner projecting upward, said wings being adapted to engage with each other, a plate adapted to be secured to the under side of the track having inclined faces, a locking-pin, and a hoisting-pulley, substantially as described.



2. In a hay-elevator, the combination, with the carrier, of a pair of tripping-blocks pivotally secured therein, said blocks being similar

to each other and each provided with wings, one of which is larger than the other and projects upward, and the smaller one projects downward, the small wing of each block engaging with the larger wing of the opposite block, a locking-block adapted to be secured to the under side of the track, a locking-pin, and a hoisting-pulley, substantially as described.

3. In a hay-elevator, the combination of the track, a plate secured to the upper side of the track, and a locking-plate secured to the under side of the track, said track, block, and plate being provided with a hole, a spring-actuated pin in the holes, a carrier, a pair of tripping-blocks pivotally secured in the carrier, the upper portions of which are square and adapted to engage with the lower end of the pin, and a hoisting-pulley, substantially as described.

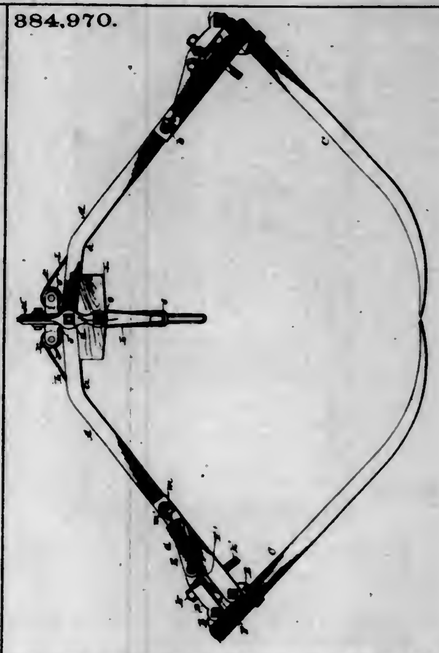
4. In a hoisting device, the combination of the track, the lock-block secured thereto, the locking-pin, the carrier, a pair of tripping-blocks in the carrier, each of which has a hook at its lower end and a tip at its upper end, and two wings projecting from its sides, and a lug or pivot upon each of said wings, the portion of said blocks between the wings being straight and slightly inclined toward each other when in position, and a hoisting-pulley, the frame of which is provided with a bail.

384,969. TRAVELING-BAG. ALEXANDER C. FRANKIN, Newark, N. J., assignor to Jacob Lagowitz, same place. Filed Dec. 9, 1887. Serial No. 257,413. (No model.)

Claim.—1. The blank herein described for constructing traveling-bags, comprising side C, ends B B, bottom E, and top D, the end portions, B B, being provided with flaps *a*, substantially as shown.

2. In a traveling-bag, the combination of the blank comprising the side C, ends B B, top D, and bottom E, flaps *a*, secured to the ends B B, and fastenings G, passing from the outer face of the top and bottom through the flaps *a*, all substantially as shown.

3. In combination with side C, ends B B, and top and bottom D E, formed of straw-board or similar material, flaps *a*, secured or formed upon the end portions, substantially as shown, an impervious covering applied to the outer face of the material forming the side, ends, top, and bottom, and of a length sufficient to cover the exposed edges of the top and bottom portions, and fastenings G, uniting the ends with the top and bottom, all substantially as shown.



4. In a traveling-bag, the combination of the bent body A and the flanged fastening devices G, uniting the parts of the body A at its corners, substantially as shown, and adapted to protect the exposed edges of the top and bottom.

5. In the manufacture of traveling-bags, the blank herein described, comprising the rectangular body portion C, adapted to form the side of the bag, rectangular sections D E and B B, forming, respectively, the top, bottom, and ends, and adapted to be bent or folded upon lines coinciding with the edges of the body portion C, flaps *a a*, projecting from opposite edges of the end sections and adapted to be folded or bent thereupon on lines coinciding with the top and bottom edges of the body portion C, and a covering applied to the face of the blank and projecting beyond the ends of the top and bottom sections.

384,970. HAY OR STRAW GRAPPLING FORK. ROBERT V. R. GARDNER, West Town, N. Y. Filed Dec. 28, 1887. Serial No. 259,243. (No model.)

Claim.—1. In a hay-fork, the combination, with a clevis, a pair of arms, and tines pivoted in the outer ends of the arms, of links loosely connecting the upper ends of the tines to the arms, and spring-actuated

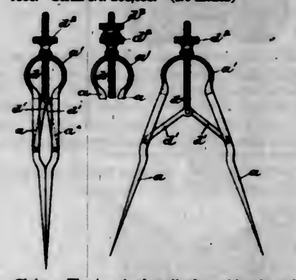
384,970.

locking-bolts pivoted in two of the links and adapted to engage the arms, substantially as set forth.

2. In a hay-fork, the combination, with a clevis, a pair of arms pivoted therein, the outer ends of said arms being composed of parallel plates, and tines pivoted between the said plates, of links loosely connecting the upper ends of the tines with the arms, and spring-actuated locking-bolts pivoted in two of these links, each of these bolts having a head thereon adapted to pass between the plates of the arms and lock the tines in position.

3. In a hay-fork, the combination, with a clevis, a chock-block secured therein, a pair of arms pivoted above this block, the outer ends of said arms being composed of parallel plates, tines pivoted to the arms, and spring-actuated locking-bolts pivoted in two of the links and adapted by their engagement with the plates to lock the tines in position, of a swinging bracket pivoted to the clevis, said bracket having pulleys and an eye therein, and tripping-ropes attached to the locking-bolts, passing over the pulleys and through the eye in the swinging bracket, substantially as set forth.

4. In a hay-fork, the combination, with a clevis, two arms, two transverse heads having tines, and plates secured to the arms and pivoted to the heads, of spring-actuated locking-bolts located between the plates and provided with heads adapted to enter between and engage the under edges of the plates, and tripping-ropes to rock the locking-bolts and release the transverse heads, substantially as set forth.



5. In a hay-fork, the combination, with a clevis and two arms pivoted thereto, of two transverse heads, tines for each head, plates secured to the ends of the arms and pivoted upon the transverse heads, spring-actuated locking-bolts that are located between the plates, with heads that are flattened to slide between the plates and lock under their edges, and tripping-ropes to rock the locking-bolts and secure or release the transverse heads and tines when these heads and tines are in position to lift a load of hay or straw or deposit it, substantially as set forth.

6. In a hay-fork, the combination, with two arms loosely connected, two plates affixed to the outer end of each arm, and two transverse heads provided with teeth and pivoted between the plates, of two links for each head, a spring-actuated locking-bolt for each pair of links and pivoted to them, an arm affixed to each locking-bolt to rock them and lock or release the transverse heads and teeth, two ropes attached to the rocking arms to move them and the attached locking bolts, and two springs connected so as to rotate the locking-bolts and lock their heads to the arm-plates when the strain on the tripping-ropes is released and the arms are depressed near their point of pivotal junction, substantially as set forth.

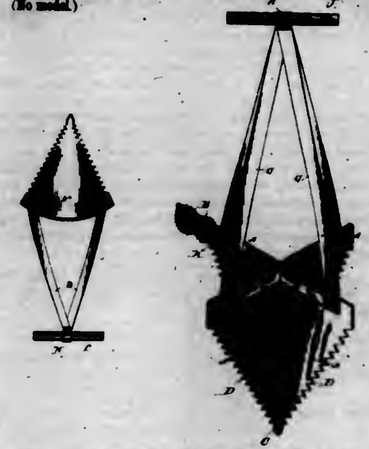
7. In a hay-fork, the combination, with two arms pivoted to a

clevis and two plates affixed to the outer end of each arm so as to be spaced apart and parallel, of two transverse heads pivoted between the ends of the plates, two tines for each head, two links for each head that are jointed together and pivoted to the head and adjacent arm, a locking-bolt loosely secured to one of the links and adapted to be vertically reciprocated when the transverse heads are vibrated on their pivot-connections with the arm-plates, a rocking arm attached to each locking-bolt, two tripping-ropes that are connected to the ends of the rocking arms, and two springs also attached to these arms to cause them to have locked contact with the arm-plates when the tines of the fork are in closed adjustment, substantially as set forth.

384,971. SPRING-DIVIDERS. JAMES F. GUTHRIE, Jr., Somerville, assignor of one-half to Thomas C. Ashley, Boston, Mass. Filed Mar. 6, 1888. Serial No. 266,695. (No model.)

Claim.—The herein-described combination of legs *a a*, connected together by a spring, *a'*, with levers *d' d'*, pinned to legs *a a*, and connected with a stem, *d*, projecting above the spring *a'* to receive a nut, all substantially as and for the purpose set forth.

384,972. STEAM-BOILER. PROSPER HAVENS, Brussels, Belgium. Filed Mar. 10, 1888. Serial No. 266,893. (No model.) Patented in Belgium Nov. 9, 1886, No. 78,167, Feb. 24, 1887, No. 78,483, and Dec. 14, 1887, No. 79,980; in France Nov. 15, 1886, No. 179,647, and Feb. 26, 1887, No. 179,647, and in England Dec. 20, 1887, No. 17,697.



Claim.—1. The combination, in a sectional steam-boiler, of a group of tubes at an angle exceeding forty-five degrees with the horizon, but not quite vertical, and having junction-boxes, steam and water containers and reservoirs, baffle-plates dividing the group of tubes longitudinally into three or more sections, of which the lowest section first receives the action of a furnace placed in front thereof, masonry arches to direct the course of the flames and gases, and inspection and cleaning doors, all arranged substantially as described.

2. The combination, with the tubes and the upper tube-junction box of sectional steam-boilers, arranged as specified, of an internal beveled projection or lip at the upper side of the head of each tube formed on the interior of the separate boxes, substantially as and for the purposes set forth.

3. In a sectional steam-boiler, the combination, with the upper steam and water reservoir and a discharge-pipe, S', disposed as specified, of a series of steam-domes connected successively by pipes, the last pipe descending so far into the last of the series of domes as to compel the steam to alter its direction to arrive at the steam-pipe, and the last dome being provided with a funnel extending below water-level, substantially as and for the purposes set forth.

4. In a sectional steam-boiler, the combination, with the upper junction-boxes for coupling the ends of the tubes, of the tubes secured into the said boxes, and circular beveled projections at the ends of the said tubes inside the boxes for preventing accumulated water from hindering the free escape of the steam, substantially as set forth.

384,973. CAN-OPENER AND SHEET-METAL CUTTER. ELISHA HAWES, Sacramento, Cal. Filed Aug. 24, 1887. Serial No. 247,779. (No model.)

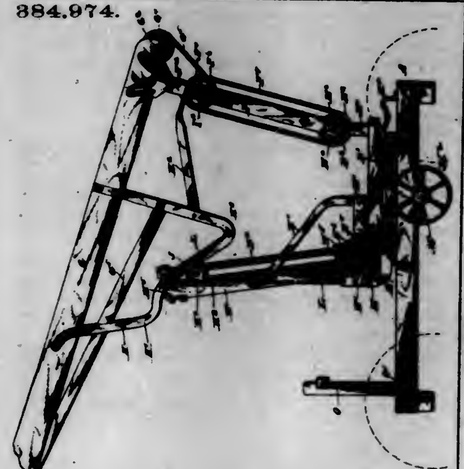
Claim.—1. A can-opener and sheet-metal cutter having a wedge-shaped blade provided with serrations or teeth on its outer converging edges and adapted to be forced through a can from the point of the blade to its base.

2. A can opener and sheet-metal cutter having the radial blades A, provided with toothed downwardly-converging edges, substantially as described.

3. The can-opener having the radial blades A, having the downwardly-converging toothed outer edges, and the upwardly-converging arms G, attached to the upper sides of said blades, substantially as described.

4. The can-opener having the radial cutting-blades A, one of which is provided with the projection or extension K, and the rotary cutters B, journaled on one side of said arm or extension and provided with serrated edges, substantially as described.

384,974. STRAW-STACKER. MARSH HENDRON, Cartinville, Ill. Filed Dec. 8, 1887. Serial No. 257,288. (No model.)

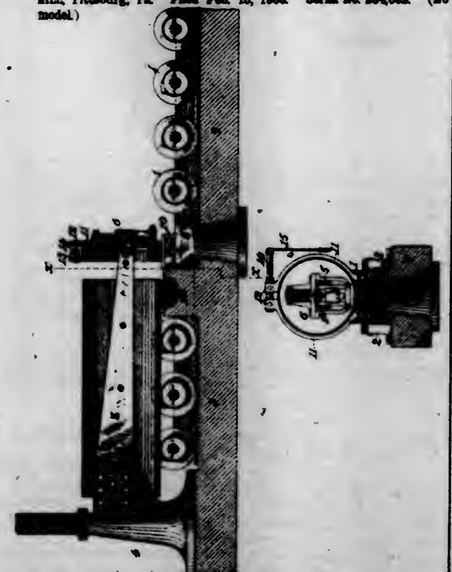


Claim.—1. The combination, with the base A, of the plates B and B' and turn-table C, the frame E, the risers H, the screw-threaded rods H^4, the blocks H^3, the shaft J, spools J', carrier-frame G, pivoted as at F^4, and having the guides K, riding in said spools, the supports F, pivoted as at F^3, and the rope L, substantially as specified.

2. The combination of the frame E, having the risers H, mounted near its rear end and each having the guide H^2, block H^3, and screw-threaded rod H^4, provided with the gear H^5, with the transverse shaft J, having the spools J', and shaft H^3, having the gear H^7, meshing with the gear H^5, substantially as specified.

3. The combination, with the risers H and their screw-threaded rods H^4, blocks H^3, mounted on the rods, and shaft J, journaled in the blocks H^3 and carrying spools J', of the carrier-frame G, having the depending guides K, bearing in said spools, substantially as specified.

4. The carrier-frame G, having the guides K, formed with the bent portions K', depending therefrom, and the straight braces G^2, co-



384,974.

cured thereto, in combination with the risers H, screw-threaded rods H^4, blocks H^3, mounted on the rods, shaft J, mounted in the blocks H^3, and provided with spools J', substantially as specified.

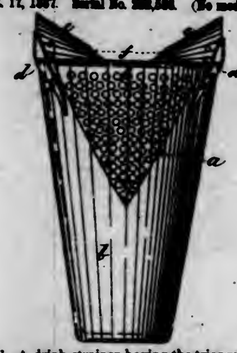
5. The combination, with the base A, having the bars A', and plates B and B', having the turn-table C, mounted between said plates, of the frame E', mounted on said turn-table and carrying the risers H, screw-threaded rods H^4, shaft J, the latter carrying spools J', blocks H^3, the pivoted supports F', and carrier-frame G, having guides K and ropes L, substantially as specified.

384,975. APPARATUS FOR WELDING TUBES. JAMES HEMPHILL, Pittsburg, Pa. Filed Feb. 15, 1888. Serial No. 264,062. (No model.)

Claim.—1. In an apparatus for welding tubes, the combination of an anvil for supporting the tube or cylinder and a steam-hammer operative within the cylinder, substantially as set forth.

2. In an apparatus for welding tubes, the combination of a movable anvil for supporting the tube or cylinder and a steam-hammer operative within the tube or cylinder, substantially as set forth.

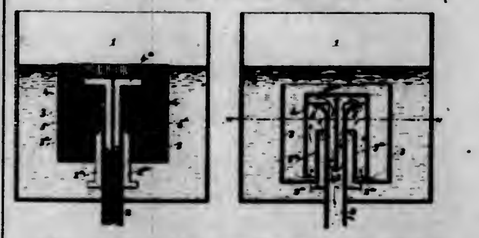
3. In an apparatus for welding tubes or cylinders, the combination of an anvil having clamping-arms hinged thereto and a steam-hammer operative within the tube or cylinder, substantially as set forth.



4. In an apparatus for welding tubes or cylinders, the combination of an anvil for supporting the tube or cylinder, a steam-hammer operative within the tube or cylinder, and a heating-furnace in the line of movement of the tube or cylinder along the anvil, substantially as set forth.

384,976. MOLD. JAMES HEMPHILL, Pittsburg, Pa. Filed Apr. 10, 1888. Serial No. 270,168. (No model.)

Claim.—A mold for the production of articles having projections parallel, or approximately so, to its axis, consisting of a sheet-metal shell of a cross-sectional contour corresponding to that of the article to be cast, and a backing of dry sand or other yielding material, whereby provision is made for the transverse yielding of the walls of the mold as the metal solidifies and contracts, substantially as set forth.



384,977. DRINK-STRAINER. CAREL B. HOPKINS, Louisville, Ky. Filed Oct. 17, 1887. Serial No. 252,502. (No model.)

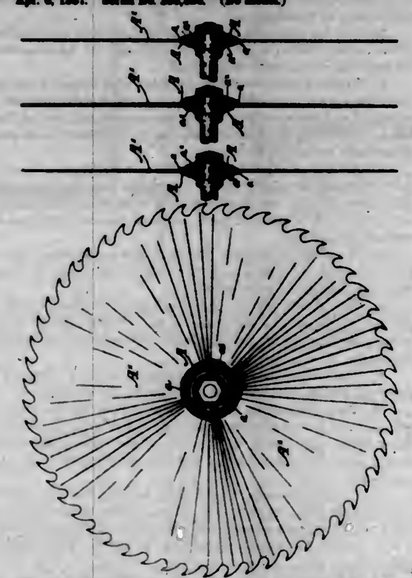
Claim.—1. A drink-strainer having the triangular perforated section *a* and the flaring wings *c c*, substantially as and for the purposes specified.

2. A drink-strainer having the triangular perforated section *a*, the flaring wings *c c*, and the spring-clips *g g*, which extend in the same direction and substantially parallel with the edges of the triangular perforated section *a*, substantially as and for the purposes specified.

384,978. AUTOMATIC FLUSHING-TANK. HENRY L. HOWE, Canandaigua, N. Y. Filed May 25, 1887. Serial No. 239,240. (No model.)

Claim.—1. The automatic intermittent siphon constituted of the discharge-pipe 2, extending upward within the tank, the annular floating bucket 3, surrounding the discharge-pipe 2, and the inverted bucket 4, covering the top of said discharge-pipe, substantially as and for the purposes set forth.

2. The combination of the tank 1, the vertical discharge-pipe 2, provided with a valve-seat, 5^a, the annular floating bucket 3, provided with a central tube, 5^b, constituting a valve, and suitable guides, 5^c, for the vertical movement of the said floating bucket, as explained.



3. The combination of the vertical discharge-pipe 2, the annular floating bucket 3, having limited vertical movement relatively to said discharge-pipe, and the inverted bucket 4, resting on the bottom of the bucket 3 when the latter is elevated and supported, so as to leave

space between the lower margin of the inverted bucket and the bottom of the floating bucket when the latter is lowered, thus serving to regulate the escape of water from said floating bucket, as explained.

4. The combination, with the vertical discharge-pipe 2, floating bucket 3, and inverted bucket 4, of the guides 2^c and 4^c, constituting stops to limit the descent of the floating bucket 3 and inverted bucket 4, as and for the purposes set forth.

5. The combination, with the vertical discharge-pipe 2, floating bucket 3, and inverted bucket 4, of the guides and stops 2^c and 4^c, formed of ribs or plates to prevent eddying or vertical movement in the discharged water.

384,979. CIRCULAR SAW. DENTON H. HOOD, Kokomo, Ind. Filed Apr. 6, 1887. Serial No. 233,893. (No model.)

Claim.—1. A circular saw formed with an abrupt or substantially square shoulder at that distance from its center which will include that portion which does not enter the wood and of substantially parallel sides from said shoulder to its periphery, substantially as herein shown and described.

2. A circular saw formed with a thick central portion, the edge of which forms an abrupt shoulder in the saw-blade, and from said shoulder to its periphery being formed of parallel or substantially parallel sides, substantially as herein shown and described.

3. A circular saw formed with a thick central portion, an abrupt shoulder at the edge of said thick portion, and a thinner portion from said shoulder to the edge of the saw, substantially as set forth.

384,980. SEAT FOR VELOCIPEDES. THOMAS B. JEFFERY, Ravenswood, Ill. Filed Apr. 16, 1887. Serial No. 235,185. (No model.)

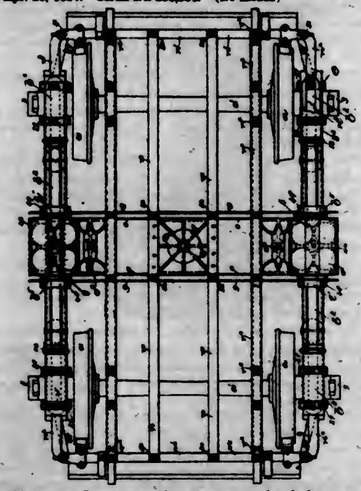
Claim.—1. In combination with the backbone or saddle-tree, the seat and supports for the same on the tree at the front and rear ends, both supports being adapted to yield elastically rearward, and check straps or links to limit their reaction upward, substantially as set forth.

2. In combination with the backbone or saddle-tree, the seat, a spring-support for its forward end, a link connecting the seat to such spring-support, a check-strap adjustable in length which ties the end of the spring downward to the backbone, and a rear support for the seat adjustable back and forward, substantially as set forth.

3. In combination with the backbone or tree and a flexile seat, supports for both ends of the seat secured upon the tree, the front support pivoted forward of the seat and extending rearward and upward, the rear support wholly under the seat and having its pivotal point forward of the center of the seat, whereby weight upon the seat causes both springs to yield elastically rearward, substantially as and for the purpose set forth.

4. In combination with the backbone or saddle-tree, a flexile seat, a support on the tree forward of the seat for the forward end of the seat, a support on the tree for the rear end of the seat, wholly under the seat and having its pivotal point forward of the center of the seat, thereby yielding elastically downward and rearward, the said rear support being adjustable back and forward on the tree, whereby the tension of the seat and its height from the tree are made adjustable each with or without change of the other, substantially as set forth.

5. In combination with the backbone or saddle-tree, a flexile seat, a support on the tree for the forward end of the seat, a support on the tree for the rear end of the seat, yielding elastically downward and rearward, and a link adjustable in length connecting the rear end of each rear support down to the tree, the said rear support being adjustable back and forward on the tree, whereby the tension of the seat and its height from the tree are made adjustable each with or without change of the other, substantially as set forth.



6. In combination with the backbone or saddle-tree, the rear seat-support, D, comprising the portions D^{10} and D^{12} and the connecting coil-spring portion D^{11} at the forward part, the part D^{10} being adjustably secured to the tree and the part D^{12} being fixedly secured to the seat, and the adjusting-strap F, connecting the rear of the part D^{12} to the rear part of the seat, substantially as set forth.

7. In combination, substantially as set forth, the backbone or saddle-tree, the seat, the rear spring-support for the seat, and the adjusting or check strap, the spring-support having its spring flexure at the front and having its lower branches, D^{10}, united rearward of the securement to the backbone and forming a bend above the same, whereby said bend serves as a loop or staple in which to secure the adjusting or check strap to the backbone.

8. In combination with the backbone or tree, a flexile seat, a support on the tree for the forward end of the seat yielding elastically downward and rearward, and a check and adjusting strap, as G, connecting the spring-support down to the tree, and a support for the rear end of the seat secured to the tree and adjustable back and forward thereon, substantially as set forth.

9. In combination with the backbone or saddle-tree and a flexile seat, spring-supports for the seat secured upon the tree and extending rearward and upward to their connection with the seat, whereby they tend to yield rearward and downward, the rear support being longer than the forward support, whereby the seat in yielding toward the rear on both its spring-supports is also stretched to take up the slack caused by the rider's weight, substantially as set forth.

384,981. CAR-TRUCK. LOUDER K. JEWETT, Boston, Mass. Filed Apr. 20, 1887. Serial No. 235,561. (No model.)

Claim.—1. In a car-truck, a transom and end pieces composed of metal plates and transom-braces A, extended upward above the bolster, combined with longitudinal braces between the said end pieces and transom-braces, substantially as described.

2. The metallic side plates of the transom, combined with metallic angle or channel iron braces, having arms extended from a bottom

bar, the side plates being riveted or attached to the arms of the said braces, the bottom bars forming the bottom of the transom, substantially as described.

3. The U-shaped or bifurcated transom-braces having ears 25, combined with transom-plates the edges of which engage the said ears, substantially as described.

4. The metallic transom-plates and the metallic flanged or channeled transom-braces to which the said plates are attached, combined with the arch-bar-sustaining blocks riveted or bolted to the outer sides of the transom-plates, substantially as described.

5. The arch-bar-sustaining blocks recessed at their inner ends to form shoulders 22 and 23 for the reception of the transom-plates, combined with the said transom-plates, substantially as described.

6. The transom-plates, transom-braces to which they are attached, and the arch-bar-sustaining blocks attached to the transom-plates *g g* and having shoulders 47, combined with the shouldered transom-seats *r*, placed between the said blocks, substantially as described.

7. The metallic bolster-plates *o*, combined with end braces, *o'*, to which they are riveted, the edge of the plate and ends of the brace engaging each other, as described, to prevent shearing strain on the rivets uniting the said parts, substantially as described.

8. The bolster-plates and braces *o'* near each end, combined with intermediate flanged braces to sustain the said plates between their ends, substantially as described.

9. The bolster-plates *o* and braces *o'* and flanged braces o^3, combined with the center plate riveted or bolted to the said braces o^3, substantially as described.

10. The plates *o* and braces *o'*, combined with the center plate provided with shoulders 380 and flanges 38, to rest upon and overlap the bolster-plates, the lower end of the said center plate being riveted or bolted to the said bolster-plates, substantially as described.

11. The bolster-plates *o*, the braces *o'*, and the center plate, combined with the king-pin plate o^4, located directly under the center plate and provided with a hole for the king-pin, all the said parts being riveted together, substantially as described.

12. The wheels, axles, housings, the equalizers supported by the housings, the transom, arch-bars, truss *e*, and equalizer-springs, combined with the arch-bar-sustaining blocks attached to the transom and having a foot to rest upon the seat of the top of the equalizer-spring, substantially as described.

13. The bolster-plates *o* and braces to which they are riveted, combined with the center plate, and the curved plates having depending vertical flanges fitted between the bolster-plates and riveted thereto, and also having horizontal shoulders resting upon the upper edges of the bolster-plates, substantially as described.

14. In combination, a transom composed of metal plates and channel-iron transom-braces to which the said plates are attached, the braces being extended above the upper edges of the transom-plates, and a bolster composed of metal plates *o* and braces *o'*, and intermediate flanged braces or center plate attached to the bolster, pedestals, arch-bars extended from one to the other pedestal, trusses extended from one to the other pedestal, a rocker, loops b^3, suspended from the rocker, spring-seats supported by the said loops, and springs mounted on the spring-seats, substantially as described.

15. The pedestals provided at their upper ends with grooves, combined with arch-bars and the trusses *e*, both secured to the pedestals, substantially as described.

16. The pedestals having grooves 10 and 12 12 at their upper sides, combined with the arch-bars and trusses *e*, placed in the said grooves and connected to the said pedestals, substantially as described.

17. The pedestals and the arch-bars, and trusses *e*, attached to the said pedestals, combined with the pedestal-caps and pedestal-straps bolted together, substantially as described.

18. The pedestals and the arch-bars, and trusses *e*, attached to the said pedestals, combined with the pedestal-caps, the end pieces, *n'*, extended between the said arch-bars and pedestal-caps, and with bolts to unite the said parts, substantially as described.

19. The pedestals and the arch-bars, and trusses *e*, attached to the said pedestals, combined with the said pedestal-caps, the end pieces, *n'*, extended between the arch-bars and the pedestal-caps, and with the auxiliary flanged end pieces, *s*, and bolts to unite the said parts together, substantially as described.

20. In a car-truck, a metallic transom, pedestals, and arch-bars, and trusses *e*, connected to the upper ends of the pedestals, combined with arch-bar-sustaining blocks connected to the transom and provided with ears to rest upon shoulders of the pedestals, the pedestals supporting the outer ends of the said blocks, substantially as described.

21. In a car-truck, a metallic transom, pedestals, and arch-bars, and trusses *e*, connected to the upper ends of the pedestals, combined with arch-bar-sustaining blocks connected to the transom and provided with ears to rest upon shoulders of the pedestals, the pedestals supporting the outer ends of the said blocks, and with pedestal-caps to overlap or engage the outer ends of the said blocks and keep them seated on the pedestals, substantially as described.

22. In a car-truck, a metallic transom, pedestals, and arch-bars, and trusses *e*, connected to the upper ends of the pedestals, combined with arch-bar-sustaining blocks connected to the transom and provided with ears to rest upon shoulders of the pedestals, the pedestals supporting the outer ends of the said blocks, pedestal-caps to engage and retain the blocks *f*, seated on the pedestals, and with a bolt, as 33, to hold together the pedestals, pedestal-caps, blocks *f*, arch-bars, and trusses *e*, substantially as described.

23. The metallic transom, arch-bar, the arch-bar-sustaining blocks connected thereto, and the truss *e*, combined with the pedestals having grooves 7 and downwardly-inclined lips at their inner sides to support the trusses where they pass from the horizontal top surface of the pedestals to the under side of the arch-bar-sustaining blocks, substantially as described.

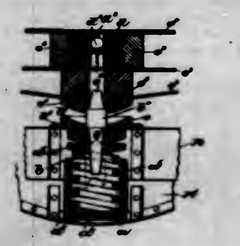
24. In a car-truck, the transom and the arch-bars, combined with pedestals, each having a groove at its upper side for the reception of the arch-bar, substantially as described.

25. The arch-bars, the saddle provided with flanges to embrace it and having ears provided with bolt-holes, the metallic transom, its connected arch-bar-sustaining blocks, trusses, pedestals, and pedestal-straps, combined with bolts to unite the saddle, blocks, and straps, substantially as described.

26. The pedestals provided with the upwardly-turned abutment and the arch-bar-sustaining blocks *f*, provided each with an inclined end to meet the said abutment, combined with the arch-bar extended through grooves in the said blocks and into the said pedestals, substantially as described.

27. The metallic transom, arch-bars, trusses, pedestals, and end pieces, *n'*, combined with the braces r^3 and r^4, connected to the said transom, substantially as described.

28. The metallic transom, arch-bars, trusses, pedestals, and end pieces, *n'*, combined with the braces r^3 and r^4, connected to the said transom, and with the braces *n*, all combined to operate substantially as described.



29. The combination, with the pedestals and end pieces, of the diagonally-placed pedestal-braces 58, substantially as described.

30. The combination, with the wheels, axles, and bearings, the arch-bars and trusses arranged in the line of the bearings, and springs also located in the line of the bearings, of an equalizer-bar located directly under the arch-bar and in line with the bearings, substantially as described.

31. In a passenger-car, wheels, axles, bearings therefor, pedestals to receive the bearings, arch-bars, trusses, bolster-supporting springs, links, and spring-seats mounted thereon, combined with equalizers, all located outside the wheels, substantially as and for the purpose described.

32. In a car-truck, end pieces crossing each end of the car-truck and a transom having upwardly-extended transom-braces shaped to receive within them the bolster, combined with channel or flanged braces extended from one to the other of the said end pieces and connected to said transom-braces, substantially as described.

384,982. CAR-TRUCK. LUTHER K. JEWETT, Boston, Mass. Filed Oct. 7, 1887. Serial No. 251,706. (No model.)

Claim.—1. In a swing-motion truck, the combination, with a metallic transom, of a center-bearing support and journal or pivotal bearings therefor, upon which the said center-bearing support is adapted to be rocked or swung, substantially as and for the purpose specified.

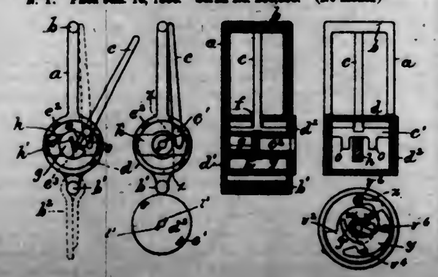
2. In a swing-motion truck, a center-bearing support, *a*, and a spring sustained thereby, combined with a rocking cap, a^2, and plate b^2, substantially as described.

3. In a car-truck, the combination, with the king-bolt, of a lubricating cup or receptacle therefor, and a support for said cup located below the car-floor and concealed from view, substantially as described.

4. In a swing-motion car-truck, the combination, with the king-bolt, of the removable bearing caps or blocks b^2 a^2, substantially as and for the purpose specified.

384,983. GRAIN-METER. GEORGE H. LAIRMAN, Champaign, Ill. Filed Dec. 3, 1887. Serial No. 256,882. (No model.)

Claim.—1. The combination, with the frame, of the supporting-shaft journaled in the frame, carrying-arms rigidly fixed to said supporting-shaft formed with bearings in their ends, a scale-beam rigidly projected from the supporting-shaft, the grain-measure having a hinged bottom and swung on trunnions arranged in the bearings of the carrying-arms, and a lever-arm rigidly fixed in the supporting-shaft, arranged with its free end to press against and close the hinged bottom of the measure, substantially as described.



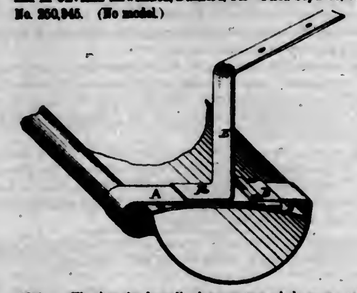
2. The combination, with the frame provided with vertical guide-rods at its sides and a supporting-shaft mounted in the frame provided with carrying-arms having elongated bearings, of the grain-measure having a hinged bottom and supported on trunnions in the slotted bearings of the carrying-arms, and said trunnions being extended and arranged between the vertical guide-rods and having guide-arms near the bottom of the measure to slide between the said guide-rods, and the scale-beam rigidly fixed in the supporting-shaft and arranged with its free end to press against and close the hinged bottom of the measure, substantially as described.

3. The combination of the frame provided with vertical guide-rods, a supporting-shaft journaled in the frame, the grain-measure having horizontal guide-arms projected from its sides provided with anti-friction rollers to fit within the way between the vertical guide-rods of the frame, and carrying-arms rigidly secured to and projected from the supporting-shaft and provided with slotted bearings in which the guide-arms of the measure rest, substantially as described.

4. The combination, in a grain-measuring machine, of a suitably-supported shaft, a graduated beam fixed to the shaft, arms projected from the shaft to support the measure, and a lever-arm on said shaft to close the bottom of the measure after its contents have been discharged, and whereby the said beam, supporting-arms, and lever-arm are operated by the same movement of the shaft, substantially as described.

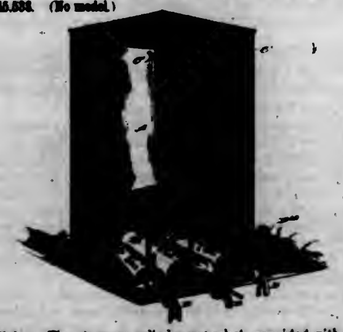
5. The combination, with the delivery-spout provided with tallying mechanism and the grain-measure having a lift device attached to and extended above the side thereof, of a valve journaled to set across the mouth of the spout and having its journal formed to engage the lift on the measure, and a pawl fixed on said journal to move the tally mechanism, as described.

384,984. SAFETY-BUCKLE. JOSEPH G. KITCHELL, New York, N. Y. Filed Jan. 16, 1886. Serial No. 208,903. (No model.)



Claim.—1. The safety-buckle herein shown and described, consisting in the frame *a*, constructed integrally with the lock box or casing at its base and the cross-bar *b* at its farther end, the tongue *c*, hinged upon a fixed pivot within the casing and movable to and from the cross-bar *b* when unlocked, and the locking device operating within the casing to prevent the lateral movement of the tongue upon its pivot, substantially as herein set forth.

2. The safety-buckle herein shown and described, consisting in the frame *a*, constructed integrally with the lock box or casing at its base and the cross-bar *b* at its farther end, the tongue *c*, hinged upon a fixed pivot within the casing and movable to and from the cross-bar *b* when unlocked, and a locking device consisting in a rotary cam arranged within the casing and adapted when actuated by the key of said locking device to hold the tongue against the cross-bar *b*, substantially as herein set forth.

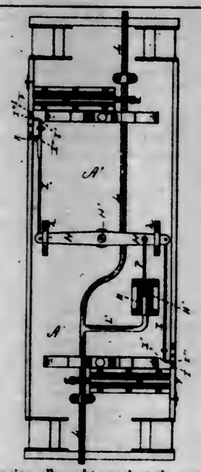


3. The safety-buckle herein shown and described, consisting in the frame *a*, constructed integrally with the lock box or casing at its base and the cross-bar *b* at its farther end, the tongue *c*, hinged upon a fixed pivot within the casing and movable to and from the cross-bar *b* when unlocked, the casing provided with the aperture *f*, to permit the movement of such tongue, and a rotary cam applied to the side of the tongue within the casing to hold the point of the tongue upon the cross-bar *b*, as and for the purpose set forth.

384,985. EAVES-TROUGH HANGER. HOWARD T. LAWRENCE and H. ORVILLE LAWRENCE, Danbury, Pa. Filed Sept. 28, 1887. Serial No. 250,945. (No model.)

Claim.—The herein-described eaves-trough hanger, consisting of the strip A, bent to the form of a trough, with its ends united by a loop, B, as described, the movable brace D, and a suspender, as and for the purpose set forth.

384,986. MEASURING-TANK FOR OIL. MARCELLUS J. LINDSAY and DAVID M. ROSS, Bellevue, Iowa. Filed July 26, 1887. Serial No. 245,533. (No model.)

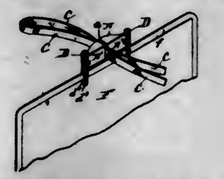


Claim.—The air-tight cylinder or tank A, provided with the graduated measures B B' B², having the air-tubes C, communicating with the air and measures, in combination with the faucets D, having the long and short parallel bores D' D², the outlet-bore D³, and the three-port valve D⁴, having the ports *d d'* at the intersection of said bores, the bore D' terminating in the measure and the bore D² communicating with the tank, substantially as specified.

384,987. RAILWAY-CAR. CHARLES W. LITTLEFIELD, Amesbury, Mass. Filed Nov. 3, 1887. Serial No. 254,190. (No model.)

Claim.—1. In a railway-car, the combination of a stove adapted to slide transversely with the car, a spring arranged to force the stove normally, by means of suitable connections, toward the outside of the car, a swinging door normally locked and placed next said stove, and a lever and suitable intermediate mechanism, whereby said door may

384,987.



be unlocked and the spring allowed to project the stove from the car, substantially as and for the purpose set forth.

2. The combination of the stove B, provided with the base B' and flanges B'', the plate C, provided with the depression C', grooves C'', and slots C''', the tube E, provided with the spring E'', block E', and slide D, the engaging-pin D', lever K, and rod I, substantially as and for the purpose described.

3. The combination of the stoves B, each provided with the base B', flanges B'', and funnel *b* *b'*, having a miter-joint at *b'*, the plates C, slotted at C''', engaging-pins D, springs E'' and blocks E', tubes E, doors F, rods I, bent, as described, at I' and I'', lever H, and actuating-lever K, substantially as and for the purpose set forth.

384,988. REIN-HOLDER. FREDERICK W. C. MACDONALD, Chicago, Ill. Filed Feb. 27, 1888. Serial No. 265,304. (No model.)

Claim.—1. The rein-holder consisting in the combination of a suitable frame with a toggle-acting rein-clamping lever mounted thereon, said clamping-lever being provided with a yielding cushion on its end to bear against the reins, substantially as specified.

2. The combination, with a box or frame having a transverse vertical slot, of a pair of toggle-acting rein-clamping spring levers or jaws furnished with yielding cushions on their ends, substantially as specified.

3. The combination, with a box formed of part A, with plates A' A' dovetailed thereto, and provided with a transverse vertical slot, *a*, of toggle-acting spring rein-holders B B, substantially as specified.

4. The combination, with a box formed of part A, with plates A' A' dovetailed thereto, and provided with a transverse vertical slot, *a*, of toggle-acting spring rein-holders B B, furnished with cushions b^3 b^3 at their adjoining ends, substantially as specified.

5. The combination, with a box formed of part A, with plates A' A' dovetailed thereto, and provided with a transverse vertical slot, *a*, of toggle-acting spring rein-holders B B, furnished with cushions b^3 b^3 at their adjoining ends, and attachment-posts D D, furnished with dovetail grooves *d*, said box having dovetail tenons at its ends fitting in said grooves, substantially as specified.

6. The combination, with a box formed of part A, with plates A' A' dovetailed thereto, and provided with a transverse vertical slot, *a*, of toggle-acting spring rein-holders B B, furnished with cushions b^3 b^3 at their adjoining ends, and attachment-posts D D, furnished with dovetail grooves *d*, said box having dovetail tenons at its end fitting in said grooves, and said posts D being provided with clips d' d', for securing the same to the dash-board, substantially as specified.

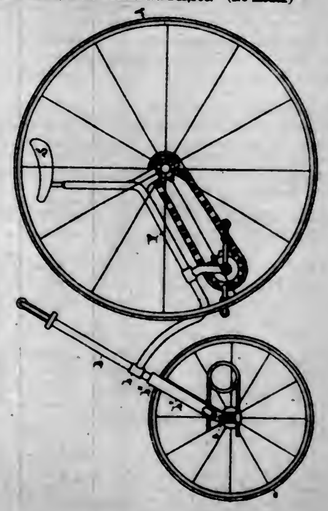
7. The rein-holder consisting of a pair of toggle-acting levers furnished with cushions on their adjoining ends to bear against the reins, substantially as specified.

8. The combination, with posts D, adapted to be secured to the dash-board and provided with dovetail grooves *d*, of a rein-holder frame having ends furnished with tenons to fit in said dovetail grooves, substantially as specified.

384,989. CARRIAGE-WHEEL FENDER. GEORGE C. W. MACOMBER, Tomkinstown, assignor of two-thirds to the American Patent Exchange, Washington, D. C. Filed Dec. 1, 1887. Serial No. 256,512. (No model.)

Claim.—1. The combination, with the flexible overhanging apron, of a holder therefor formed with spring-jaws adapted to embrace the rim of a wheel, as set forth.

2. The combination, with the apron, of a holder therefor attached thereto and formed with spring-jaws, and spring-arms, as *d*, substantially as and for the purpose specified.

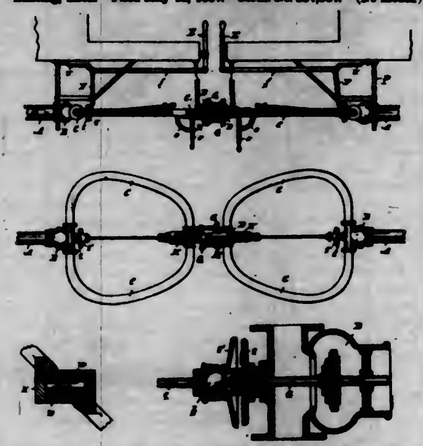


3. A wheel-fender consisting of an apron, a holder therefor formed with spring-jaws and spring-arms, and a back plate, all arranged and operating substantially as and for the purpose specified.

4. A holder for a wheel-fender apron, formed of spring material, and comprising spring-jaws and spring-arms, all formed of a single piece, substantially as described.

5. The improved holder described, consisting of spring-jaws, curved spring-arms, and a back plate, all formed of a single piece, as shown and described.

6. A holder for the purpose described, formed with curved spring-arms and spring-jaws, the clamping ends of which are rounded and bent outwardly, substantially as shown and described, and for the purpose specified.



384,990. VELOCIPEDE. MARIAN H. MARLIN, New Haven, Conn. Filed June 6, 1887. Serial No. 240,362. (No model.)

Claim.—1. The combination of the members b^2 b^2 of the fork b^2, having the clips d^2 d^2 attached thereto and the slots *e* therein, the wheel *a*, its axle-bolt *c'*, passing through said slots, the clips c^2 c^2, attached thereto, and the springs *s*, arranged to be held by their projecting ends in said clips, substantially as described.

2. The combination of the members b^2 b^2 of the fork b^2, having the clips d^2 d^2 attached thereto and the slots *e* therein, the wheel *a*, its axle-bolt *c'*, passing through said slots, the clips c^2 c^2 upon the projecting ends of said bolt, the nuts c^2 c^2 upon the same outside of said clips, and the springs *s*, arranged to be held by their projecting ends in said clips, substantially as described.

384,991. AUTOMATIC PIPE-COUPLING. JAMES F. MCELROY, Lansing, Mich. Filed May 12, 1887. Serial No. 237,937. (No model.)

Claim.—1. In a pipe-coupling for railway-trains, the combination, with a train-pipe, of a coupling-head suspended by an elastic hanger or hangers and connected with the end of the train-pipe by one or more lateral curved expansible branch pipes, substantially as described.

2. In a pipe-coupling for railway-trains, the combination with the train-pipe, of a coupling-head suspended by two oblique flexible hangers and connected with the end of the train-pipe by two curved lateral branch pipes of flexible metal, substantially as described.

3. In a pipe-coupling for railway-trains, the combination, with the coupling-head, of a valve secured to the head of the train-pipe, one or more laterally curved or arched branch connections between the coupling-head and valve, and a pull-rod connected with said valve and coupling-head, substantially as and for the purpose specified.

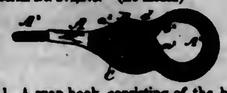
4. In a pipe-coupling for railway-trains, the combination, with the coupling-head, of a valve secured to the head of the train-pipe, one or more laterally curved or arched branch connections between the coupling-head and said valve, a sliding valve-stem in said valve, and a pull-rod connecting said valve-stem with the coupling-head and having a limited sliding play therewith, substantially as described.

5. In a pipe-coupling for railway-trains, the combination, with the coupling-head, of a valve secured to the head of the train-pipe, one or more laterally-arched pipe-connections between said valve and the coupling-head, a sliding valve-stem in said valve, a pull-rod secured to said valve-stem by a universal joint and connecting it by a limited sliding joint with the coupling-head, a disk-fulcrum secured to the valve, and a disk-fulcrum secured to the pull-rod, all arranged to operate substantially as described.

6. In a pipe-coupling for railway-trains, the combination, with a valve located between the coupling-head and the train-pipe, of a hand-lever pivoted to the car for operating the valve, and operating connection comprising a spring connected with the car, and a toggle-lever, one end engaging with the valve-stem and the other with said spring, whereby the angular position of the toggle-lever locks the valve in its open and closed position, substantially as described.

7. In a pipe-coupling for railway-trains, the combination, with a valve located between the coupling-head and the train-pipe, of a hand-lever and connection for operating said valve at will of the operator, and an automatically-operating connection between said valve and the coupling-head, substantially as described.

8. In a pipe-coupling for railway-trains, the combination, with a coupling-head provided with a coupling-flange, of two coupling-hooks hinged together and slidingly secured to said coupling-head, a lever for projecting and retracting said coupling-hooks, and suitable guides for imparting to said coupling-hooks an opening movement when projected and a closing movement when retracted, substantially as described.

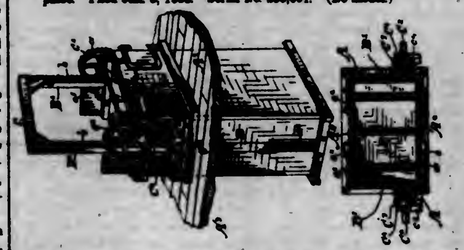


9. In a pipe-coupling for railway-trains, the combination of a coupling-head provided with a coupling-flange, of two flaring guides secured to said coupling-head, at points at an angle to the top and bottom sides of said coupling-head, and of coupling-hooks working in slots in said guides, and means for moving said hooks, all substantially as described.

10. In a pipe-coupling for railway-trains, the combination, with a coupling-head provided with a coupling-flange, of two coupling-hooks hinged together at their rear ends and slidingly secured to said coupling-head upon opposite sides thereof, an operating-lever for said hooks, an incline formed on each coupling-hook and corresponding incline formed on the coupling-head, a spring pressing against the back of each coupling-hook, a locking-guide near the forward end of each coupling-hook, and a guide at the hinged rear end of said coupling-hooks, substantially as described.

11. In a pipe-coupling for railway-trains, the combination of the flanged coupling-head C, the sliding coupling-hooks H, hinged together at their rear ends, the guide-bracket K, the link I, and the lever J, all arranged to operate substantially as described.

12. In a pipe-coupling for railway-trains, the combination, with the train-pipe, of a flanged coupling-head, the pull-rod *c*, a sliding connection between the pull-rod and coupling-head, a valve secured to the end of the train-pipe, the disks *e* *e'*, secured in juxtaposition to each other, one to the valve-case and the other to the pull-rod, a lever and connection for opening and closing said valve by hand, coupling-hooks sliding on and operating in connection with the coupling-head, and a hand-lever and connection for opening and closing said coupling-hooks, all arranged to operate substantially as described.

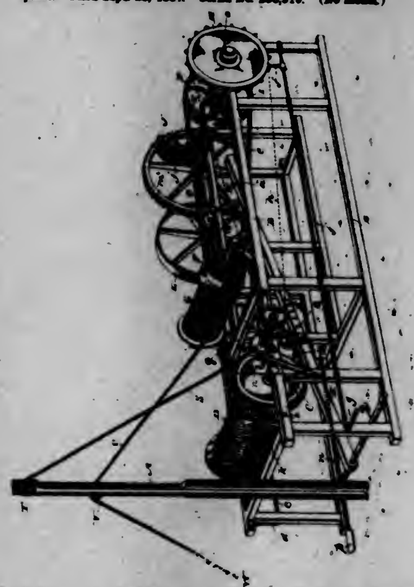


384,992. SNAP-HOOK. HENRY MCPHERSON, Troy, N. Y., assignor to the Sweet & Clark Manufacturing Company, same place. Filed Apr. 20, 1886. Serial No. 271,279. (No model.)

Claim.—1. A snap-hook consisting of the body A, having the semicircular cavity *a* therein, having two flat side walls a^4, integral with said body, and the closure a^2 with the latch B pivoted thereto, and having the shoulder b^2 and a spring interposed on the periphery of said latch between said closure and shoulder, substantially as and for the purpose described.

2. In a snap-hook, the combination of the body A, having the segmental cavity *a* and two flat side walls, a^4, integral with said body, the closure a^2 at one end of said cavity, and the flange a^3 at the other, with the latch B pivoted to said body, and having the shoulder b^2 and a spring interposed on the periphery of said latch between the closure a^2 and said shoulder, substantially as and for the purpose described.

384,993. BALING-PRESS. GEORGE W. L. MEYER and THOMAS J. SEYFFERT, Indianapolis, Ind., assignors of one-third to John C. Ertel, same place. Filed Jan. 3, 1888. Serial No. 259,691. (No model.)



Claim.—1. The combination, in a baling-press, of the box A, provided with the vertical ways a^4 in each side, the follower B, mounted on the uprights B', said uprights B' being mounted in the vertical ways a^4 and provided on their front edges with racks *b* and yoked together at their top, the shaft C, carrying the small pinions *c'*, which mesh with each of said racks on the uprights B' and the large gear-wheels C' on its outer ends, and the short crank-shafts C^3, journaled on the sides of the box and provided with the pinions c^3, which mesh with said gear-wheels C' of said shaft C, substantially as described, and for the purposes specified.

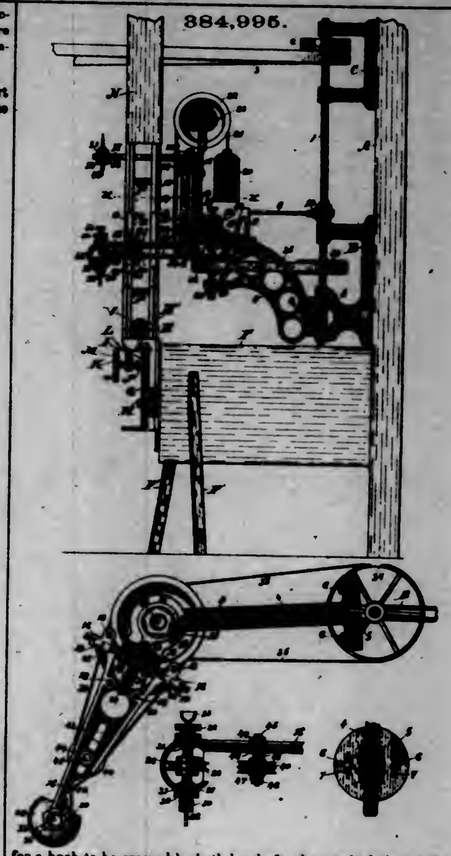
2. In a baling-press, the combination of the box A, the follower B, mounted within said box and supported on uprights B', said uprights B' mounted in vertical ways in each side of said box and provided with a rack on their front sides, a shaft, C, carrying pinions meshing with

said racks, suitable gearing for operating said shaft C, and anti-friction rollers e^1, mounted behind said uprights opposite the points where the pinions engage with the rack-bars on their front sides, substantially as set forth.

384,994. WELL-DRILLING MACHINE. JAMES F. MOORE, Fort Worth, Tex., assignor to the Fort Worth Iron Works Company, same place. Filed Sept. 28, 1887. Serial No. 250,919. (No model.)

Claim.—1. A well-drilling machine which comprises the drill-rope mechanism, including the sprocket-wheel H and clutch O, the handle *g*, and lever *f*, the brake *m'*, having handle *l*, and pawl *i*, having handle K, and the sand-rope mechanism, including the pulley I and clutch P, the compound lever *a b c*, having handle *d*, the treadle *p* and brake *q*, and intermediate levers, *n n*, the treadle *p* and handles *d g k* being all located at the front, two on the left and two on the right of the machine, and the several parts being constructed, arranged, and supported in a frame, substantially as set forth, whereby a foot and both hands can be conveniently used for effecting the several operations described.

2. A well-drilling machine, which comprises the drill-rope mechanism, including the sprocket-wheel H and clutch O, the handle *g* and lever *f*, the brake *m'*, having handle *l*, and pawl *i*, having handle K, the curved depressing-arm provided with friction-rollers, and the sand-rope mechanism, including the pulley I and clutch P, the compound lever *a b c*, having handle *d*, the treadle *p*, and brake *q*, and intermediate levers, *n n*, the treadle *p* and handles *d g k* being all located at the front, two on the left and two on the right of the machine, and the several parts being constructed, arranged, and supported in a frame, substantially as set forth, whereby a foot and both hands can be conveniently used for effecting the several operations described.



384,995. CARVING-MACHINE. STEPHEN F. MOORE, Milwaukee, Wis. Filed Jan. 7, 1888. Serial No. 260,005. (No model.)

Claim.—1. In a carving-machine, a horizontally-swinging arm, 4, the standard 13, located near to the arm 4 and hinged and swinging horizontally thereon, with the horizontally-projecting arms 16 and 17, one above the other, secured together at their inner ends near to and supported and having a vertical movement on the standard 13, which arms carry in their outer ends, at a distance from the standard 13, the cutting-tool and guide-spindle, respectively, substantially as described.

2. In a carving-machine, a horizontally-swinging arm, 4, the thereon-supported and thereto-pivoted standard 13 and the tool and guide carrying frame, with a band-wheel, 36, pulley 38, pulley 29, located below the lower arm of the tool-carrying frame, and belt 39, said band-wheel, pulleys, and belt being located below the lower arm, 16, of the tool-carrying frame, substantially as described.

3. In a carving-machine, a cutting-tool in a spindle located and supported in a bracket formed in the free end of a swinging arm, which bracket is expanded into a globe-like shield mostly surrounding the spindle and its driving-pulley thereon, said bracket, so expanded, being adapted for a guard for the inclosed mechanism and

384,995.

for a knob to be grasped by both hands for the manipulation of the cutting-tool, substantially as described.

4. The horizontally-swinging hinge 5 and the thereto adjustably-secured arm 4, with collar 10, and the brace-rod 8, adjustably secured at one end to the arm 4 and at the other end to the collar 10, the axis of which collar is the continuation of the axis of hinge 5, substantially as described.

5. In a carving-machine, a spindle-holding sleeve, 50, provided with a flange or head, 52, and a nut, 51, with a supporting-arm, 17, having an aperture, in which the sleeve 50 is located, somewhat larger than said sleeve, substantially as and for the purpose set forth.

6. The horizontally-swinging arm 4, provided with the ring-face 11, in combination with the rotating hinge 12, and the securing pivotal bolt 54, having beveled shoulder 56, adapted to receive a corresponding beveled bearing on the hinge 12, the remainder of that part of the shank of the bolt passing through the hinge 12 being smaller than the aperture through the hinge, substantially as and for the purpose described.

7. The lubricating device consisting of a supporting-arm, 4, provided with a recess, 57, and a face, 11, and the thereon-supported and rotating hinge 12, pivotal bolt 54, and oil-cup 58, having a duct therefrom through the bolt 54 into the recess 57, substantially as described.

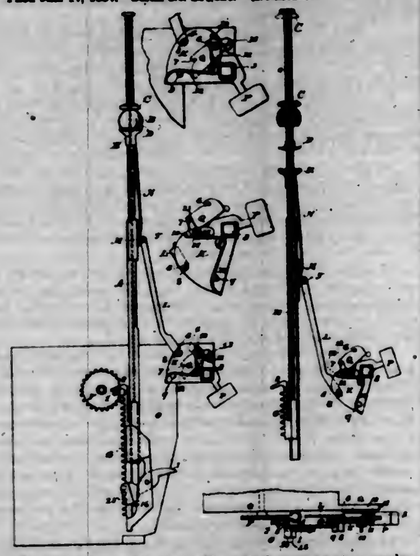
8. In a carving-machine, a swinging arm, 4, carrying the cutting-tool and pattern-guide in a frame supported on an arm hinged on said arm 4, said arm 4 being secured adjustably to its pivotal hinge 5 by means of set-screws 6 6, whereby the arm 4 may be rotated limitedly on its longitudinal axis, thereby providing for an inclined or under cut of the tool, substantially as described.

9. In a carving-machine, a pulley, 40, supported on a pivot-bolt, 45, by collars 41 and 47, which bolt is secured in a swinging arm of the machine, in which arm said bolt is adjustable horizontally, whereby said pulley is adapted for use as a belt-tightener in said arm, substantially as described.

10. In a carving-machine, a spindle, 49, supported adjustably in an arm, 17, by a sleeve, 50, provided with a flange, 52, and the thereto-through-turning set-screw 53, and a nut, 51, turning on the sleeve 50, substantially as described.

11. In a carving-machine, a vertically-moving tool and guide-carrying frame connected with and forming a part of a horizontally-swinging portion of the mechanism, and a gravity-weight connected to said frame by a cord running over a pulley, whereby said frame is balanced and supported at any point vertically to which it is moved by extrinsic force, substantially as described.

12. In a carving-machine, a table having a lower and an upper leaf, one directly above the other, the upper one being supported on and connected to the lower one by supporting-rods pivoted thereto, whereby the two leaves are constantly parallel to each other, the table being supported pivotally, whereby it is adapted to be tilted, substantially as described.



13. In a carving-machine, a vertically-moving frame, E, the thereto-supported tilting parallel leaves D D', and the guide-frame N, substantially as described.

14. A table consisting of the upper and lower leaves, D and D', connected together by thereto-jointed rods O O and supported pivotally on the uprights E' E', the uprights E E' supported movably on and forming a part of the frame E, the frame E supported and having a vertical movement on a sill, F, the upright rails of the frame E being adapted as guides for the ends of the table in its tilting movements, substantially as described.

15. The combination of a frame provided with two horizontal arms, one above the other, carrying the cutting-tool in one arm and the guide in the other arm, said frame being supported and having vertical movement on a standard hinged to a swinging inner arm, 4, with a table having upper and lower leaves for supporting, respectively, the pattern and material to be carved, substantially as described.

16. The combination of the swinging arm 4 and the swinging tool and guide-carrying frame, with the frame E and the two-leaved tilting table D D', all located, supported, and arranged substantially as described.

384,996. TIME-BALL. CHARLES MELLEN, San Francisco, Cal. Filed Jan. 17, 1887. Serial No. 224,693. (No model.)

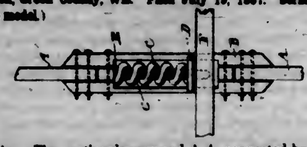
Claim.—1. In combination with a clock movement or mechanism, the hollow shaft or pipe A, ball or disk C, stationary ball B, hour balls or disks D E, and operating mechanism, substantially as and for the purpose set forth.

2. In a time-ball mechanism operated by clock-work, cog-wheel F, rack-bar G, pawl I, hollow shaft or pipe A, lifting-rod H, stationary ball B, ball or disk C, hour balls or disks D E, rod N, sleeve M, stop-plate Q, pivoted lever 11, pins or projections 8, 9, 10, and 13, and spring 12, substantially as and for the purpose set forth.

384,997. BASE-SCREEN FOR VEHICLES. JOHN H. MURPHY, Hartland, Minn. Filed Nov. 30, 1887. Serial No. 256,122. (No model.)

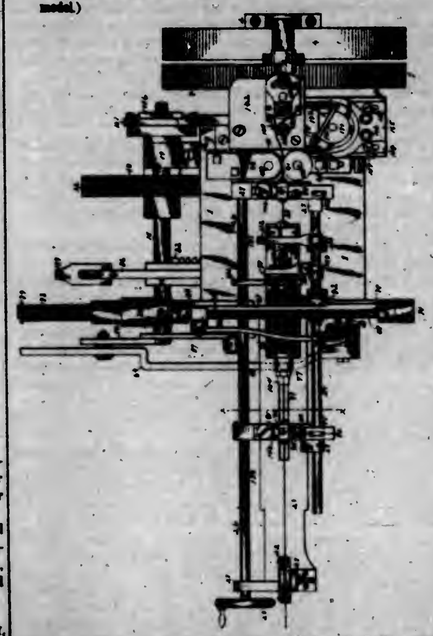
Claim.—1. A dash-frame for vehicles, consisting of the two cast-

384,997.



legs A and B, having the integral cast-arms A' and B', respectively, terminating in form for permanent connection with each other, substantially as specified.

2. A dash for vehicles, consisting of the castings A and B, having the integral arms A' B' centrally connected, as at C, substantially as specified.



3. A dash for vehicles, consisting of the castings A and B, having the chamfered arms A' B' connected, as at C, and provided with the covering D, substantially as specified.

384,998. PUMP-ROD FOR WINDMILLS. DANIEL B. HEYN, Jefferson, Green County, Wis. Filed July 19, 1887. Serial No. 244,773. (No model.)

Claim.—The sectional pump-rod A A, connected by the parallel cheek-pieces B B, the tongue E, secured between the cheek-pieces, and the spring C, surrounding the tongue E, in combination with the beams F F, and the plate D, supported thereon and adapted to guide the cheek-pieces at each side to receive the tongue through a hole in the center, and to support the spring C, substantially as described.

384,999. WIRE BENDING AND FORMING MACHINE. SAMUEL T. NEWMAN, Danbury, Conn., assignor of two-thirds to the Hat Wire Company, same place. Filed Mar. 19, 1883. Serial No. 267,603. (No model.)

Claim.—1. The combination, with oscillating shaft 30, carrying a gear, 29, the feed-rollers, feed-gears, and feed-pinions, of pins 45 on

opposite sides of the oscillating shaft, each of which carries a gear engaging gear 29, a ratchet under said gear rigidly secured thereto, a disk under said ratchet carrying pawls engaging the ratchet, the teeth of the ratchets being inclined in opposite directions, and a gear under the disk engaging one of the feed-pinions, whereby oscillation of shaft 30 in either direction carries the feed-rollers forward by driving the mechanism on one of the pins 45, the mechanism on the other pin being driven, the return movement of shaft 30 carrying the feed-rollers forward again through the operation of the mechanism on the other pin 45, the driving mechanism in the forward movement being driven during the return movement.

2. The combination, with oscillating shaft 30, carrying a gear, 29, shafts 42, carrying the feed-rollers, feed-gears, and feed-pinions, of pins 45, having journaled thereon gears 46, engaging gear 29, ratchets under said gears secured thereto and having teeth inclined in opposite directions, disks under said ratchets carrying spring-pawls engaging the ratchets, and gears under the disks engaging the feed-pinions.

3. Shafts 42, carrying the feed-rollers, the feed-gears which engage each other, and the feed-pinions not in engagement, in combination with pins having journaled thereon gears 46, under said gears ratchets rigidly secured thereto and having teeth inclined in opposite directions, under said ratchets disks carrying pawls which engage the ratchets, and under said disks gears rigidly secured thereto which engage the respective feed-pinions, whereby forward movement of either of the gears 46 will actuate both of the feed-rollers.

4. Shafts 42, carrying the feed-rollers, the feed-gears which engage each other, and the feed-pinions, in combination with gear 29, gears 46, ratchets 47, moving therewith, disks under said ratchets carrying pawls which engage the ratchets, and gears 49 under said disks and connected thereto, which engage the respective feed-pinions, the teeth of said ratchets being inclined in opposite directions, so that when either of gears 46 is driven the corresponding gear 49 will be driven and will carry both feed-rollers through the engagement of the feed-pinion with said gears 49 and of the feed-gears with each other.

5. The feed-rollers, feed-gears engaging each other, the feed-pinions, and gear 29, in combination with gears 46, ratchets under said gears which are secured thereto and are provided with teeth inclined in opposite directions, disks carrying pawls inclined in opposite directions to engage said ratchets, and gears 49, rigidly secured to said disks, whereby, when either disk 46 is driving the feed-rollers through the corresponding pawls, ratchet, and gear 49, the other gear 49 will be driven in the opposite direction, and the pawls corresponding therewith will drag over the face of the ratchet on that side.

6. The oscillating shaft carrying gear 29, the feed-rollers, feed-gears engaging each other, and the feed-pinions, in combination with gears 46, engaging gear 29, ratchets having teeth inclined in opposite directions, pawls corresponding therewith, and gears 49, engaging the feed-pinions, whereby, when either gear 46 is driving the feed-rollers through the engagement of the corresponding gear 49 with a feed-pinion, the other gear 46 is being driven, but the corresponding gear 49 and disk will be carried in the opposite direction, the pawls being dragged over the face of the ratchet.

7. Shafts 42, journaled in brackets 43 above the bed and bracket 44 below the bed, and carrying the feed-rollers, feed-gears, and feed-pinions, and pins 45, seated in the bed and bracket 44, in combination with gear 29, gears 46, ratchets 47, having teeth inclined in opposite directions, disks 48, carrying pawls engaging the ratchets, and gears 49 under said disks, which engage the feed-rollers.

8. Shafts 42, journaled in brackets 43 above the bed and bracket 44 below the bed, and carrying the feed-rollers, feed-gears, and feed-pinions, and pins 45, seated in the bed and bracket 44, in combination with gears 46, ratchets 47, having teeth inclined in opposite directions, disks 48, carrying pawls engaging the ratchets, gears 49 under said disks, which engage the feed-rollers, and an oscillating shaft carrying a gear, 29, engaging gears 46, as and for the purpose set forth.

9. The combination, with the feed-rollers, feed-gears, and feed-pinions, shaft 30, carrying gear-wheel 29 and pinion 31, and intermediate sets of alternately-acting mechanism which connect gear 29 with the feed-pinions, of a reciprocating rack engaging pinion 31, whereby the feed-rollers are actuated.

10. The combination, with the feed-rollers, shaft 30, having gear-wheel 29 and pinion 31, and intermediate mechanism, substantially as described and shown, of rack 32, lever 37, the crank-disk, and links 36 and 38, whereby each rotation of the crank-disk carries the rack forward and back, thereby actuating the feeding mechanism twice.

11. The combination, with the feed-rollers, oscillating shaft 30, carrying pinion 31, and intermediate sets of mechanism acting alternately, which carry the feed-rollers forward during both movements of shaft 30, of a rack engaging pinion 31, lever 37, a crank-disk having an adjustable block, a link connecting one end of the lever with the rack, and a link connecting the other end of the lever with the adjustable block, whereby adjustment of said block imparts more or less movement to the feeding mechanism and determines the amount of wire drawn forward during each movement.

12. The crank-disk having a sliding block and a gage for adjusting said block, curved and recurved lever 37, rack 32, link 38, connecting one end of said lever with the block, and link 36, connecting the other end with the rack, in combination with the feed-rollers, shaft 30, having a pinion engaged by said rack, and intermediate sets of mechanism, substantially as described and shown, which act alternately and carry the feed-rollers forward during the forward and backward movements of the rack.

13. In a wire bending and forming machine, the combination, with shaft 30, having a gear for actuating the feeding mechanism, and a pinion, 31, and a slide having a rack, of a crank-disk having an adjustable block, and intermediate mechanism, substantially as described, between said crank-disk and rack, whereby reciprocatory movement is imparted to the rack.

14. In a wire bending and forming machine, the combination, with the feed-rollers, feed-gears 54, engaging each other, and the feed-pinions, of oscillating gear-wheel 29 and alternate sets of mechanism, each consisting of a gear, 46, engaging gear 29, a ratchet, 47, connected thereto, a disk having pawls engaging said ratchet, and a gear, 49, connected to the disk and engaging one of the feed-pinions, the teeth of said ratchets being inclined in opposite directions and the pawls arranged to correspond, whereby movement of gear 29 in either direction will carry the feed-wheels forward.

15. In a wire bending and forming machine, the combination, with the feed-rollers, feed-gears 54, engaging each other, and the feed-pinions, of oscillating gear-wheel 29 and alternate sets of mechanism, each consisting of a gear, 46, engaging gear 29, a ratchet, 47, connected thereto, a disk having pawls engaging said ratchet, lugs 52, and springs acting to hold the pawls in operative position, and a gear, 49, connected to the disk and engaging one of the feed-pinions, as and for the purpose set forth.

16. In a wire bending and forming machine, the combination, with suitable feeding mechanism, of holding-clamps which engage the wire at predetermined times, an oscillatory twisting-drum through which the wire passes, and a grip in said drum midway between the clamps, whereby the wire is twisted by movement of the drum.

17. The combination, with the holding-clamps, of slides 95, by which they are operated, and a rock-shaft, 24, having arms 96, whereby the slides are reciprocated.

18. Block 85, having recess 88, with a central boss in the bottom having an opening to receive the wire, in combination with block 91, having a recess to receive boss 89, and slide 95, having incline 101 and 103, whereby block 91 is raised and lowered.

19. Block 85, having a recess in its top, a central boss having an opening to receive the wire, and a vertical block, 91, sliding in said recess and having a recess in its bottom to receive said boss, in combination with a slide having incline which raise and lower block 91.

20. Block 85, having a recess with ways 90, a boss at the bottom having an opening to receive the wire, and a block, 91, sliding on said ways and having a recess in its bottom to receive said boss, in combination with slide 95, having incline 101, to raise the block, and a projection with an incline, 103, whereby block 91 is forced down upon the wire when the slide is drawn outward.

21. Block 85, having ways 90, and boss 89, with an opening to receive the wire, and block 91, sliding on said ways and having a recess to receive said boss, in combination with slide 95, having incline 101 and 103 and slots 98 and 97, guide-screws 99, passing through said slides, and an oscillating arm, 96, engaging slot 97.

22. The combination, with block 85, having boss 89, with an opening to receive the wire, vertical block 91, having a recess in its bottom to receive the boss, and a slide, 95, having incline by which block 91 is raised and lowered, of guides 94 on opposite sides of said block.

23. Block 85, having boss 89, with an opening to receive the wire, a vertical block, 91, having a recess to receive said boss, and an angular slot in line with the opening through the boss, in combination with slide 95, having an incline which forces block 91 downward to clamp the wire in the slot when the slide is moved in one direction and another incline which raises said block to release the wire when the slide is moved in the opposite direction.

24. The combination, with block 85, having bracket 85*, threaded as described, and a recess, 88, with a boss, 89, of block 91, having a recess to receive the boss, and a threaded shaft engaging said bracket, whereby block 85 may be adjusted to any desired position.

25. The bed having extension 21, with slot 87, block 85, having bracket 85*, a recess, 88, and boss 89, and block 91, having a recess to receive said boss, in combination with a threaded shaft engaging said bracket, whereby block 85 may be adjusted, and a screw passing through the slot in the extension and engaging said block, whereby it is locked in position after adjustment.

26. The twisting-drum having within it a cylindrical piece secured thereto, which is provided with a recess having at its bottom a boss, said boss having a hole through which the wire passes, and a block, 111, having an opening in its bottom to receive said boss, in combination with a slide, 110, for raising and lowering said block, and mechanism for reciprocating the slide.

27. The twisting-drum having secured within it a cylindrical piece provided with a recess having at its bottom a boss, said boss having a hole through which the wire passes, and a block, 111, having an opening in its bottom to receive said boss, and a slot for the wire, in combination with a slide, 110, connected to said block by diagonal dovetails, and mechanism for reciprocating the slide.

28. The twisting-drum, cylindrical piece 104, secured thereto, which is provided with guides for the wire, and a recess with a boss at its bottom having an opening for the wire, in combination with a sliding block having a recess in its bottom to receive the boss, a slide for raising and lowering the block, and reciprocating plunger 108, to which the slide is connected, whereby the wire is clamped at predetermined times.

29. The twisting-drum, cylindrical piece 104, constructed as described, block 111, and the slide and plunger, in combination with a sliding plate, 116, which engages the plunger, and a crown-ratchet, 120, whereby the sliding plate and plunger are forced forward, as and for the purpose set forth.

30. The twisting-drum, cylindrical piece 104, constructed as described, block 111, and the slide and plunger, in combination with sliding plate 116, which forces the plunger forward, and sliding cam 127, engaging a flange on said plunger, whereby it is retracted.

31. The twisting-drum and cylindrical piece 104, constructed as described, block 111, and the slide and plunger, in combination with sliding plate 116, which forces the plunger forward, sliding cam 127, engaging a flange on said plunger, whereby it is retracted, said cylindrical piece being rigidly secured to the twisting-drum, and the plunger provided with a key, 115, engaging a groove in the cylindrical piece, whereby said parts are held against independent rotary movement.

32. The twisting-drum, cylindrical piece 104, secured thereto, and standard 77, in which said parts are journaled, in combination with gripping mechanism, substantially as described, within the drum, a grooved reciprocating plunger for actuating the gripping mechanism, and a sliding plate having a bearing engaging the groove in the plunger.

33. The plunger having a flange, 109*, a collar, 129, and a groove, 119, in combination with a sliding plate having a bearing engaging said groove, a crown-ratchet whose teeth force the sliding plate forward, carrying the plunger, and reciprocating cam 127, engaging said plunger and collar, whereby the plunger is retracted, substantially as and for the purpose set forth.

34. The plunger having a flange, 109*, a collar, 129, and a groove, 119, in combination with a sliding plate having a bearing engaging said groove and a roller, 117, and a crown-ratchet whose teeth engage said roller at predetermined times to force the plunger forward, as and for the purpose set forth.

35. The plunger having a groove, 119, and the sliding plate having a bearing engaging said groove, and a roller, 117, in combination with a crown-ratchet, 120, whose teeth engage the roller, a ratchet, 121, secured to the crown-ratchet, and a reciprocating hooked pawl, whereby intermittent rotary motion is imparted to said ratchets, substantially as and for the purpose set forth.

36. The combination, with the plunger, the sliding plate having a bearing engaging said plunger, and a roller, 117, crown-ratchet 120, engaging the roller, and ratchet 121, secured to the crown-ratchet, of rock-shaft 24, having an arm, 123, and a hooked pawl, 122, pivoted to said arm and engaging ratchet 121, substantially as and for the purpose set forth.

37. The combination, with the plunger having flange 109* and collar 129, of rock-shaft 24, having arm 123, and double cam 127, pivoted thereto, which engages said flange, whereby the plunger is retracted when the cam is forced forward, substantially as and for the purpose set forth.

38. The plunger having flange 109*, the sliding plate having a bearing engaging said plunger, crown-ratchet 120, engaging the sliding plate, and ratchet 121, secured to the crown-ratchet, in combination with rock-shaft 24, having arms 123 and 128, a hooked pawl pivoted to one of said arms and engaging ratchet 121, and a cam, 127, pivoted to the other arm and engaging the flange, said arms being so pivoted to the rock-shaft that when the cam moves forward the hooked pawl passes over the face of the ratchet, and when the pawl is carrying the ratchet the cam is moving backward out of operative position, substantially as and for the purpose set forth.

39. The combination, with the plunger, the sliding plate having a bearing engaging the plunger, and a roller, 116, of the crown-ratchet engaging the roller, ratchet 121, secured thereto, a hooked pawl whereby the ratchets are carried forward, and friction-spring 126, whereby the ratchets are held stationary when the pawl moves backward over ratchet 121, substantially as and for the purpose set forth.

40. The sliding frame having bearings 77 and 125, the twisting-drum, and the gripping mechanism, constructed as described, in combination with detachable guide-plate 124 in said bearings, having longitudinal openings to receive the wire.

41. The stationary holding-clamp, frame 78, carrying the twisting mechanism and having a bracket, 122, and block 85, carrying the adjustable holding-clamp and having a bracket, 85*, in combination with shaft 26, having a screw-thread, 180, engaging bracket 85*, and a thread, 181, of half the pitch, engaging bracket 122, whereby rotation of said shaft in either direction will move the twisting mechanism and the adjustable holding-clamp, the position of the twisting mechanism being always midway between the holding-clamps.

42. The bed and extension having, respectively, slots 79 and 87, the stationary holding-clamp secured to the bed, frame 78, carrying the twisting mechanism and having a bracket, 122, and block 85, carrying the adjustable holding-clamp and having a bracket, 85*, in combination with shaft 26, having a screw-thread, 180, engaging bracket 85*, and a screw-thread, 181, of half the pitch, engaging bracket 122, whereby rotation of said shaft in either direction will move the twisting mechanism, and the adjustable holding-clamp and screws 80 and 86, whereby the parts are locked in place after adjustment.

43. The combination, with the holding-clamps and the twisting-drum having gear-teeth on its periphery and a grip midway between the holding-clamps, of a reciprocating rod having rack-teeth engaging the drum.

44. The combination, with the holding-clamps and the twisting-drum having a grip midway between said clamps, of a rack for imparting movement to the twisting-drum in one direction and a spring or weight which causes the return or forward movement of the twisting-drum.

45. The holding-clamps, the twisting-drum having a grip midway between said clamps, and rock-shaft 24, having arms 96, 128, and 126, for operating the clamps and grip, and an arm, 84, in combination with a reciprocating rod having rack-teeth engaging the drum, and lugs 82 and 83, which engage arm 84, to lock and unlock the holding clamps and grip.

46. The combination, with the holding-clamps, the twisting-drum having a grip midway between said clamps, and a reciprocating rod having rack-teeth engaging the twisting-drum and lugs 82 and 83, of rock-shaft 24, carrying arms which operate said clamps and grip, and an arm, 84, which is engaged by said lugs to oscillate the rock-shaft, as and for the purpose set forth.

47. The holding-clamps, the twisting-drum having a grip midway between said clamps, and a reciprocating rod having rack-teeth engaging the twisting-drum and lugs 82 and 83, in combination with a spring surrounding said rod, which is compressed when the drum is turned backward, and rock-shaft 24, carrying arms which operate the clamps and grip, and an arm, 84, which is engaged by said lugs at the completion of the backward movement of said rod to lock the clamps and grip and by lug 82 at the end of the forward movement to unlock them again after the wire has been twisted.

48. The twisting-drum, rod 67, having rack-teeth engaging said drum, and a coil-spring surrounding said rod and bearing against a collar at its outer end, in combination with shaft 61, having arms 62 and 66, said arm 66 being connected to rod 67 by a link, and arm 62 being provided with an offset, 64, and shaft 15, carrying arms 55 and 56, provided with rollers which engage arm 62 from below and raise it until the roller reaches the offset, when the spring acts to return the parts to their normal position.

49. The combination, with the twisting-drum, rod 67, having rack-teeth engaging the drum, and a spring, 73, surrounding said rod, of oscillating arms 62 and 66, the former having an offset, 64, and the latter connected by a link to rod 67, and rotating arms 55 and 56, carrying rollers, which engage arm 62 from below and raise it until the roller in engagement reaches the offset.

50. The combination, with the twisting-drum and rod 67, having a rack engaging the drum, of shaft 61, carrying arms 62 and 66, link 66, and shaft 15, carrying arms 55 and 56, adjustable relatively to each other, said arms being provided with adjustable rollers 58, adapted to engage arm 62.

51. The combination, with the twisting-drum, rod 67, having rack-teeth engaging the drum, a spring surrounding said rod and bearing against its outer end, and a sleeve, 72, inclosing the spring, of arms 62 and 66, link 66, and rotating arms having rollers engaging rod 66.

52. The combination, with the twisting-drum, brackets 85, a key, 70, in one of said brackets, a rod, 67, having a groove engaged by said key, and rack-teeth engaging the twisting-drum, of arms 62 and 66, links 66, and rotating arms having rollers adapted to engage arms 62.

53. The combination, with the twisting-drum and grip, the holding-clamps, and rock-shaft 24, having arms which operate said clamps and grip, and an arm, 84, of rod 67, having rack-teeth engaging the drum, and lugs 82 and 83, the latter being adjustable, and operating mechanism whereby said rod is moved in one direction and the clamp and grip locked at the end of the movement.

54. The combination, with the twisting-drum and grip, the holding-clamps, and rock-shaft 24, having arms which operate said clamps

and grip, and an arm, 84, of rod 67, having rack-teeth engaging the drum and lugs 82 and 83, a coil-spring surrounding said rod and bearing against a collar at its outer end, and operating mechanism whereby said rod is moved in one direction against the power of the spring, and the clamps and grip are locked by lug 83 at the end of the movement and unlocked by lug 82 when the rod is turned by said spring.

55. The holding-clamps and twisting-drum having a grip midway between said clamps, in combination with a reciprocating rod engaging said drum, a spring on said rod which is compressed when the rod moves backward, and mechanism for locking the clamps and grip upon the wire at the end of the backward movement and for releasing them at the end of the forward movement after the wire has been twisted.

56. The holding-clamps, the twisting-drum having a grip midway between said clamps, and adjusting mechanism for the twisting-drum and one of the holding-clamp, whereby the grip is kept midway between the clamps without regard to the length of wire being operated upon, in combination with a reciprocating rod engaging said drum, a spring on said rod which is compressed when the rod moves backward, and mechanism for locking the clamps and grip upon the wire at the end of the backward movement and for releasing them at the end of the forward movement after the wire has been twisted.

57. The holding-clamps and twisting-drum having a grip midway between said clamps, and adjusting mechanism for the twisting-drum and one of the holding-clamps, whereby the grip is kept midway between the clamps without regard to the length of wire being operated upon, in combination with a reciprocating rod engaging said drum, a spring on said rod which is compressed when the rod moves backward, mechanism for locking the clamps and grip upon the wire at the end of the backward movement and then releasing them at the end of the forward movement after the wire has been twisted, and feeding mechanism acting alternately with the twisting mechanism, whereby the wire is drawn forward after being twisted.

58. The twisting-drum having a grip within it, a sliding frame, 78, in which it is journaled and which is provided with a bracket, 132, a reciprocating rack for oscillating said drum, and the stationary and adjustable holding-clamps, in combination with shaft 26, having a screw-thread engaging the adjustable holding-clamp, and a screw-thread of half the size engaging bracket 132, as and for the purpose set forth.

59. The twisting-drum having a grip within it, a reciprocating rack for oscillating said drum, having lugs 82 and 83, and the stationary and adjustable holding-clamps, in combination with rock-shaft 24, having adjustable arms for operating the holding-clamps and grip, and an arm, 84, adapted to be engaged by lugs 82 and 83, as and for the purpose set forth.

60. The combination, with the feeding mechanism and the twisting mechanism, of reciprocating slide 140, carrying bending and forming rollers 150 and 151.

61. The combination, with the feeding mechanism, of reciprocating slide 140, carrying roller 150, and back of said roller a roller, 151, adjustable relatively thereto.

62. In a machine for bending and forming wire, reciprocating slide 140, having at its forward end a roller, 150, in combination with an adjustable plate, 152, carrying roller 151.

63. Reciprocating slide 140, carrying roller 150 and having a slot, 154, in combination with plate 152, having at its forward end a roller, 151, pin 153, passing through said plate and engaging the slot, and a bolt and nut for locking said plate at any desired adjustment.

64. Reciprocating slide 140, carrying a roller, 150, and having a slot, 154, in combination with plate 152, having at its forward end a roller, 151, and at its rear end a curved slot, 155, pin 153, passing through said plate and engaging slot 154, a bolt, 156, passing through slots 154 and 155, and a nut engaging said bolt, whereby roller 151 may be adjusted both longitudinally and laterally relatively to roller 150.

65. Reciprocating plate 144, having slot 146, and block 147, adapted to slide in said slot, in combination with plate 142, having slot 143, and slide 140, carrying the bending and forming rollers and provided on its under side with a box engaging slot 143, and a pin engaging the block in slot 146, whereby the reciprocation of plate 144 causes the slide to reciprocate at right angles thereto.

66. Sliding frame 133, carrying roller 135, slide 140, carrying the bending and forming rollers, and intermediate connecting mechanism whereby reciprocation of the frame causes the slide to reciprocate at right angles thereto, in combination with disk 137, carrying cams 136, adapted to engage said roller to move the frame forward, and spring 138, whereby the frame is returned to its normal position.

67. The combination, with slide 140, carrying the bending and forming rollers, sliding frame 133, having roller 135, and intermediate connecting mechanism, substantially as described, of disk 137, carrying adjustable cams 136, adapted to engage said roller to move the frame, and spring 138, whereby the frame is returned to its normal position.

68. In a machine for bending and forming polygonal wire, the combination, with feeding mechanism and twisting mechanism, of a reciprocating slide carrying bending and forming rollers between which the wire is passed, means for moving the slide forward, and means for simultaneously actuating the feeding mechanism, whereby, when opposite planes of the twisted wire are in contact with the faces of the rollers, any desired set may be given to the wire, depending upon the adjustment of said rollers relatively to each other.

69. In a machine for bending and forming polygonal wire, the combination, with the feeding mechanism and twisting mechanism, of a reciprocating slide carrying at its forward end a roller, 150, and having secured thereto a plate carrying a roller, 151, adjustable both longitudinally and laterally relatively to roller 150, whereby any desired set may be given to the wire and their ends may be caused to meet.

70. The combination, with the feeding mechanism and the twisting mechanism, of bending and forming rollers carried by a reciprocating slide which advances while the feeding mechanism is acting, sliding frame 133, carrying a roller, 135, intermediate connecting mechanism for transmitting the motion of the frame to the slide, and a disk carrying cams which engage said roller and force the frame forward, the amount of movement of said frame and consequently of the bending and forming rollers toward or from the feeding mechanism being governed by the height of the cams, whereby the oval of the hot-wire may be widened or narrowed as required.

71. Slide 140, carrying the bending and forming rollers and having boss 148 and stud 149, plate 142, having a slot engaged by said boss, and a plate, 144, having a diagonal slot and a sliding block therein engaged by said stud, in combination with sliding frame 133, and a bracket, 145, adjustably secured to said frame and carrying plate 144.

72. In a wire bending and forming machine, the combination, with slide 140, having slot 154 and carrying roller 150, of a plate, 152, carrying roller 151 and having a curved slot, 155, pin 153, passing through the plate and engaging slot 154, bolt 156, engaging slots 154 and 155, and a nut engaging said bolt, whereby the parts are locked in position after adjustment.

73. The combination, with the feeding mechanism and the bending and forming rollers carried by a reciprocating slide, 140, of reciprocating plate 158, carrying fixed and movable cutters between which the wire passes, springs 186, for holding said plate to its normal position, and a hammer which strikes the lower cutter while the wire is moving forward.

74. In a wire bending and forming machine, the combination, with reciprocating slide 140, carrying the bending and forming rollers, of plate 158, loosely held in place, springs acting to draw said plate toward the bending and forming mechanism, stationary and movable cutters carried by plate 158, between which the formed wire passes, and a hammer adapted to deliver a blow upon the movable cutter to sever the wire at predetermined times.

75. In a wire bending and forming machine, plate 181, secured to the frame-work, plate 158, carrying stationary and movable cutters between which the formed wire passes, and having slots 160, screws passing through said slots, whereby plate 158 is loosely secured to plate 181, and springs acting to hold it at its forward position, in combination with a hammer which strikes the movable cutter at predetermined times to sever the wire.

76. The combination, with plate 158, loosely held in place and carrying fixed and movable cutters between which the wire passes, and springs for holding said plate at its forward position, of a hammer carried by a rod, 180, a cross-rod, 184, having a bend or offset, 186, one end being pivoted to rod 180, and the other end pivoted at the opposite side of the machine, gear-wheel 7, having cam 19, and a spring, 182, under the hammer, acting to throw the hammer upward against the lower cutter, whereby at each rotation of said gear rod 184 is drawn downward by cam 19, compressing spring 182 until the cam passes off at bend 186, when the spring acts to force the hammer upward against the movable cutter.

77. The combination, with the stationary cutter, the movable cutter, and rod 180, having a hammer at its upper end and a coil-spring under said hammer, of cross-rod 180, having bend 186, one end of said rod being pivoted to rod 180 and the other end to the opposite side of the machine, and gear 7, having cam 19, adapted to engage the cross-rod and draw it down until the cam passes off at the bend, as and for the purpose set forth.

78. The combination, with loose plate 158, carrying fixed and movable cutters, springs 186, acting to hold said plate in operative position, and rod 180, having a hammer at its upper end and a coil-spring under said hammer, of cross-rod 180, having bend 186, one end of said rod being pivoted to rod 180 and the other end to the opposite side of the machine, and a gear, 7, having a cam, 19, adapted to engage the cross-rod and draw it down until the cam passes off at the bend, whereby the blow of the hammer may be delivered while the wire is moving forward, the vibration of plate 158 will insure the perfect separation of the wire, and springs 186 will draw the cutters forward, so that the uncut end cannot pass out.

79. The combination, with the bending and forming mechanism, loose plate 158, and springs 186, which draw said plate toward the bending and forming mechanism, of carrier 163, adjustably secured to plate 158, an upper cutter secured to said carrier, and a vertically-movable block secured to the carrier to which the lower cutter is attached, and a hammer which strikes said block and forces the lower cutter upward to sever the wire.

80. The combination, with the bending and forming mechanism, loose plate 158, and carrier 163, secured to said plate and adjustable in the horizontal plane, of an upper cutter secured to the carrier and a lower cutter carried by a vertically-movable block secured to the carrier.

81. The bending and forming mechanism, plate 158, the carrier having flange 164, and clamping-plate 165, whereby the carrier is adjustably held in place, in combination with an upper cutter secured to the carrier and a lower cutter carried by a vertically-movable block which is secured to the carrier.

82. In a wire bending and forming machine, plate 158, and carrier 163, adjustably secured to said plate and having an opening, 172, and projecting ends 177, in combination with an upper cutter secured to the carrier and a vertically-movable block, 171, carrying the lower cutter, which is provided with shoulders engaging said projecting ends, whereby the downward movement of said block and cutter is limited.

83. Plate 158, the carrier having opening 172 and extension 167, provided with guides 176, and an upper cutter secured to said carrier, in combination with vertically-movable block 171, carrying the lower cutter.

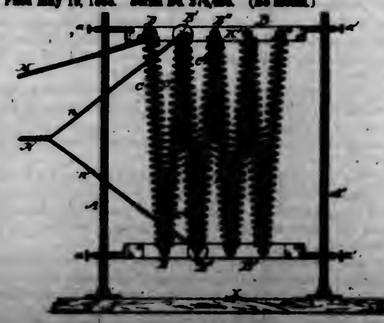
385,000. CAR-COUPLING. FRANCIS W. PARSONS, Philadelphia, Pa.

Filed Jan. 19, 1888. Serial No. 261,322. (No model.)

Claim.—1. In a car-coupler of the class described, the combination of a pivotal jaw with an inclined concentric removable bearing-plate for said jaw, substantially as specified.

2. In a car-coupler of the class described, a draw-head having a pivotal jaw, in combination with a removable bearing-plate for said jaw, comprising inclined concentric ways, substantially as specified.

3. In a car-coupler of the class described, a draw-head having a pivotal jaw having inclined lugs, in combination with a bearing-plate set in a recess in said head and formed with a series of inclined concentric ways for said lugs, substantially as specified.



4. In a car-coupler of the class described, the combination of a pivotal jaw having lugs, and a bearing for said jaw comprising inclined concentric ways, with a gravity-lever pivoted to swing vertically in rear of said jaw and adapted to lock the same, substantially as specified.

5. The head A, having recess A^4, the jaw B, formed with the cut-away portion B^4, and lug B^5, in combination with the gravity-lever D, pivoted, as at D', and having the chamfered lug D^2, substantially as specified.

6. The combination of the head A, having the lugs A^5, the plate C, seated therein and having the perforations C', and inclined ways C^2, in combination with the jaw B, the bolt B', and the lugs B^7, substantially as specified.

385,001. RHEOSTAT. JAMES W. PARKER, New York, N. Y.

Filed May 19, 1888. Serial No. 274,498. (No model.)

Claim.—1. A rheostat which has two independently-adjustable contact-pieces to afford connection between one terminal of the external circuit and the internal circuit of the resistance-coils, substantially as described.

2. A rheostat which has two independently-adjustable contact-pieces to afford connection between one terminal of the external circuit and the internal circuit of the resistance-coils, said contact-pieces being in shunt relation one to the other, substantially as described.

3. A rheostat which has the following parts in combination: a skeleton frame, a set of resistance-coils connected in series and insulated from the frame, an electrical connection between one end of the series and one terminal of the external circuit, and two independently-adjustable contact-pieces which afford connection between the other terminal of the external circuit and the resistance-coils, substantially as described.

4. A rheostat which has the following parts in combination: a skeleton frame, a set of resistance-coils connected in series and insulated from the frame, an electrical connection between one end of the series and one terminal of the external circuit, and two independently-adjustable contact-pieces which afford connection between the other terminal of the external circuit and the resistance-coils, said contact-pieces being in shunt relation one to another.

5. A rheostat which has the following parts in combination: a skeleton frame which has suitable cross-bars resting on divided portions of two of its opposite sides, but insulated therefrom, a set of resistance-coils strung on said bars and connected in series, an electrical connection between one terminal of the exterior circuit and one end of the series of coils, and two socket-pieces which are electrically connected to the other terminal of the exterior circuit, and which fit over the projecting ends of any of the said cross-bars, substantially as described.

385,002. CLAPPER OR RATTLER DEVICE. GERSON PAGAN, Philadelphia, Pa., assignor, by direct and mesne assignments, of two-thirds to W. Harry Mattison, same place. Filed Oct. 19, 1887. Serial No. 252,179. (No model.)

Claim.—1. A clapper composed of a plate, A, having bead or raised edge b^3, and a bar, D, having clapping-blocks E at each end for striking bead or edge b^3, substantially as set forth.

2. A clapper composed of plate A, having bead or raised edge b^3, sounding-box F, and flexible bar or band D, having clapping-blocks E, substantially as set forth.

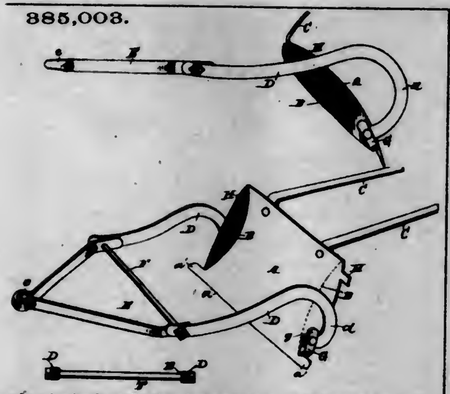
3. A clapper composed of a disk, B, having cross-bar D, with two free ends provided with clapping-blocks E, substantially as set forth.

4. The combination of disk B, having edge b^3, raised center b^4, flexible bar or strip D, and end blocks, E, substantially as set forth.

5. The combination of disk B, having band C, and flexible bar or strip D, having end blocks, E, substantially as set forth.

6. The combination of disk B, having band C and box F, and flexible strip D, having end clappers, E, substantially as set forth.

7. In a clapper, the blocks E, secured to the free ends of a flexible strip or bar, D, substantially as set forth.



8. The combination of disk B, having a sounding-box, F, in its front face and a disk-shaped rear face, and the clapper-blocks E, substantially as set forth.

385,003. SCRAPER. JAMES C. PRESTON, Fort Wayne, Ind. Filed July 15, 1887. Serial No. 244,303. (No model.)

Claim.—1. In a scraper, the combination, with the body, of the draft-bars, the bail, and the brace-bar F, provided at its ends with the reduced portions which serve as pivots to connect the bail with the bars, substantially as set forth.

2. In a scraper, the combination, with the parallel pivoted draft-bars, of the body provided with steps formed integral with the body

385,003.

and projecting laterally therefrom to engage with the draft-bars when the body is inverted, substantially as set forth.

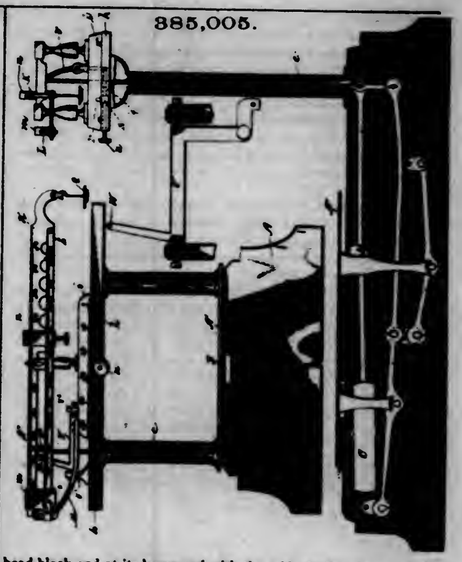
3. A scraper having draft devices pivoted to its sides, and having also its cutting-edge extended laterally in front of the pivots of the draft devices, substantially as set forth.

4. In a scraper, the combination, with the body and the draft-bars, of the ears G, recessed, as at *g*, upon their rear inner faces, whereby there are formed rearwardly-opening seats for the draft-bars, substantially as set forth.

5. A scraper having the bottom and back formed from a single piece of metal, and having the laterally-projecting cutting-edges *d* also formed from the same piece of metal, substantially as set forth.

6. A scraper having the bottom and back formed from a single piece of metal, and having laterally-projecting stops H H also formed from the same piece of metal, substantially as set forth.

385,004. MACHINE FOR SHARPENING SAWS. REUBEN H. PIER, Columbia City, Ind. Filed Mar. 26, 1888. Serial No. 268,497. (No model.)



Claim.—1. A saw-sharpening machine comprising the base having the gages and the beveled grinding-wheel mounted on the base, substantially as described.

2. In a saw-sharpening machine, the combination of the base having the standards B B', the shaft C, journaled in standards B and having the crank and the gear wheel D, the inclined shaft F, journaled in standard B' and one of the standards B, and having the beveled grinding-wheel, and the pinion meshing with the wheel D, substantially as described.

3. The combination of the base, the beveled grinding-wheel mounted thereon, means, substantially as specified, to rotate said grinding-wheel, the laterally-adjustable gage I at the ends of the base, and the vertically-adjustable gage H above the base, said gage H being also adapted to be inclined, substantially as described.

385,005. WEIGHING AND PRICE SCALE. JULIUS B. PITRAT, Gallipolis, Ohio. Filed May 30, 1887. Serial No. 239,572. (No model.)

Claim.—1. The combination, with the platform-levers and the price-beam, of the head-block, and the connecting-rod interposed between and connecting the platform-levers directly with the head-block of the price-beam, substantially as and for the purpose described.

2. The combination, with the platform-levers, the price-beam, the head-block carried by the price-beam, and the rod directly connecting the platform-levers with the head-block, of the head-block retaining-lever, and mechanism, substantially as described, for simultaneously operating the lever and moving the price-beam.

3. The combination, with the platform-levers, the price-beam, the head-block, and the rod pivotally connected at its upper end with the head-block and at its lower end with the said platform-levers, of the head-block retaining-lever, the U-shaped engager carried by the upper end of the lever, and mechanism, substantially as set forth, for simultaneously operating the price-beam and actuating the lever.

4. The combination, with the price-beam and the head-block having a vertical slot, of the retaining-lever and engager carried thereby and adapted to enter the slot, substantially as and for the purpose described.

5. The combination, with the price-beam and the head-block having a transverse opening and a vertical slot, of the rod *c*, having a knife-edged hook fitted in the transverse opening, and the retaining-lever provided with an engager adapted to enter the vertical slot, substantially as and for the purpose described.

6. The combination of the price-beam, the head-block mounted on the said beam, the spring interposed between the end of the head-block and the edge of the beam, the rod *c*, pivotally connected with the head-block, and the retaining-lever provided with the engager, substantially as described, for the purpose specified.

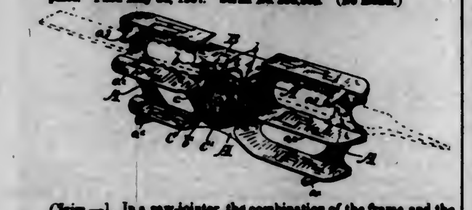
7. The combination, with the sub-base, the price-beam mounted on a base and the head-block, of the retaining-lever having lateral projections between its ends, the uprights, and the pivotal supports, substantially as and for the purpose described.

8. The combination, with the sub-base of the price-beam mounted on a base, and the head-block, of the retaining-lever pivotally supported between its ends on the sub-base, the engager carried by the upper end of the retaining-lever, and the spring connecting the lower end of the retaining-lever with the sub-base, substantially as set forth.

9. The combination with the sub-base, the retaining-lever and the price-beam, and the base having a rack on its under side, of the shaft journaled in bearings in the sub-base and free to have a longitudinal motion in said bearings, and having its inner end bearing against the lower end of the retaining-lever, and the pinion keyed to the shaft and always in mesh with the rack, substantially as set forth.

10. The combination, with the platform-levers, the price-beam, the base carrying the price-beam, and the head-block provided with the index or pointer, of the rod connecting the head-block and the said platform-levers and the retaining-lever, substantially as and for the purpose described.

11. The combination, with the platform having multiplying-levers, the price-beam, and the rod connecting the platform-levers with the price-beam, of the weight-counterbalancing lever located in the said platform and connected with the said rod, substantially as and for the purpose described.



12. The combination, with the price-beam having its left branch slotted, of the head-block having the rod *c* pivotally connected therewith and mounted in said slot, whereby the pivotal supports of the beam and rod *c* may be brought into alignment, as and for the purpose described.

13. The combination, with the price-beam and the platform-levers of the platform provided with a scoop-receiving opening, of the lid or compensating weight for closing said opening, substantially as set forth.

14. The combination of the main and supplemental beams connected together, the one beam having two rows of graduations extended from left to right, the one set of graduations indicating the value and the other set of graduations indicating pounds or units of weight, and the other beam graduated from the center toward each end, representing the rate per unit and the tare of the bob-weight placed on the beam graduated from left to right, the tare-weight placed on the right branch, and the head-block mounted on the left branch of the other beam, substantially as and for the purpose described.

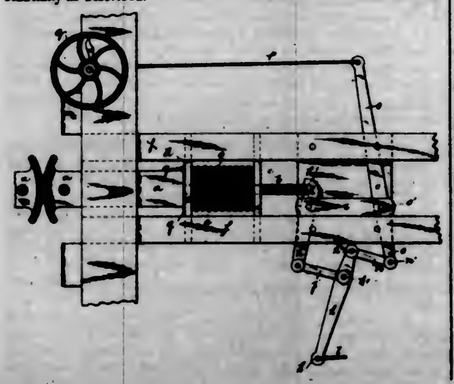
15. The combination, with the sub-base and the two uprights, of the price-beam composed of a main and supplemental beam in the same vertical plane, and the arch or bow shaped pivotal support, the main beam having two rows of graduations extending from left to right, and a third row of graduations extending from the center toward the end, and the supplemental beam having a row of graduations corresponding with the third row on the main beam, and extending from the center toward the opposite end of the beam.

385,006. COMBINED SAW JOINTER AND GAGE. WILLIAM S. RALYA, Indianapolis, Ind., assignor to R. C. Atkins & Company, same place. Filed May 30, 1887. Serial No. 239,594. (No model.)

Claim.—1. In a saw-jointer, the combination of the frame and the clamp for the file, one jaw of which clamp is stationary and the other jaw of which is a cam, substantially as set forth.

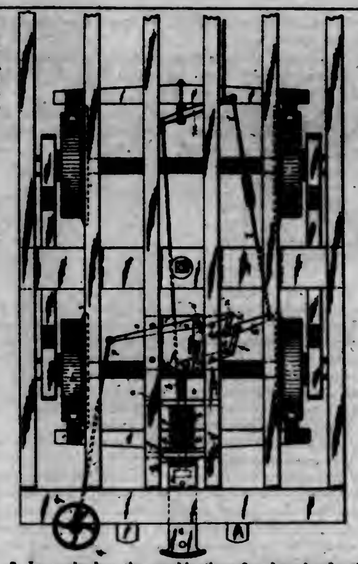
2. In a saw-jointer, the combination of the frame with projections formed thereon, a file resting on said projections, and the cam arranged and secured to bear against the opposite side of said file and clamp it in position, substantially as set forth.

3. In a combined saw jointer and gage, the combination, with the frame, of a file-clamp, bearing-points upon which the saw may rest, and adjustable points mounted to bear against the saw-teeth when they are being set, substantially as set forth.



4. A combined jointer and gage consisting of a frame, A, and a frame, B, adjustably mounted thereon and secured in position by a single screw passing through a slot in said adjustable frame, said adjustable frame being seated in a suitable way in said frame A.

5. The combination of the frame A, the adjustable gage-plate B, the cam-wheel C, the sleeve and cap C', and the screw *b'*, substantially as set forth.

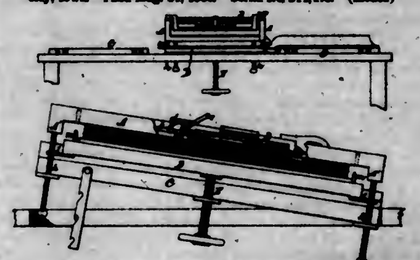


385,007. CAR-BRAKE. ADRIAN REBER, Pittsburg, Pa., assignor to the Reber Safety Brake Company, (Limited,) same place. Filed Oct. 4, 1887. Serial No. 251,451. (No model.)

Claim.—1. In a car-brake, the combination of a draw-head, a pivoted lever interposed in the path of said draw-head or draw-bar, and a brake-operating lever linked to the aforesaid lever and to a stationary pivot, substantially as and for the purpose set forth.

2. In a car-brake, the combination of a draw-head having a draw-bar attached thereto, a spring coiled around said draw-bar and held between two follower-plates, and a disk or bar spring interposed between the rear of the draw-head and the front follower-plate, substantially as described.

385,007.



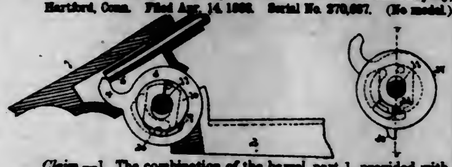
3. In car-brakes, the combination of a draw-head, a lever pivoted in the rear thereof and in the line of movement of the same, another lever pivoted in the rear of the first, and a brake-operating lever having a link-connection with both levers, substantially as and for the purpose set forth.

4. In car-brakes, the combination of the draw-head or draw-bar, a lever, A, interposed in the path of the same, a lever, *o*, pivoted in the rear of said lever A, and a brake-operating lever, *k*, connected to said levers A and *o* by links *j* and *n*, substantially as and for the purpose set forth.

5. In car-brakes, the combination of the draw-head or draw-bar, a lever, A, interposed in the path of the same, a lever, *o*, pivoted in the rear of said lever A, and means for holding said lever stationary, with a brake-operating lever, *k*, connected to said levers A and *o* by the links *j* and *n*, substantially as and for the purpose set forth.

385,008. TYPE-WRITING MACHINE. FRED A. RESLEY, Iowa City, Iowa. Filed Aug. 31, 1886. Serial No. 211,472. (Model.)

Claim.—1. In a type-writer for books or packets, the combination of the frame A, having parallel sides, their upper surfaces forming ways for the carriage, their bottoms adapted to rest upon and hold the paper in position, and being provided with racks *b b*, substantially as shown and described, the carriage B, having dogs *d d*, engaging with the racks, and gibs *c c'* opposite thereto, and a type-writing device, substantially as specified, adapted to print on the upper surface of said paper, substantially as and for the purpose set forth.



2. In a type-writer for books or packets, the combination of the frame A, having parallel ways adapted to rest upon and hold the page in position, a carriage mounted upon said ways and provided with a transversely-moving type-writing apparatus adapted to print on the upper surface of the paper, and a clamp, D E, adapted to press the book or packet tightly against the bottom of the frame, substantially as and for the purpose specified.

3. In a type-writer for books or packets, the combination of the carriage-supporting frame A, mounted on suitable supports, A A A A, and the plate D, having screw E to press the book or packet tightly

and smoothly against the under side of the frame A, substantially as and for the purpose set forth.

4. In a type-writer of the kind specified, the combination of the frame A, clamping device D E, and supports C, hinged to the table, substantially as and for the purpose set forth.

385,009. EXTRACTING MECHANISM FOR REVOLVERS. DAVID H. ESSE, Brookline, Mass., assignor to the Martin Fire Arms Company, Hartford, Conn. Filed Apr. 14, 1888. Serial No. 270,697. (No model.)

Claim.—1. The combination of the barrel part 1, provided with the cam-shoulders 25 26 and a joint part, the frame part 2, having the attached pivot on which the barrel joint part is hung, the latch 19, mounted in said pivot and adapted to engage with said cam-shoulders, arranged to act thereon in opposite directions and be moved in and out thereby, the annular lifter arranged to revolve on said pivot and provided with the notch 9 for engagement with said latch, and the extractor actuated by said lifter, substantially as described.

2. The combination of the barrel part 1, having its joint part and provided with the cam-shoulders 25 26, the frame part 2, pivoted thereto, the sliding latch 19, mounted in said frame part and adapted to be moved positively both in and out of the same by said cam-shoulders, arranged to act in opposite directions thereon in the opening and closing of the barrel, the lifter pivoted on the joint-pin and provided with the notch 9 for engagement with said sliding latch, and the extractor actuated by said lifter, substantially as described.

3. The combination of the barrel 1, having a hinge part and cam-shoulders 25 26, the frame 2, having a pivot part, 10, around which the barrel turns, the latch 19, arranged to move in and out through a slot in said pivot part by engagement with said cam-shoulders, arranged to act in opposite directions thereon, the lifter surrounding said pivot part 10 and slide 19, and having the internal notch, 9, to receive the nose of said slide, and the extractor actuated by said lifter, substantially as described.

4. The combination of the barrel 1, having the joint-leaf 16, provided with an axial nose adapted to receive the hub 10 and having the joint-leaf 17, provided with cam-shoulders 25 26, the frame 2, provided with the attached hub 10, around which the joint-leaf 16 revolves, the latch in said hub arranged to be moved in and out of the same by engagement with said cam-shoulders, arranged to act in opposite directions thereon, the annular lifter provided with the internal notch, 9, and arranged to revolve around said hub between the barrel joint-leaves 16 and 17, and the extractor actuated by said lifter, substantially as described.

5. The combination of the barrel 1, provided with a joint part, the frame 2, provided with an axis upon which said joint part revolves, the latch 19, located in said axis and arranged to be moved in and out of the same by contact with shoulders on the frame, the lifter 3, surrounding and inclosing the said latch within it, and having the internal notch, 9, to receive the same, the extractor actuated by said lifter, and an independent movable cam-surface connected with said joint of the frame and barrel, and arranged to be moved against said latch by hand and withdraw it into said axis at will, substantially as described.

6. The combination of the barrel 1, provided with joint-leaves 16 and 17, the latter being provided with the slot 24, and cam-shoulders 25 26 at opposite sides of said slot, the frame 2, provided with the axis on which the barrel part turns, the lifter 3, surrounding and turning upon and with said axis and provided with the notch 9, the extractor actuated by said lifter, and the latch mounted in said axis and arranged to move radially inward and outward therein, and having a projecting pin part, 28, reaching into said slot 24, made narrower than the breadth of said slot radially, whereby it is enabled to travel through the outer portion of the slot in one direction and the inner portion of it in the other direction when moved by said cam-shoulders, substantially as described.

7. The combination of the barrel 1, having the joint-leaves 16 17, the frame 2, having the joint-leaves 12 15 and the axis connecting these joint-leaves together, the annular lifter having the notch 9 on its internal edge, a latch mounted in the frame part and arranged to be engaged with and released from said internal notch by contact with shoulders on the barrel arranged to act in opposite directions thereon, and the extractor actuated by said lifter, substantially as described.

8. The combination of the barrel 1, having the joint-leaves 16 17, the frame 2, having the attached axis on which these leaves revolve, the latch 19, mounted in said axis and arranged to move in and out of the same by contact with shoulders on the barrel, the lifter mounted on said axis and provided with the internal notch, 9, to receive the latch, the extractor actuated by said lifter, and the revolving disk 27, provided with the cam-shoulder 31, adapted to be brought against said latch by revolving the disk, substantially as described.

9. The combination of the annular lifter 3, provided with the notch 9, its central pivot, 10, attached to the frame, provided with the latch 19, adapted to engage with said notch, the shoulders 25 26 upon the barrel, arranged to engage with said latch and act in opposite directions thereon and move it into or out of such engagement, and the extractor actuated by said lifter, substantially as described.

10. The combination of the annular lifter provided with the notch 9, its central pivot, 10, attached to the frame, provided with the latch 19, adapted to engage with said notch, the cam-shoulder 25 upon the barrel, arranged to engage with said latch and move it out of engagement with the lifter, and the extractor actuated by said lifter, substantially as described.

385,010. MUSIC-HOLDER. EDWARD W. ROBINSON, Portland, Me. Filed May 17, 1888. Serial No. 273,402. (No model.)

Claim.—In combination with the base *a*, the two slides *c d*, arranged so as to approach and touch each other when moved in one direction and to open when moved in the opposite direction by means of the slots *e*, cut in said slides at an angle, as described, and the pins *f*, set in the base *a*, the whole to operate as herein set forth.

385,011. BOTTLE-CLOSURE. WILLIAM ROGERS, Chicago, Ill. Filed May 8, 1888. Serial No. 273,265. (No model.)

Claim.—1. In combination with a bottle, a closure comprising a lid, a band fitting around the neck of the bottle, and an integral portion extending upwardly from the band, having its upper end passed through a hole in the lid and bent or turned over inwardly in contact with the upper part of the bottle-neck, whereby it is prevented from straightening or pulling out, substantially as described.

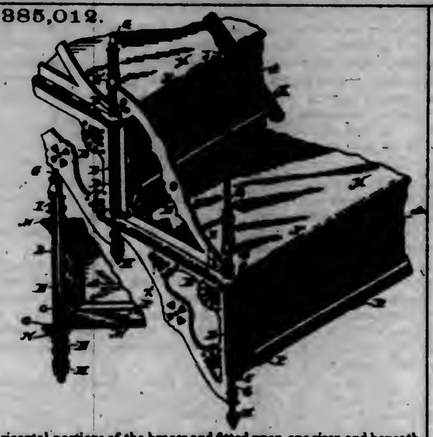
2. In combination with a bottle, a closure comprising a lid having a thumb-piece for holding it in position and opening it upwardly, a band fitting around the neck of the bottle, and an integral portion extending upwardly from the band, having its upper end passed through a hole in the lid and bent or turned over inwardly in contact with the upper part of the bottle-neck, whereby it is prevented from straightening or pulling out, substantially as described.

3. In combination with a bottle, a closure comprising a lid having a thumb-piece for holding it in position and opening it upwardly, a band fitting around the neck of the bottle, and an integral portion extending upwardly from the band, having its upper end passed through a hole in the lid and bent or turned over inwardly and passed downwardly between the band and the bottle-neck, whereby it is prevented from straightening or pulling out, substantially as described.

385,012. STAIRWAY. TIMOTHY ROGERS, Keokuk, assignor, by direct and mesne assignments, to the Rogers Frame Company, Springfield, Ohio. Filed Jan. 13, 1888. Serial No. 260,961. (No model.)

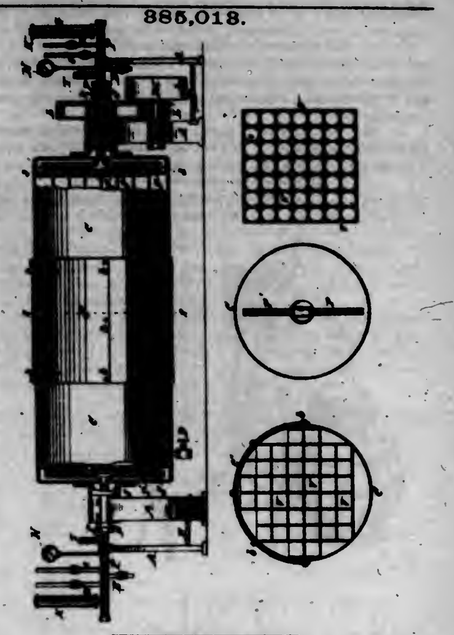
Claim.—1. In a stairway, the combination, with risers having vertical passages and vertical ways, and braces having horizontal and vertical portions and vertical passages, the vertical portions fitting said ways, of treads fitted beneath one riser and above the other and between the horizontal portions of the braces, and bolts fitted to the passages in the risers and the braces and arranged to bind the parts together.

2. In a stairway, the combination, with cast-metal risers having vertical passages and front and rear ways at each end, and cast-metal braces having vertical passages at their ends and horizontal portions, of cast-metal treads having grooves on the under side to receive the horizontal portions of the braces and fitted upon one riser and beneath the next riser, and bolts fitted to said passages and arranged to bind the parts together.



3. In a stairway, the combination, with risers having a vertical passage at each end and vertical front and rear ways, and braces having coincident passages and vertical and horizontal portions, the former portions fitted to said ways, of treads fitted upon one riser and beneath the other and between said braces, and shouldered rods fitted to said passages and having binding-nuts extended upward to form rounds, and railings secured thereto.

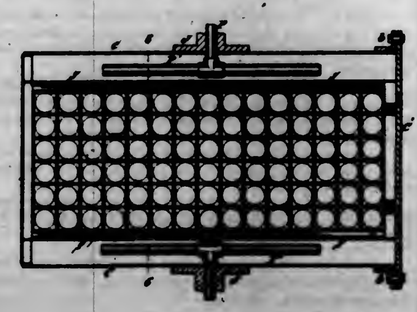
4. In a stairway, the combination, with the risers and treads, of separate blocks grooved in their upper surfaces to receive the lower edges of the risers and fitted between the latter and the treads, upper braces, and separate strips grooved to receive the lower portions of said braces and fitted between the braces and the treads, and fastening devices which secure the parts together.



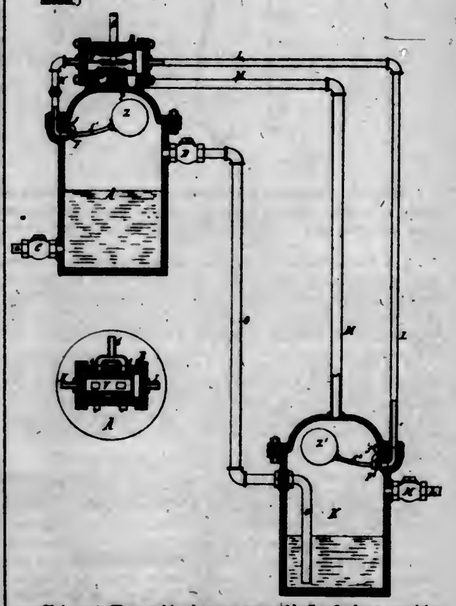
5. In a stairway, the combination, with the risers and the treads, of separate blocks fitted between the risers and treads and constructed to engage one of them to prevent accidental dislodgment of the blocks, upper braces, and separate strips fitted between the braces and the treads and constructed to engage one of them to prevent the accidental dislodgment of the strips, whereby the vertical measurement of the risers is increased and a stairway whose risers and treads are of predetermined sizes is made adjustable in length to fit a location somewhat longer than said stairway, and fastening devices which secure the risers, treads, and braces together, with the blocks and strips intervening, as aforesaid.

6. In a stairway, a cast-metal riser having a vertical passage at each end thereof and vertical ways at the front and rear sides of each end, substantially as described.

385,012.



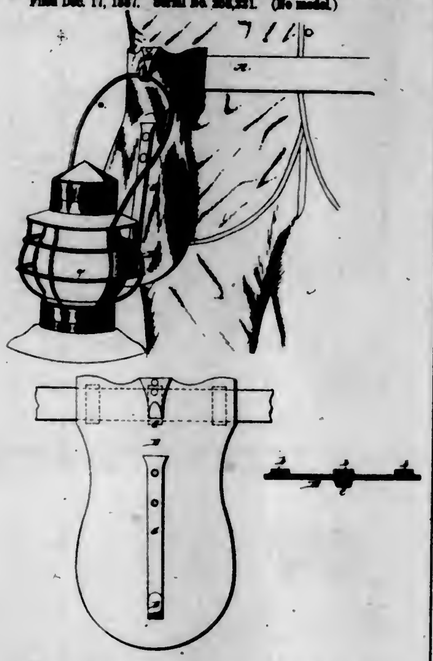
385,013.



385,013. MILK-PRESERVING MACHINE. GEORGE ROTH, Highland, Ill. Filed Oct. 15, 1887. Serial No. 252,503. (No model.)

Claim.—In a milk-preserving machine, the combination of the revolving cylinder C, provided with hollow journals, pipes P, passing through the ends of the cylinder, perforated pipes P', secured to the inner ends of pipes P and forming angles therewith, crates V, rigidly secured within the cylinder C, and screens S, located between the perforated pipes and crates, substantially as described.

385,014. STEAM-TRAP AND BOILER-FEEDER. WILLIAM SIMPSON, Richmond, Va. Filed Sept. 2, 1887. Serial No. 248,573. (No model.)



Claim.—1. The combined steam-trap and boiler-feeder, comprising in its construction a steam-chest on the receiver, having passages which place it in communication with the return drip-chamber, receiver, and steam-generator, and a hollow sliding piston-valve, V, which is wholly within the steam-chest and is constructed with passages v v^2 v^3, said valve being moved in said chest and serving itself to control the flow of live and exhaust steam by moving back and forth by reason of a

change alternately of the steam-pressure at its respective ends to atmospheric pressure, substantially as and for the purpose described.

2. The combination of the valve-chamber B, having ports P T U and sliding piston-valve V, the receiver A and drip-box K, a pipe, *c*, of a steam-boiler, and connections *i* L M N O S, and suitable valves, as P P', for operating with the same, substantially as and for the purpose described.

3. The valve-chamber B, having piston slide-valve V, in combination with the receiver A, drip-box K, float-valves P P', and pipes L N, substantially as for the purpose described.

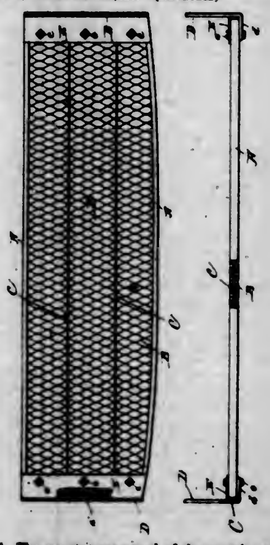
385,015. LANTERN-SUPPORTER. CHARLES SMITH, Rogers, Ark. Filed Dec. 17, 1887. Serial No. 258,231. (No model.)

Claim.—1. A lantern-holder comprising a waistband, a shield connected at its upper edge to said band, and the spring-hooks at the upper and lower ends of the shield for supporting the lantern, as set forth.

2. A lantern-holder comprising a shield provided at its upper edge, on its rear side, with loops *b*, a waistband inserted through said loops transversely to the shield, a hook at the upper end of the shield on its front face, to engage the bail of the lantern, and a hook at the lower end of the shield to engage the guard of the lantern, as set forth.

3. A lantern-holder comprising a shield having loops *b* on its rear side, at its upper end, a waistband inserted transversely through the said loops, the hook at the upper end of the shield to engage the bail of a lantern, and the hook at the lower end of the shield to engage the guard of a lantern, the said hook having a long shank secured to the shield to stiffen the same, as set forth.

385,016. MARINE SIGNAL. WILLIAM G. SPIESS, New York, N. Y., assignor of one-half to Sydney H. Carney, same place. Filed July 26, 1887. Serial No. 245,202. (No model.)



Claim.—1. The improved system for marine signals for ships and stations at sea, consisting of the said ships or stations, each provided with a sound-transmitter and a sound-receiver, the same being a bell or other metallic sounder adapted for being suspended at great depth and producing sounds under water, and a receiving-tube extending under water and having an approved funnel-shaped receiving-mouth thereunder therefor, and an ear-nozzle above—the one for transmitting sound to and the other for receiving sounds from another ship or station—substantially as described.

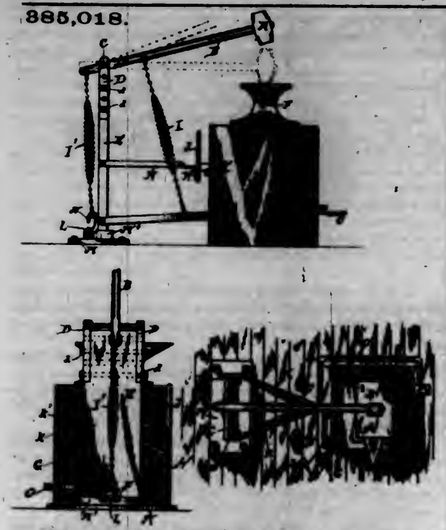
2. The improved system of marine signals for ships and stations at sea, consisting of the said ships or stations, each provided with a sound-transmitter and a sound-receiver, the same being a bell or other metallic sounder adapted for suspending at great depth and producing sounds under water, a receiving-tube extending under water—the one for transmitting sound to and the other for receiving sounds from another ship or station—and a call-signal or electric sounder connected with the receiver, substantially as described.

3. The combination, in a marine-signal apparatus, of a metallic sounder or bell adapted to be sounded under water from one ship or station, a receiving-tube in another ship or station, having an approved funnel-shaped receiving-mouth extending under water, and an ear-nozzle on the upper terminal, and also having a sound-transmitting diaphragm, said diaphragm being located above the water, substantially as described.

4. The combination, in marine-signal apparatus, of a metallic sounder or bell adapted to be sounded under water from one ship or station, a receiving-tube in another ship or station, having an approved funnel-shaped receiving-mouth extending under water, and an ear-nozzle on the upper terminal above the water, and also having a sound-transmitting diaphragm, also located above the water, and a call-signal, as an electric sounder, adapted to be set in action by the effect of the sound-waves on the diaphragm of the receiver, substantially as described.

385,017. CAR-STEP. FRANK H. STAFWOOD, Chicago, Ill. Filed Mar. 5, 1888. Serial No. 266,129. (No model.)

Claim.—1. The car-step composed of zigzag strips of sheet metal placed edge upward and side by side, transverse strengthening-rods, and a surrounding frame, in combination with hangers, substantially as specified.



2. The car-step composed of zigzag strips of sheet metal placed edge upward and side by side with their angles abutting, as described, and a suitable surrounding frame, in combination with hangers for suspending the step from the car, substantially as specified.

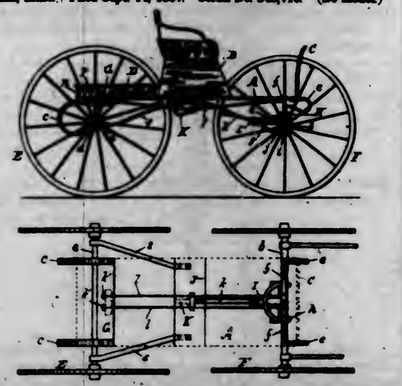
3. The combination of the strips B B, bent and positioned as described, the rods C, the frame A, and plates E, with the hangers D, substantially as specified.

4. The combination, with the reticulated step-body and its surrounding frame, of the plates E and hangers D, substantially as set forth.

385,018. SPRING-HAMMER FOR BLACKSMITHS. HENRY STEWART and WELLINGTON B. WINSALL, Longmont, Colo. Filed Apr. 30, 1888. Serial No. 272,391. (No model.)

385,018.

Claim.—1. The combination of the support, the hammer, the operating-lever for the hammer, the spring to throw up the hammer after the blow has been struck, and the spring-pitman, all substantially as described, and for the purpose set forth.



2. The combination of the hammer, the support therefor, its several connections with the floor, and means for adjusting the support so that the hammer may be thrown to strike on fuller or face of the anvil at will, as described.

3. The block M, the block M', swiveled therein, the standard or support E, secured in the block M' and carrying the hammer, the levers H and J, the block K K', and the foot-lever O, all in combination, substantially as described.

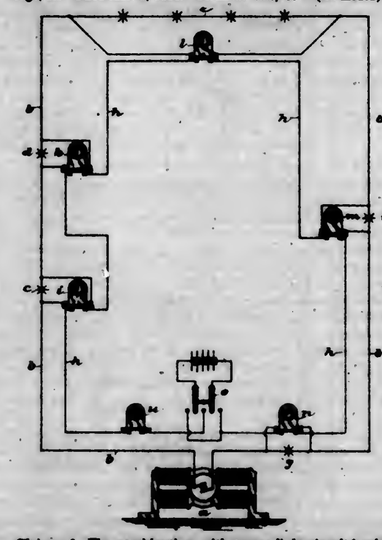
4. The combination of the standard E, carrying the hammer, the base-blocks M M', in which the standard is swiveled, the adjusting-lever H J, and the block K K', with the foot-lever O and the springs I I', all substantially as described, and for the purposes set forth.

5. The combination of a hammer, an adjustable support for the hammer, so that the hammer may be swung to deliver its blow at different points in a horizontal plane, a spring-pitman to operate said hammer, and a recoil-spring to throw up the hammer after each blow is given, substantially as described, and for the purposes set forth.

385,019. SPRING-VEHICLE. THOMAS L. SWEETSER, Framingham, Mass. Filed Sept. 14, 1887. Serial No. 249,714. (No model.)

Claim.—1. In vehicles, an elastic reach consisting of a buck-board and the springs whereby it is mounted on the axles, in combination with adjustable stay-rods which support said body and control its elasticity, substantially as set forth.

2. The combination of a buck-board and the vehicle-axles with springs, whereby said board is mounted on said axles, the axle stay-springs *j j k*, and the rod *l*, for regulating the elasticity of the buck-board, substantially as set forth.



3. In a vehicle, the combination, with front axle, *b*, the axle stay-spring *k*, the transom-bar H, with its cross-spring *f*, and the parallel side springs, *e e*, secured to the opposite ends thereof, of the elastic body A, secured by its front end to said springs *e e*, the parallel springs *e e*, which are attached to its rear, and the diagonal stay-springs *e e*, substantially as specified.

4. In running-gear for vehicles, the combination, with an elastic reach composed of the floor A, of the vehicle mounted upon parallel springs *e e e e* and secured by the diagonal rear stay-springs, *e e*, and the front stay-spring, *k*, of the adjustable stay-rods *l l*, longitudinally disposed and co-operating with the spring-bridge K, substantially as stated.

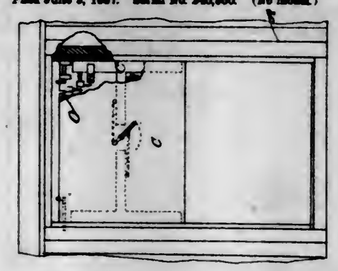
5. In combination with an elastic body of a vehicle, a flexible-sided box, D, substantially as set forth, composed of the top frame, *m*, secured to the body by points *n n*, and the flexible material *p*, which composes its sides, secured to said body, whereby the latter is free to bend, as and for purposes specified.

6. In vehicles, the combination, with an elastic body suitably mounted and secured to the axles, of the adjustable stay-rods *l l*, secured at front and rear longitudinally beneath said body, and the spring-bridge K, located midway of said body and co-operating with said stay-rods to control the elasticity of said body, as stated.

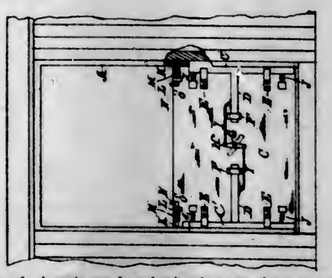
385,020. ELECTRIC-LIGHT SYSTEM. BERNARD E. SUNNY, Chicago, Ill. Filed Mar. 5, 1888. Serial No. 266,183. (No model.)

Claim.—1. The combination, with an arc-light circuit having the lamps thereon distributed at different stations, of an independent circuit containing individual electro-magnetic circuit-changing devices, said devices being distributed at different stations, a polarized electro-magnetic switch device connected with each individual electro-magnetic circuit-changing device, and included in a shunt-wire around a particular lamp or lamps, and a battery and pole-changing switch at the main station, whereby the lamp or lamps of any station may be brought into the arc circuit or disconnected therefrom, substantially as described.

2. The combination, with an arc-light circuit, including lamps arranged in series, of an independent circuit connected with an electro-magnetic circuit-opening mechanism at a particular station, a shunt-circuit around the lamp or lamps of said station, including the armature of an electro-magnetic switch, the electro-magnets of said electro-magnetic switch device being included in said independent circuit, a shunt-wire, *w*, normally closed around said coils, said shunt-wire being open at a particular period of time during the movement of the electro-magnetic circuit-opening mechanism, and the switch and battery at a central station, whereby the electro-magnetic switch may be operated when said shunt-wire is opened, as described.



3. The combination, with an electric-light circuit including lamps placed at different subscribers' stations, of an individual electric circuit extending from the central office through a circuit-opening mechanism placed at each of the different stations, and polarized electro-magnetic switch devices, one placed in connection with the shunt-



wire around the lamp or lamps of each station and the individual circuit-opening mechanism of said station, and a battery and pole-changing switch at the central station, whereby during the simultaneous operation of the various individual circuit-opening devices the lamp or lamps of any station may be brought into circuit or disconnected therefrom, substantially as described.

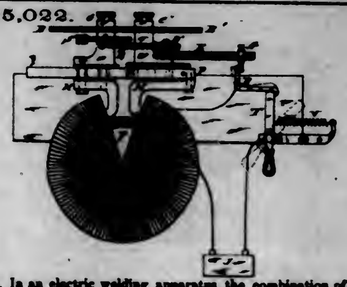
4. The combination, with a circuit including an individual circuit-opening mechanism, of means for throwing current of opposite polarities thereon, and an electro-magnetic switch included in said circuit and a shunt-circuit around the electric arc-lamp which is opened or closed by said electro-magnetic switch accordingly as current of one polarity or the other is sent to line.

5. The combination, with a circuit including an individual circuit-opening mechanism, of means for throwing current of opposite polarities thereon, and an electro-magnetic switch included in said circuit, and a shunt-circuit around an electric illuminating device included in the electric-light circuit, said shunt-circuit being opened by the electro-magnetic switch when current of one polarity is sent over the independent circuit, and closed thereby when current is sent in the opposite direction over said independent circuit, substantially as and for the purpose specified.

385,021. GRAIN-CAR DOOR. ABRAHAM R. TAYLOR, Cincinnati, Ohio. Filed June 9, 1887. Serial No. 240,800. (No model.)

Claim.—1. A grain-car door having between the interior and exterior faces a pair of movable cleats, arms D, rods I, and cross-arm H, for operating said cleats, combined with a grooved frame for receiving the cleats and springs for holding said strips or cleats in a normal position, substantially as and for the purposes set forth.

2. In a removable car-door, the combination of the interior and exterior faces provided with vertical movable cleats adapted to be forced into and withdrawn from grooves in the door-frame by means of the arms D, rods I, and cross-arm H, with pivoted hinges Q, and suitable staples or pins on the door-frame to receive the eyes of said hinges, whereby the door may be swung around against the inside of the car, substantially as shown and described.



3. In a car-door, C, sliding between the frame-jambs and having notches O, provided at its upper end with sliding bolts K, secured in suitable keepers, L, and having extensions N and coiled springs M on each, whereby said bolts can be used to lock the door and as pivots when the door is swung up against the car-roof.

385,022. APPARATUS FOR ELECTRIC WELDING. ELIHU THOMSON, Lynn, assignor to the Thomson Electric Welding Company, Boston, Mass. Filed July 25, 1887. Serial No. 245,126. (No model.)

Claim.—1. In an electric welding apparatus, the combination, with a movable clamp, of mechanism controlled thereby to cut off the welding-current at a predetermined point, as and for the purpose described.

2. In an electric welding apparatus, the combination of clamps for holding the pieces to be welded, and mechanism controlled by the movement of one or both of the clamps to cut off the welding-current at a predetermined point, substantially as specified.

385,022.

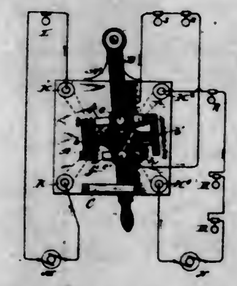
3. In an electric welding apparatus, the combination of clamps for holding the pieces to be welded and adjustable cut-off mechanism controlled thereby to cut off the welding-current at a predetermined point, substantially as specified.

4. In an electric welding apparatus, the combination of clamps for holding the pieces to be welded and conveying the current therethrough and an adjustable cut-off mechanism actuated thereby for cutting off the welding-current from said clamps at a predetermined point, substantially as specified.

5. In an electric welding apparatus, the combination of a movable slide, a clamp mounted thereon, an adjustable stop or equivalent device mounted on said slide, and circuit-controlling devices actuated by said adjustable stop to cut off the welding-current at a predetermined point, substantially as specified.

6. In an electric welding apparatus, the combination of a movable slide, a clamp mounted thereon, an adjustable stop mounted on said slide, a detent actuated by said stop to open a switch to cut off the welding-current at a predetermined point, substantially as specified.

7. In an electric welding apparatus, the combination, with a movable clamp or clamps, of a switch-actuating device controlled thereby for cutting off the welding-current at a predetermined point.



8. In an electric welding apparatus, the combination of a movable clamp or clamps, switching mechanism for cutting off the welding-current, and switch-actuating mechanism controlled by said movable clamp to actuate the switch at a predetermined point.

9. In an electric welding apparatus, the combination of a fixed clamp, a sliding piece moving toward and away from said clamp, a clamp mounted on said slide, and a spring or equivalent device tending to force said clamps together, substantially as specified.

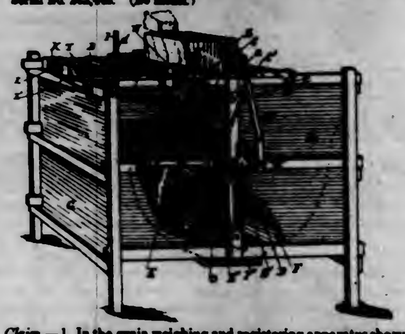
10. In an electric welding apparatus, the combination of a fixed clamp, a sliding piece, a clamp located thereon, a spring tending to force said clamps together, and means for adjusting the tension of said spring, substantially as described.

11. In an electric welding apparatus, the combination of a movable clamp, mechanism controlled thereby for cutting off the welding-current at a predetermined point, and means for varying the amount of current fed to the apparatus, substantially as described.

385,023. ELECTRIC SWITCH. PATRICK J. TRACY, Easton, Wis. Filed Mar. 23, 1887. Renewed May 17, 1888. Serial No. 274,197. (No model.)

Claim.—1. The combination, with two electric generators, of a switch-board supporting the terminals of the generator-circuits, and a switch-arm carrying a bridge for each pair of terminals, and also conducting-strips which form the terminals of a loop-circuit containing translating devices, the arrangement of the parts being such that when one pair of terminals is bridged the other pair will be in contact with the conducting-strips, whereby the loop can be cut out of the circuit of one generator and into that of the other at will.

2. The combination, with the generators M and N, their circuits,



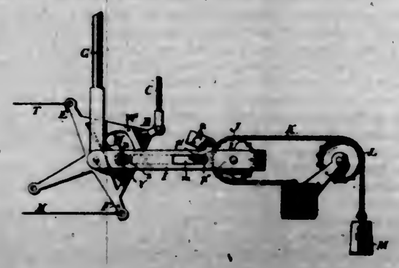
and the circuit-terminals *i i'* and *j j'*, of the switch-lever B, the loop-circuit connected therewith, the binding-posts *e e'*, the strips *f f'*, and bridges *d d'*, whereby the loop can be switched into and out of either circuit at will.

3. The combination, with a loop-circuit containing translating devices and a switch carrying the loop-terminals, of a cut-out, as *h h'*, for making a direct connection between the terminals, as set forth.

4. The combination, with a moving contact-terminal, of a cleaner or polisher located in the path of motion of the said terminal, the said cleaner being elastically supported, as and for the purpose set forth.

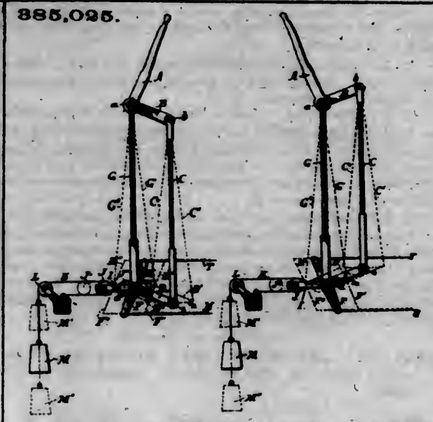
5. In an electric switch, the combination, with the switching-lever having bridge-pieces, as described, and a spring-supported cleat tending to force the lever toward contact-pieces, of contact-pieces provided with springs to force them toward the lever, whereby the contacts are continually pressed toward each other to insure good connections, substantially as described.

385,024. AUTOMATIC GRAIN WEIGHING AND REGISTERING APPARATUS. LE ROY C. TAYLOR, Marseilles, Ill. Filed Jan. 30, 1888. Serial No. 262,443. (No model.)



Claim.—1. In the grain weighing and registering apparatus shown and described, the combination of the oscillating buckets B E, shaft S, having the slotted arm D and crank-leg Z, connecting-rod D', having the friction-roller *a'*, scale-beam A, weight W, oscillating chute S, shaft C, having the arm C', and connecting-rod M', substantially as and for the purpose set forth.

2. In the grain weighing and registering apparatus shown and described, the combination of the oscillating buckets E E', shaft S', having the slotted arm D, connecting-rod D', having the friction-roller *a'*, scale-beam A, weight W, bell-crank B, having the gravity-latch *d*, and connecting-rod for connecting said bell-crank with a registering device, substantially as and for the purpose set forth.



3. In the grain weighing and registering apparatus shown and described, the combination of the oscillating buckets E E', a grain-chute connected therewith and adapted to oscillate alternately to conduct grain to either bucket, and a scale-beam adapted to be overcome by the weight of the grain in a bucket, substantially as and for the purpose set forth.

4. In a grain weighing and registering apparatus, in combination with the oscillating buckets E E', and oscillating chute S, connected therewith and adapted to operate simultaneously in a reverse direction therefrom, the scale-beam A, and the mechanism, substantially as set forth, for connecting said beam and buckets, wherein the grain passing through said apparatus is automatically weighed, substantially as specified.

385,025. SIGNAL-COMPENSATOR. JAMES J. TURNER, Richmond, Ind., assignor to himself and John F. Miller, same place. Filed Jan. 24, 1888. Serial No. 261,610. (No model.)

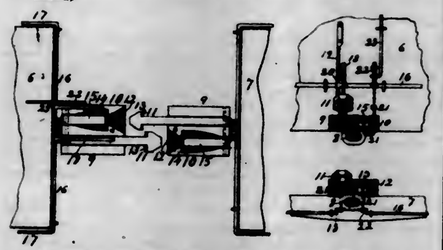
385,025.

Claim.—1. In a compensator, the combination of a pivoted operating-lever, rods of equal length suspended, respectively, from the pivot and the extremity of one arm of said lever, a double-bell-crank lever having its central arm of equal length to the arm of the operating-lever, from which the rods depend, said bell-crank being suspended centrally on the rod depending from the pivot of the operating-lever and at the end of its central arm on the other rod, a weight arranged to connect with the center of the bell-crank and pull it in the direction opposite to that of its attached connections, and parallel signal-connections attached to the outer arms of the bell-crank.

2. In a compensator, the combination of a pivoted operating-lever, rods of equal length suspended, respectively, from the pivot and the extremity of one arm of said lever, a double-bell-crank lever having its central arm of equal length to the arm of the operating-lever, from which the rods depend, said bell-crank being suspended centrally on the rod depending from the pivot of the operating-lever and at the end of its central arm on the other rod, a strap pivoted at the center of the bell-crank lever and forming bearings for a pulley, a ratchet-wheel secured on one side of said pulley, a pawl arranged to engage the ratchet-wheel and secured to a connecting device, whereby said pawl will be engaged with and disengaged from the ratchet-wheel, according to the position of the bell-crank lever, a weight arranged to draw on the bell-crank by means of a cord passing over the pulley aforesaid, and signal-connections attached to the outer arms of the bell-crank and running in a direction opposite to the pull of the weight.

3. In a compensator, the combination of a pivoted operating-lever, rods of equal length suspended, respectively, from the pivot and the extremity of one arm of said lever, a double-bell-crank lever having its central arm of equal length to the arm of the operating-lever, from which the rods depend, said bell-crank being suspended centrally on the rod depending from the pivot of the operating-lever and at the end of its central arm on the other rod, a strap pivoted at the center of the bell-crank lever and forming bearings for a sprocket-pulley, a ratchet-wheel secured on one side of said pulley, a pawl arranged to engage the ratchet-wheel and secured to a connecting device, whereby said pawl will be engaged with and disengaged from the ratchet-wheel, according to the position of the bell-crank lever, a sprocket-chain passing over the sprocket-pulley, a weight attached to said chain, and parallel signal-connections attached to the outer arms of the bell-crank lever and extending in a direction opposite to the pull of the weight.

385,026. WINDING-ROLL FOR WINDING PAPER AND OTHER FABRICS. JOHN WALDRON, New Brunswick, N. J. Filed July 30, 1887. Serial No. 245,474. (No model.)



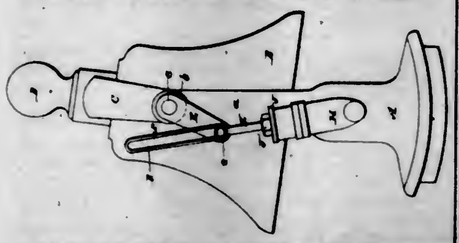
Claim.—1. The combination, to form a winding-roll, of a shaft, a slitted shell of elastic material, and a pair of spreading-heads, substantially as set forth.

2. The combination, to form a winding-roll, of a shaft, a slitted shell of elastic material, a pair of spreading-heads, and a fastening-pin, substantially as set forth.

3. The combination, to form a winding-roll, of a winding-shaft, two spreading-heads fitted for endwise movement upon said shaft and having oppositely-tapering faces, and a longitudinally-slitted shell of elastic material adapted to be diametrically expanded by forcing into it the tapering faces of the spreading-heads, and mounted upon the shaft, substantially as set forth.

4. The combination, to form a winding-roll, of a winding-shaft, two spreading-heads fitted for endwise movement upon said shaft and having oppositely-tapering faces, a longitudinally-slitted shell of elastic material adapted to be diametrically expanded by forcing into it the tapering faces of the spreading-heads, and mounted upon the shaft, and a fastening-pin applied to the heads and passing through the expanded slit of the shell, substantially as set forth.

385,027. CAR-COUPLING. JOHN R. WARD and JOHN A. FALCATTER, Huron, Dak. Filed Mar. 20, 1888. Serial No. 268,745. (No model.)



Claim.—The combination, in a car-coupling, of a draw-head provided with the box 10, having the slanting cheeks 12 and the shoulders 14 behind the cheeks, and the box 9 beside the box 10, the link 11, hung in the box 9 and having an arrow-shaped head with shoulders 13, adapted to engage the said shoulders 14 of the box 10, the lifting-bar 16, journaled across the end of the car and provided with levers or handles 17 at the sides of the car, and further provided with two arms, 18 and 22, the guard 15, journaled in the box 10, the lifter consisting of the rod 21, passing up through the bottom of the box 10 beneath the guard, and connections between the said rod and the arm 22 and between the said arm 18 and the link 11, substantially as shown and described.

385,028. ELECTROLYTE FOR GALVANIC BATTERIES. BLOOMFIELD J. WHEELOCK, New York, N. Y. Filed Oct. 26, 1887. Serial No. 253,056. (No specimens.)

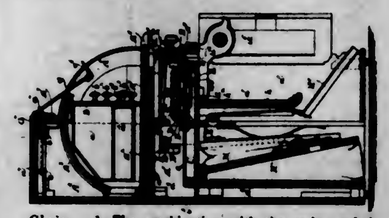
Claim.—1. The herein-described composition of matter to be used in primary batteries, consisting of nitric acid, sulphuric acid, pure water, sal-ammoniac, bichromate of potash or bichromate of soda, and sulphate of iron, substantially as and for the purpose set forth.

2. The combination of carbon and zinc elements with a composition of matter consisting of nitric acid, sulphuric acid, pure water, sal-ammoniac, bichromate of potash or bichromate of soda, and sulphate of iron, substantially as described, and for the purpose set forth.

385,029. BELL-RINGING MECHANISM. JOHN S. WHITE, Logansport, Ind. Filed Oct. 12, 1887. Serial No. 252,161. (No model.)

Claim.—1. In a bell-ringer, the combination, with a base or support and a bell journaled thereon and provided with a crank, of an oscillating cylinder, a piston therein, and a rigid piston-rod having a sliding connection with the crank, substantially as set forth.

2. In a bell-ringer, the combination, with a base and a bell journaled thereon and provided with a crank, of an oscillating engine, the two pistons therein loosely connected together, and the rigid piston-rod having a sliding connection with the crank, substantially as set forth.



3. The combination, with a bell journaled on a suitable standard, of an oscillating engine having large and small cylinders and large and small pistons, the large piston having a hollow bore and a hollow plug therein, and the latter having a stem adapted to enter the large piston to be held therein, and a supply-duct leading into the smaller cylinder at a point between the large and small pistons, and a rigid piston-rod attached to the larger piston, and having a sliding connection with the bell-crank, substantially as set forth.

385,030. PINCHERS. WILLIAM R. WHITE, Lynn, Mass., assignor of one-half to Joseph M. Rosado, same place. Filed Mar. 12, 1888. Serial No. 266,954. (No model.)

Claim.—A pair of pinchers having a broad flat-faced projection upon one of the jaws thereof, which projection is provided with a central screw-threaded socket, combined with a removable disk provided with a cylindrical shank fitted to said socket, so that the inner face of said disk is in close contact with the face of said projection.

385,031. COMBINED DESK AND ORGAN. OLE R. WICK and GEORGE C. WICK, Humboldt Park, Ill. Filed Apr. 5, 1887. Serial No. 233,703. (No model.)

Claim.—1. The combination, with the casing and the keys of an organ, of a rigid horizontal sliding top located over and adapted to cover the keys and to form a desk-top when drawn forward, and a separate vertically-sliding panel at the front of the case, adapted to be lifted for closing the space in front of the keys and beneath the sliding top when the latter is in its forward position, and to be lowered to expose the keys when the top is thrust backward, substantially as described.

2. The combination, with an organ mechanism embracing keys and stop-valves, of a casing provided with a horizontal sliding top adapted to be drawn forward over the keys and thrust backwardly to uncover the said keys, a series of organ-stops located in the casing above the level of the sliding top at either side of the same, and operative connections joining the said stops with the stop-valves, substantially as described.

3. The combination, with an organ mechanism, of a casing provided with a horizontal top, the front part of which is adapted to be opened and closed for uncovering the keys of the organ, a shallow chamber, A^2, located in the top part of the casing beneath the said horizontal top and containing the main operative parts of the organ mechanism, receptacles A^0 A^1, occupying the side portions of the casing beneath the said chamber A^2, and a central chamber, A^4, containing the bellows of the organ, substantially as described.

4. The combination, with an organ mechanism embracing keys and stop-valves, of a casing having a flat horizontal sliding top, a shallow chamber, A^2, containing the main parts of the organ mechanism, located beneath said horizontal top, a hood located above the level of the horizontal top, a series of stops supported in the hood above and at either side of the horizontal top, and connecting devices between the said stops and the stop-valves, substantially as described.

5. The combination, with a casing provided with a horizontally-movable or sliding top, of an organ mechanism embracing stop-valves located beneath said sliding top, a series of stops located one above another at one side of and above the level of said sliding top, and vertical connections extending from the said stops downwardly to the stop-valves.

6. The combination, with the stop-valves of an organ, of a vertical sliding rod or wire, as L, connected with the stop-valve and provided with transverse parts or surfaces, as *l l*, formed by a series of reversed right-angled bends in the wire, and stop-draws located one above another and provided with inclined edges or surfaces engaging said transverse parts or surfaces of the rod, substantially as described.

7. The combination, with the stop-valves of an organ, of a vertical sliding rod or wire, as L, connected with said stop-valve and provided with two or more transverse parts or surfaces *l l*, formed by a series of reversed right-angled bends in the wire, and stop-draws located one above another and provided with inclined parts or surfaces acting upon said transverse parts *l l* of the rod, one of said parts or inclined surfaces being constructed to move the rod a greater distance than the other one, substantially as described.

8. The combination, with the stop-valves of an organ, of two or more vertical sliding rods, L L', provided with a series of right-angled bends forming transverse parts *l l* l^1 l^1, connected with and actuating the said stop-valves, stops acting upon the parts *l l* l^1 l^1 of said rods, a rock-shaft provided with a crank-arm engaging transverse parts l^1 l^1 of said rods for moving both of them at once, and means connected with and actuating said rock-shaft, substantially as described.

9. The combination, with the stop-valves of an organ and a series of stops located one above another above the level of the stop-valves, of two or more vertical sliding rods, as L L', connected with said stop-valves and provided with transverse parts or surfaces, as l^1 l^1, a rock-shaft provided with a crank-arm engaging the said transverse parts or surfaces of the rods, and means for actuating said rock-shaft, substantially as described.

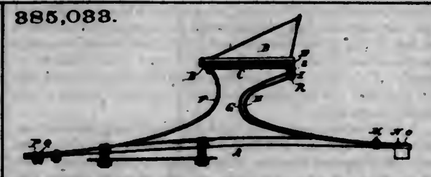
10. The combination, with an organ frame or casing and stop-valves, of two or more vertical rods, as L L', located at each end of the organ for actuating the said rods, said rods being provided with transverse parts or surfaces, as l^1 l^1, stops connected with and actuating said rods, rock-shafts provided with crank-arms engaging the transverse parts of said rods, a rod, N, connected with and actuating both rock-shafts, and a knee-lever connected with and actuating said rod N, substantially as described.

11. The combination, with an organ-casing provided with a horizontally-sliding top located over the keys and with a vertically-sliding panel located at the front of the keys, beneath and adjacent to the said top for closing the space at the front of the keys, of means connecting the said top and panel, whereby the latter will be raised to close the casing when the top is drawn forward and lowered to open the casing when the top is thrust back, substantially as described.

12. The combination, with the organ-casing, the sliding top A', and sliding panel A^1, of a lever pivoted to the casing and engaged with the sliding panel, and pins or projections upon the sliding top engaging said lever, substantially as described.

13. The combination, with the organ-casing provided with a horizontal sliding top and an organ mechanism located beneath the top, of a stationary wall or panel, a^{10}, located beneath the said sliding top, substantially as described.

14. The combination, with an organ-casing provided with a top or hood, A^3, of a music-rack, O, and a horizontally-sliding support, O', hinged to the rack and fitted to slide in a recess in the upper part of said hood, substantially as described.



15. The combination, with an organ mechanism, of a casing therefor consisting of a main part or body provided with a sliding top, A', and with a hood, A^3, above said top, organ-stops located in the said hood, and a cylinder or rolling cover, A^3, located to close the front opening of the hood, substantially as described.

385,032. FIRE-CRACKER HOLDER. AMBROSE WILLIS, Troy, N. Y., assignor of one-half to Theodore D. Robinson, same place. Filed Apr. 19, 1888. Serial No. 271,150. (No model.)

Claim.—A fire-cracker holder consisting of a body provided with a cylindrical perforation therein, a conical breech perforation at one end, and a touch-hole axially in the rear of said perforation, the size of said hole being such as to be closed by the fuse of a fire-cracker, substantially as and for the purpose described.

385,033. SPRING-SEAT FOR VEHICLES. LEWIS WARREN, Mo-Grawville, N. Y. Filed July 9, 1887. Serial No. 243,988. (No model.)

Claim.—1. In a spring-seat of a side-bar vehicle, the combination of the seat or seat-frame, the front springs—serving as springs and supports—made of spring-bars of wood or metal, the hind springs made of two or more separate metal springs, suitably shackled or pivoted to the seat or seat-frame and fastened or attached at their rear ends to the side bars, so as to be in contact at said rear ends, but separating at a suitable point at or above the side bars, and the side bars of the vehicle, substantially as shown and described, for the purposes hereinbefore set forth.

2. In a side-bar vehicle, the combination, with the seat and side bars, of the front and rear springs, each composed of two leaves secured at different points to shackles attached to the seat and to the side bars by means of suitable clips, substantially as specified.

385,034. ELECTRO-MOTIVE RAILWAY. GRANVILLE T. WOODS, Cincinnati, Ohio, assignor to the Woods Electric Company, same place. Filed Aug. 23, 1888. Serial No. 311,662. (No model.)

Claim.—1. The combination, in an electric railway, of an outgoing and incoming conductor constituting a closed metallic circuit, the outgoing conductor being divided into two branches and having resistances interposed in opposite branches at successive intervals, normally-closed switches connecting said branches at the generator side of said resistances, adapted to be opened automatically by the passage of the motor-contacts, and locomotives forming traveling contact-bridges between the two branches of the outgoing conductor in the intervals of such resistances, and operated by the excess of current passing from the branch of greater to the branch of lesser resistance, substantially as set forth.

2. In an electro-motive railway, a closed metallic circuit, the outgoing portion of which consists of two continuous parallel branches in sections or blocks having resistances interposed in opposite branches at successive block-junctions, and a normally-closed switch connecting opposite branches at the beginning of each block, in combination with locomotives forming traveling contact-bridges between said branches, and means, substantially as described, for causing the locomotive-contacts to open said switches automatically in succession, thereby alternating the resistances of the branches and shunting the excess of current from one to the other, substantially as and for the purpose set forth.

3. The combination, in an electro-motive railway, of a double outgoing conducting-path in parallel branches of the same polarity, but of unequal resistances, arranged in successive blocks, and electric motors having traveling contacts electrically bridging said branches and in series with each other upon successive blocks, and normally-closed switches connecting the branches at the generator side of said resistances, adapted to be automatically opened by the passage of the motor-contacts, substantially as set forth.

4. The combination, in an electro-motive railway, of an outgoing conducting-path composed of two parallel branches having resistances interposed alternately at predetermined intervals in said branches, with electrically-operative normally-closed switches controlled by

magnets connecting said branches in the intervals between said resistances, said switches being in normally-open loop-circuits formed in each case by one of said branches, and a third independent conductor adjacent to and parallel therewith, and adapted to be closed by an extension of the locomotive traveling contact bridging between said third conductor and its adjacent branch of the main conductor, substantially as set forth.

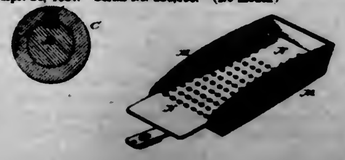
5. In an electro-motive railway, a double outgoing electrical conducting-path of the same polarity divided into blocks of predetermined length, the respective branches of said conductor crossing each other at the junctions of successive blocks, so as to be out of contact with the motor-brushes, and provided alternately with high resistances at said crossings, and normally-closed switches controlled by the motor-contacts connecting the opposite branches, substantially as set forth.

6. The combination, in an electric railway, of a conductor-conduit constructed and arranged as described, two parallel outgoing conductor-branches secured therein in sheltered positions beneath the overhanging roof-sides, and a return-conductor arranged at or near the bottom of the conduit, substantially as set forth.

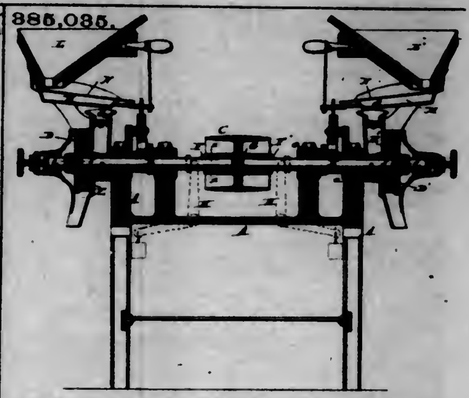
7. The combination, in an electric railway, of the motor-supporting rails and an open-slotted conduit parallel therewith upon or in the roadway, two bared parallel conductors within said conduit, adapted to maintain sliding contact with the traveling motor-brushes, said conductors being insulated from each other and from other conductors (such as return-conductors) and the conduit and conduit and carrying electric currents in the same direction, and a third conductor within said conduit arranged as a common return to complete a continuous metallic circuit with the first-mentioned conductors, substantially as set forth.

8. In an electro-motive railway, in combination with the two branches of a divided current-conductor, a connecting-shunt and a magnet for operating the same in a normally-open loop-circuit with one of said branches, a portion of which said loop-circuit is formed by a conductor laid parallel with said main conductor-branch, so as to be temporarily closed by the traveling contact-brush of the electro-motor, substantially as set forth.

9. In combination with an electro-motive railway such as described, a connecting-railway or "side track" having an electrical conducting-path constructed and arranged in the same manner—that is to say, with an outgoing conductor divided into two parallel continuous branches of the same polarity and a return-conductor, said outgoing and return conductor being looped into one branch of the outgoing conductor of the main line, substantially as set forth.



10. In combination with an electro-motive railway having an outgoing conducting-path in two parallel continuous branches of the same polarity and arranged in successive blocks, as described, whereby locomotives upon a block are in series with those of another block, a side track or connecting-railway having a similarly-arranged conducting-path and locomotives upon one of its blocks in series with those upon other blocks, substantially as set forth.

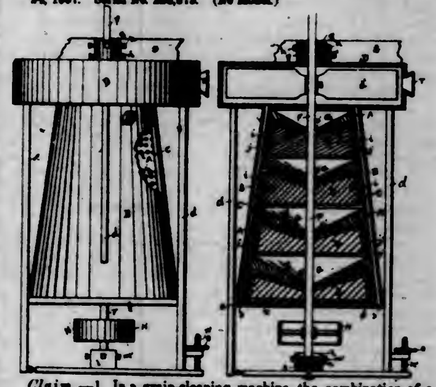


11. In combination with an electro-motive railway having an outgoing conducting-path in two parallel continuous branches of the same polarity, arranged in successive blocks, as described, whereby locomotives upon a block are in series with those of another block, a side track or connecting-railway electrically connected with the main line by means of a switch and similarly arranged, whereby electric motors upon the several blocks of the side track are in series with those upon other blocks of the same and with those of the main line, substantially as set forth.

12. In combination with an electric railway having an outgoing conducting-path composed of two members of the same polarity, a side track or branch looped into said main outgoing conductor, one side of said loop being the branch outgoing conductor and the other or return side of said loop being composed of two parallel branches of unequal resistances, and motors on said side track provided with brushes bridging said return branches of the loop, substantially as set forth.

13. An electric railway having a conducting-path such as described, combined with a side track or branch railway having a conducting-path looped in the main outgoing conductor, an independent generator interposed in the outgoing side of said loop, and a double or "two-way" switch, arranged substantially as and for the purpose set forth.

385,035. GRINDING-MILL. MILO J. ALTHOUSE, Waupun, Wis. Filed Apr. 26, 1887. Serial No. 236,193. (No model.)



Claim.—1. In a double grinding-mill, and in combination with the divided shaft provided with grinding-disks at its ends, the driving-pulley having the sliding connection with one or both parts of the shaft, and the spring or its described equivalent acting to urge the two portions of the shaft apart.

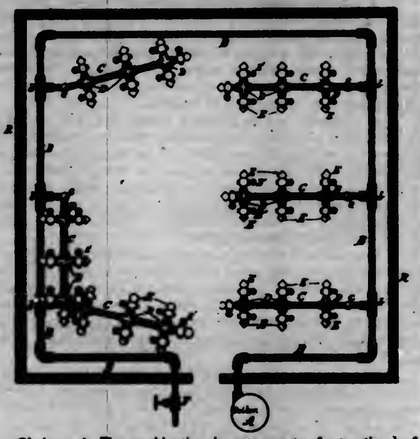
2. In a double grinding-mill, the transversely-divided shaft, the intermediate spring, and the driving-pulley encircling the ends of both shaft-connections and coupled thereto by a sliding connection, substantially as described.

385,036. GRAIN-CLEANER. JOSEPH S. ASH, Canal Winchester, Ohio, assignor of one-half to Charles B. Crowe, same place. Filed Feb. 24, 1887. Serial No. 228,679. (No model.)

Claim.—1. In a grain-cleaning machine, the combination of a series of revolving concave disks, *b*, having removable rubbing-surfaces on their upper sides and brushes on their peripheries, with the conical case A, having dust-perforations, and stationary concave disks between each pair of brush-covered concave disks, and having rubbing-surfaces on their under sides, substantially as and for the purposes specified.

2. The combination of a series of concave disks, *a*, having rubbing-surfaces on their under side, and a series of revolving concave disks, *b*, having rubbing-surfaces on their upper sides and brushes on their peripheries, with the outer conical case, B, having perforations *p* in the base thereof, and the inner conical perforated case, A, having horizontal corrugations *j* therein between the rows of perforations, substantially as and for the purposes described.

385,037. DUST-COLLECTOR. JOSEPH S. ASH, Canal Winchester, Ohio, assignor of one-half to Charles B. Crowe, same place. Filed June 10, 1887. Serial No. 240,892. (No model.)



Claim.—1. In a dust-collector, the combination of a cylindrical box having a conical bottom and an opening, *c'*, in the bottom thereof, a top plate, *c*, having a central vertical pipe, *d*, therein and an opening, *h*, on one side of said pipe, an interior wall forming an annular chamber, *d*, around said central pipe, and a lateral inlet-spout, *b*, leading into said annular chamber, the outer wall of said chamber having vertical slots, and a curved slotted damper held against said wall and controlled substantially as described.

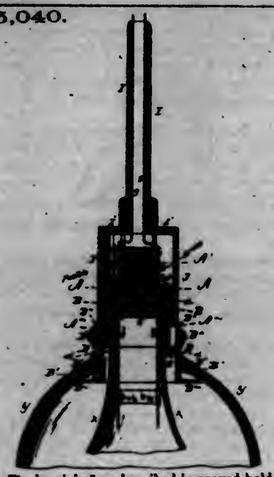
2. In a dust-collector, the combination of a cylindrical box having a conical bottom and an opening, *c'*, in the bottom thereof, a top plate, *c*, having a central vertical pipe, *d*, therein, an interior wall forming an annular chamber, *d*, around said central pipe, and a lateral inlet-spout, *b*, leading into said annular chamber, the outer wall of said chamber having vertical slots and inwardly-projecting wings *g*, and a curved slotted damper held against said wall, substantially as described.

3. A dust-collector consisting of a cylindrical box having a top plate, a conical bottom, a central vertical pipe therein, an interior wall forming an annular chamber, *d*, around said central pipe, and a lateral inlet-spout leading into said cylindrical box and into said chamber *d*, the outer walls of said chamber *d* having vertical slots, and a curved slotted damper loosely held against said wall and provided with arms projecting through curved slots in said top plate for actuating said damper.

385,038. APPARATUS FOR TREATING LEAF-TOBACCO. GEO. W. BROOKS, Mahaska, N. C. Filed Apr. 4, 1888. Serial No. 269,594. (No model.)

Claim.—1. The combination, in an apparatus for treating leaf-tobacco, with a steam-boiler and a closed room, of a main line of pipe from said boiler extending around the room adjacent the walls thereof, made in sections, a series of branch pipes projecting laterally from and hinged or jointed to said main pipe, and a series of steam-distributers projecting laterally from said branches, substantially as described, for the purposes specified.

2. The combination, in an apparatus for treating leaf-tobacco, with the boiler A, of the main line of pipe B B, a series of short pipes, C, extending laterally from the main pipe B and having a hinged connection therewith, and a series of distributers, E, extending laterally from the branch pipes C and supplied with cocks or spigots F, substantially as described, for the purposes specified.



3. In an apparatus for treating leaf-tobacco, the distributers E, having cocks or spigots F, formed with a perforated nozzle, *e*, having an interior cup-shaped recess, *e'*, and water-outlet *e''*, substantially as described, for the purposes specified.

385,039. HOLDER FOR INCANDESCENT LAMPS. WILLIAM A. CAREY, Malden, Mass. Filed Aug. 26, 1887. Serial No. 247,843. (No model.)

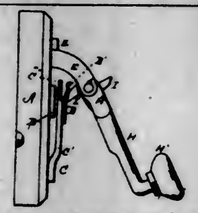
Claim.—1. In an incandescent-lamp holder, the core consisting of the central cylindrical portion, A, the upper portion, A', provided with the opposite parallel flat sides A'', and the lower ball-shaped portion, A''', provided with suitable perforations for the passage of the wire from the filament, said core being constructed in a single piece, substantially as and for the purpose set forth.

2. The combination of the core A A', tube B B', provided with the shoulder B'', case J, independent of the means whereby the lamp-holder is suspended and free to move vertically on said core and tube, and annular base I, substantially as and for the purpose described.

385,040.

3. The hereinbefore-described improved holder or socket for incandescent lamps, consisting, essentially, of the core A A' A''', provided with the flattened sides A'', the bar E and fusible bar H, screws *e f*, tube I and base I', tube B B', provided with the shoulder B'', flange B''', and spiral groove C, the shade-clamp D, provided with the flange D', serrated portion D'', and guides *d*, and the case J, substantially as and for the purpose described.

385,040. LUBRICATOR. WILLIAM A. CAREY, Malden, Mass. Filed Sept. 6, 1887. Serial No. 249,092. (No model.)



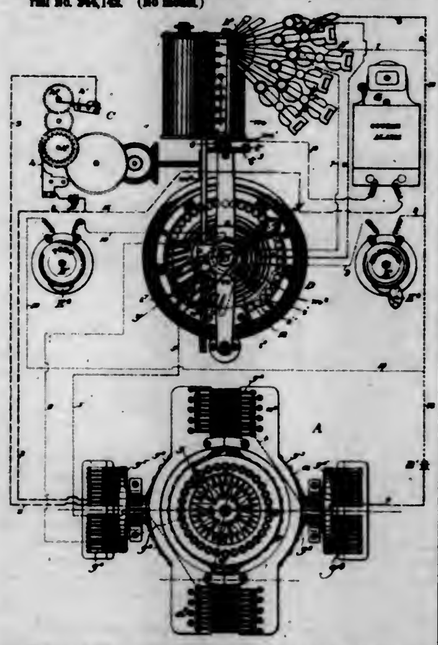
Claim.—1. In a lubricator, the combination, with a reservoir and a valve held normally therein on its seat, of the reservoir-cover C, provided with the central depression, C', surrounding the perforation C'', said depression being provided on its bottom with the perpendicular radial teats or beads *d*, and the cap H, provided on its under side with the radial grooves *h*, of less depth than the thickness of said teats or beads, and the radial grooves *k*, of as great as or greater depth than said teats or beads, said cap being adapted by rotation to raise said valve-stem and allow the lubricant to escape from the reservoir, substantially as and for the purpose set forth.

2. The combination of the reservoir, consisting of the base A, provided with the passage *a*, tube E, and passage E', sides B and cover C, provided with the tube D, depression C', perforation C'', and teats *d d*, the tubular cap H H', provided on its under side with the radial grooves *h h k k*, the two former being of less depth, and the two latter of as great or greater depth than the thickness of said teats, and the tubular valve-stem I, held normally down upon its seat, so as to close said passage *a*, and provided with the perforations *e e*, said valve-stem being held by a check-nut, so as to move with the said cap as the latter rotates and rises, substantially as and for the purpose described.

385,041. SWITCH FOR ELECTRICAL PURPOSES. WILLIAM A. CAREY, Malden, Mass. Filed Sept. 10, 1887. Serial No. 249,314. (No model.)

Claim.—1. In an electrical switch, the combination, with a spring adapted by pressure to close the circuit of the frame K, wheel I, pivotally mounted therein, and whose teeth are provided with rounded or beveled ends, as shown, and bifurcated actuating-lever H, longitudinally chambered out at A, and provided with the spring-bolt K,

385,041.



whereby said wheel is locked and released, substantially as and for the purpose described.

2. In an electrical switch, the combination of the base A, plate B, spring C C' C', supplemental spring D, provided with the groove D', and lever H, pivotally secured to a frame and provided with the ratchet-wheel I for engaging said spring D, substantially as and for the purpose described.

3. The combination of the base A, plate B, spring C C' C', supplemental spring D, provided with the groove D', bifurcated frame E, pin or shaft E', ratchet-wheel I, bifurcated lever H, bolt K, and spring L, substantially as and for the purpose set forth.

385,042. MARINER'S RECORDING-COMPASS. HENRY A. CHASE, Stoneham, Mass. Filed July 10, 1886. Renewed July 13, 1887. Serial No. 244,142. (No model.)

Claim.—1. The combination of a movable needle or pointer with a series of electric circuits having terminals in different positions within the range of movement of said needle or pointer, and a circuit-controlling device movable with the said needle or pointer and having an independent movement affecting the said circuits, the circuit at any time affected thus indicating the position of the needle or pointer at that moment, substantially as described.

2. A movable needle or pointer and series of electric circuits having terminals in different positions with relation to said needle or pointer, combined with a circuit-controlling device co-operating with the said circuit-terminals, having a movement corresponding with that of the needle or pointer, and a signaling-instrument connected in circuit with one or more of said terminals, whereby if the needle or pointer and circuit-controlling device move to a predetermined position the said signaling-instrument will be operated, but not otherwise, substantially as described.

3. A movable needle or pointer and series of electric circuits having terminals in different positions with relation to said needle or pointer, combined with a circuit-controlling device co-operating with the said circuit-terminals having a movement corresponding with that of the needle or pointer, and recording-instruments in one more of said circuits, whereby a record may be made of the position of the needle or pointer, substantially as described.

4. A movable needle or pointer and series of electric circuits having terminals in different positions with relation to said needle or pointer, combined with a circuit-controlling device co-operating with the said circuit-terminals, having a movement corresponding with that of the needle or pointer, and a series of recording-instruments and circuit-connecting device or switch-board by which said instruments are connected in circuit with any desired series of the said circuit-terminals co-operating with the controlling device governed by the needle or pointer, substantially as described.

5. A movable needle or pointer and series of electric circuits having terminals in different positions with relation to said needle or pointer, combined with a circuit-controlling device co-operating with the said circuit-terminals having a movement corresponding with that of the needle or pointer, and a series of recording-instruments and circuit-connecting device or switch-board, by which said instruments are connected in circuit with any desired series of the said circuit-terminals, and a recording-surface having a uniform or time movement, and connecting mechanism between the said recording-surface and the switch-board, whereby the position of the former relative to the recording-instruments is varied to correspond with the particular series of circuit-terminals at any time connected with the said recording-instruments, substantially as described.

6. A mariner's compass having a compass-box and pivotally-supported rings, constituting a gimbal-joint therefor, combined with a series of circuit-terminals connected with the inner ring or compass-box, concentric with the axis of oscillation of the said needle, and conductors from said terminals passing from the inner ring to the outer ring and from the latter to the surrounding frame-work at the joints of said rings, substantially as described.

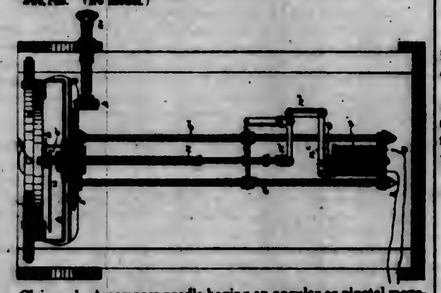
7. A mariner's compass having a compass-box and pivotally-supported rings, constituting a gimbal-joint therefor, combined with a series of circuit-terminals connected with the inner ring or compass-box concentric with the axis of oscillation of the said needle, and a series of contact-pieces connected with the said terminals and concentric with the axis of the supported member of the joint, and a series of contact-springs co-operating therewith on the supporting member of the joint, substantially as described.

8. In a mariner's compass, a compass-box provided with a vessel containing a liquid surrounding the needle-pivot, a needle, its pivot, and an annular float surrounding the said pivot and resting in the said liquid, combined with a circuit-controlling device having its position controlled by the said needle, and with a lifting device and actuating electro-magnet or solenoid therefor, to operate substantially as described.

9. The compass-needle having a free pivotal or angular movement, combined with a circuit-controlling device moved angularly with the needle, and means to move the said device in the direction of the axis of the angular movement of the needle, substantially as described.

10. The compass-needle having a free pivotal or angular movement, and a circuit-controlling device having its position controlled by the said needle, combined with a lifting device and actuating electro-magnet or solenoid therefor, having its axis coincident with that of the needle, substantially as and for the purpose described.

11. A movable needle or pointer and series of electric circuits having terminals in different positions with relation to said needle or pointer, combined with a circuit-controlling device co-operating with the said circuit-terminals, having a movement corresponding with that of the needle or pointer, and two independent signaling-instruments connected in circuit, each with one or more of the circuit-terminals at either side of the normal position of the needle, whereby deviation or apparent movement of the needle in each direction is indicated independently, substantially as described.



12. A movable needle or pointer and series of electric circuits having terminals in different positions with relation to said needle or pointer, combined with a circuit-controlling device co-operating with the said circuit-terminals, having a movement corresponding with that of the needle or pointer and a series of recording-instruments, and a circuit-connecting device or switch-board, by which said instruments are connected in circuit with any desired series of the said circuit-terminals, and a recording-surface having a uniform or time movement, and connecting mechanism between the said recording-surface and the switch-board, whereby the position of the former relative to the recording-instruments is varied to correspond with the particular series of circuit-terminals at any time connected with the said recording-instrument, and a clock or time-motor actuating the same, and a circuit-closer moved by said motor adapted to be set to operate at the end of any desired interval of time, and a signaling-instrument controlled thereby, substantially as described.

13. A movable needle or pointer and series of electric circuits having terminals in different positions with relation to said needle or pointer, combined with a circuit-controlling device co-operating with the said circuit-terminals, having a movement corresponding with that of the needle or pointer, and recording-instruments in one or more said circuits, whereby a record may be made of the position of the needle or pointer, and two independent signaling-instruments connected in circuit, each with one or more of the circuit-terminals at either side of those connected with the recording-instruments, whereby deviations of the circuits connected with the recording-instruments will be indicated, substantially as described.

14. A recording apparatus comprising a series of recording or marking instruments, and a recording-surface having a slow-timed movement with relation to the said instruments, and a shifting movement, by which different portions of its surface co-operate with the said instruments at different times, combined with shifting mechanism for changing the position of the said recording-surface, and a circuit-controlling device co-operating with the said indicating-instruments, and shifting mechanism, which prevents the indicating-instruments from being operated while the shifting mechanism is being moved, substantially as and for the purpose set forth.

15. A needle or pointer and an electric circuit and circuit-controlling device therefor, having a movement corresponding with the directive movement of the pointer, combined with an electro-magnet and clock or time-train controlling the circuit thereof, the said magnet being energized during definite intervals of time and moving the circuit-controlling device and locking the needle against movement by the directive influence acting on it, substantially as described.

385,043. ELECTRIC ALARM COMPASS. HENRY A. CHASE, Newton, Mass. Filed Feb. 16, 1886. Renewed July 13, 1887. Serial No. 244,143. (No model.)

Claim.—1. A compass-needle having an angular or pivotal movement, and electrical actuating mechanism for moving the said needle bodily in the direction of the axis of the pivot, and an electric circuit controlled by the said needle, substantially as described.

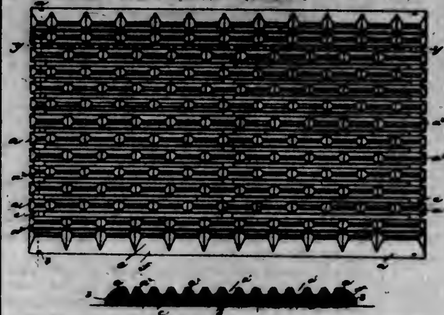
2. The combination of the pivoted needle of a mariner's compass with an electric circuit having terminals co-operating with the said needle, and a shield movable with relation to the compass-box or supporting frame-work of the said needle, the said shield, when in line with the needle, preventing the latter from affecting the said circuit, substantially as and for the purpose described.

3. A pivoted compass-needle and actuating mechanism for moving the needle-pivot, combined with an electric circuit under control of the said needle, and a mechanical motor or clock controlling the movement of the needle-pivot, substantially as described.

4. A compass-needle and supporting-ring therefor, constituting the terminals of an electric circuit, combined with an angularly-movable shield interposed between the said ring and needle, and mechanism for moving the said needle bodily toward the said ring, substantially as described.

5. A compass-needle having an angular and bodily movement and electric circuit controlled thereby, itself controlling the operation of a signal, combined with a clock or motor controlling the bodily movement of the said needle and also controlling the signal, substantially as described.

6. A compass-needle having a movable pivot, combined with a gimbal-joint support for the said needle, forming part of an electric circuit controlled thereby, a non-conducting shield, and mechanism for moving the said needle-pivot, whereby it is caused to close the circuit except when it coincides in position with the said shield, substantially as described.



7. The combination, with a pivoted magnetic needle, of circuit-terminals consisting of rings, the plane of which is parallel with the plane of movement of the said needle, which, when moved bodily into contact with the said rings, affords electrical connection between them, substantially as described.

8. The needle and circuit-terminals co-operating therewith, combined with the movable shield and actuating mechanism for the said shield normally disengaged therefrom, substantially as described.

9. A compass-needle having an angular or pivotal movement, and actuating mechanism for moving the said needle bodily in the direction of the axis of the pivot, and a mechanical motor or clock controlling the said bodily movement of the needle, as and for the purpose set forth.

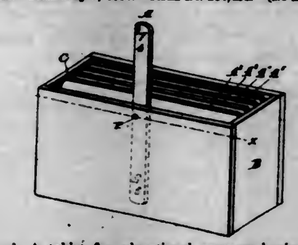
10. A compass-needle having an angular and bodily movement, and electric circuit controlled thereby, itself controlling the operation of a signal, combined with a clock or motor controlling the bodily movement of the said needle, substantially as described.

385,044. DOOR-MAT. Andrew M. Colby, Chicago, Ill. Filed Feb. 2, 1888. Serial No. 262,712. (No model.)

Claim.—1. A mat formed of strips provided with cross-cuts forming elevations and depressions, the strips being spaced and flexibly connected together, substantially as and for the purpose set forth.

2. As an improved article of manufacture, a mat consisting of wooden strips provided with cross-cuts forming elevations and depressions on the surface of the mat at suitable distances, the strips being flexibly connected together by wire and separated by collars on said wire, substantially as and for the purpose set forth.

385,045. SHOE-TONGUE FASTENING. CHARLES F. CROSWELL, Portland, Oreg. Filed Oct. 6, 1887. Serial No. 251,563. (No model.)



Claim.—1. In a boot, shoe, leggin, or similar article, the combination, with a flap having an eyelet, of a tongue having a hook adapted to project through the eyelet, and a lacing whereby the tongue is retained in place by the lacing engaging with the hook above the eyelet, substantially as described.

2. The combination, with a shoe having eyelets, as described, of a shoe-tongue having hooks adapted to project through the eyelets, and a shoe-lacing whereby the tongue is held in place and the shoe laced up, substantially as hereinbefore set forth.

3. In a shoe, the combination of the strip A, the tongue C, secured thereto, the strip B, hook *c*, eyelet *d*, and lacing-string, substantially as described.

4. The combination of a shoe having the strip A, strip B, tongue C, hooks *c c c' c'*, eyelets *f f d' d'*, and lacing-string, substantially as set forth.

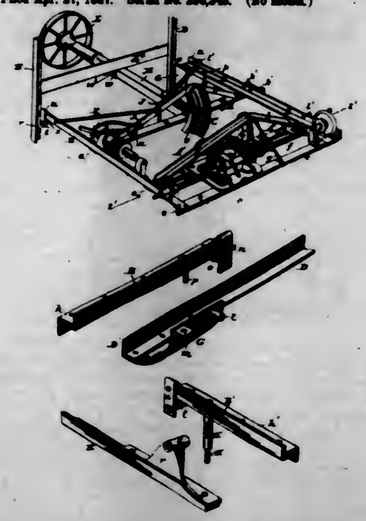
385,046. EDUCATIONAL APPARATUS. JAMES DURHAM, South Bend, Ind. Filed July 8, 1886. Serial No. 207,483. (No model.)

Claim.—1. A tablet for educational purposes having upon its faces various educational devices, such as figures or letters or color, large enough to be seen by the pupils, and smaller devices, words, letters, or figures on each side that will show what is exposed on the other side, substantially as described.

2. A tablet for educational purposes having on each side various combinations of large figures or devices and smaller guide figures or devices identical with the figures or devices exposed on the other side, as and for the purpose described.

3. A tablet for educational purposes having a large device on one side and an indicating or guide device on the other that will show what is on the other side.

4. A tablet for educational purposes having a large device on one side and an indicating or guide device or word on the other that will show what the large device is.



5. A tablet for educational purposes having one or more sets of devices or figures on each side and indicating devices, words, or figures to show what is on the opposite side.

6. A series of tablets revolving on a common axis and provided with means, such as interlocking blocks or lugs, whereby when one tablet is turned out of sight the face of the next succeeding one is brought to view.

7. A series of tablets mounted upon a common axis and provided with interlocking blocks or lugs, substantially as and for the purpose described.

8. The combination of a box, a series of vertically-revolving tablets, and a friction-surface for engaging the ends of said tablets as they pass, substantially as and for the purpose set forth.

385,047. HARVESTER. GEORGE RUSSELL, Whitewater, Wis. Filed Apr. 27, 1887. Serial No. 236,343. (No model.)

Claim.—1. In a harvester, a metallic main-wheel frame consisting of the front and rear cross-bars, B B', and the two trusses A A', each of the latter consisting of the bottom member, *a*, riveted at its ends to the cross-bars, and the angular top member, *b*, riveted at its ends to the bottom member.

2. In a metallic wheel-frame for a harvester, the cross-bars B B', of L shape in cross-section, in combination with the two side bars, *a*, of T shape in cross-section, riveted at their ends to the under side of the cross-bars, the heel bars *b*, of L shape in cross-section, riveted at their ends to the upper faces of the side bars, and the rack-plates connecting the bars *a b*, as shown.

3. In a wheel-frame for a harvester, the combination of the trusses A A', substantially as described, the cross-bars B B' attached thereto and extended on the stubble side, as shown, and the bar *c*, attached to their extended ends, substantially as described, whereby a firm support for the shaft-bearings is secured.

4. In a metallic wheel-frame for a harvester, the combination of the side trusses, A A', the front and rear cross-bars, B B', of angular shape in cross-section, secured rigidly to the ends of and extended grainward beyond the trusses, the re-enforcing bars *h h'*, of L shape in cross-section, riveted to the overhanging ends of the bars B B', their horizontal flanges being applied on top of the horizontal flanges of the bars B B', and their vertical flanges extended downward, as shown.

5. In a wheel-frame for a harvester, the combination of the side trusses, A A', the cross-bars B B', attached thereto and extended stubbleward beyond the truss A', the bar *c*, secured to the extended ends of the cross-bars parallel with the trusses, and the brace *g*, extended from the middle portion of bar *c* to the top of the truss A'.

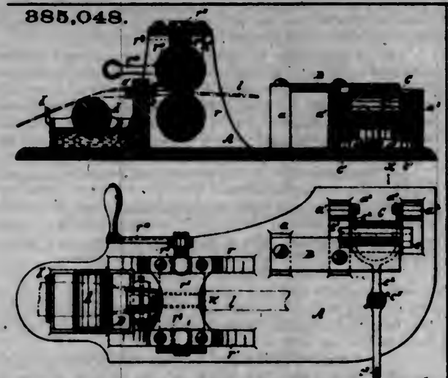
6. In a harvester, the main-wheel frame having the bar B, of L shape in cross-section, projected at the grain side and provided with the re-enforcing bar *h* in the manner shown, in combination with the plate *n*, secured to bar B, the finger-bar D, the shoe-plate G, secured to the finger-bar, carved forward and upward therefrom and provided with an ear, *m*, the horizontal pivot-bolt *o*, extending through the shoe and the depending flange of plate *h*, and the removable bolt *p*, whereby the finger-bar may be secured rigidly in operative relation to the wheel-frame or permitted to assume a vertical position at will.

7. The main-wheel frame having the bar B', of L shape in cross-section, extended on the grain side, the re-enforcing bar *h'*, of L shape in cross-section, secured to the bar B', in the manner shown, and the depending plate *u*, also secured to the bar B', in combination with the rear platform-sill, the plate *r*, secured thereto, the horizontal pivot passing through said plate and through the plates *h'* and *u*, and the removable bolt H and sleeve I.

8. The improved hinge-joint for connecting a harvester main-wheel frame and platform-frame, consisting of a bar of L shape in cross-section extended grainward from the wheel-frame, a re-enforcing bar of an inverted-L shape in cross-section, as *h*, riveted to the horizontal portion of the first-named bar, with one flange extended downward below the same, a plate, as *n*, secured to and extending below the first-named bar, a plate or arm rising from the platform-frame and and inserted between the plates *h* and *n*, and a horizontal bolt passing through said plates and the intermediate arm.

9. In a harvester, the combination of the main-wheel frame, the platform-frame hinged to its grain side to turn vertically, the removable axle M, bearing beneath the inner end of the upturned platform-frame and upon the grain side of the wheel-frame, and the wheel L, applied to the grain end of said axle.

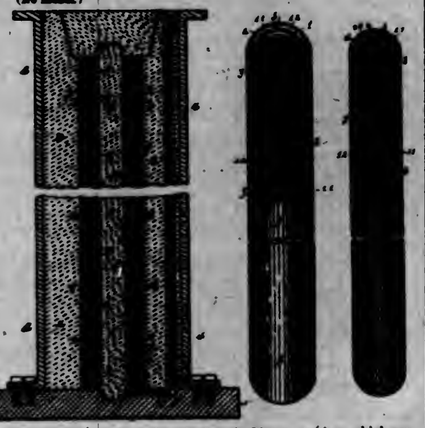
10. The main-wheel frame having the rack-plate C at its grain side, in combination with the main wheel in said frame, the vertically-folding platform hinged to the grain side of the wheel-frame, the grain-wheel, and the detachable axle M for said wheel, adapted to extend beneath the end of the upturned platform and provided at its stubble end with the plate *v* to engage the rack, and the plate *w* at its other end connecting the axle with the platform-frame, as shown, whereby the grain-wheel is held temporarily in position to support the grain side of the machine when the platform is folded to its upright position.



11. In combination with the main-wheel frame and the elevator-frame, substantially as described, the tongue hinged to the wheel-frame, the two vertical bars *x x*, angular in cross-section, secured to the wheel-frame and the elevator-frame, as described and shown, the tilting lever sustained by a pivot passing through the bars *x x*, and the connection from said lever to the tongue.

12. In a metallic main-wheel frame for a harvester, the trusses or side frames and the front and rear cross-bars, B B', projected grainward beyond the inner truss to sustain the platform-frame, in combination with the diagonal braces extending from the overhanging ends of the cross-bars stubbleward to the inner truss or side frame.

385,048. GIMP-MACHINE. GEORGE FARNHAM, Philadelphia, Pa. Filed Mar. 5, 1888. Serial No. 266,267. (No model.)



Claim.—A gimp-machine consisting of the leather-splitting device

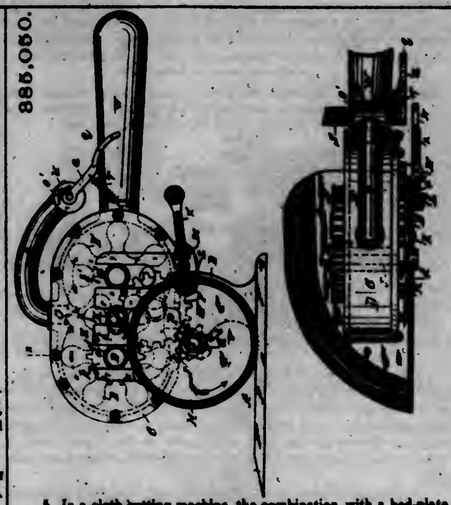
385,048.

composed of the knife B, roller C, journal-frame *c'*, lever *c²*, adjusting-screw *c³*, and spring *c⁴*, and of a glue-receptacle, D, guide *d'*, roller *d*, former *e*, pressure-roller R, and ornamenting-roller R', all arranged substantially as and for the purposes set forth.

385,049. MANUFACTURE OF SHAFTS AND ORDNANCE. JOHN E. PLASKER, New York, N. Y. Filed May 25, 1887. Serial No. 239,378. (No model.)

Claim.—The method of producing shafting or tubing, which consists in casting steel around and between layers of wrought-metal tubing, then subjecting the ingot or tube thus formed to a rolling operation, substantially as described.

385,050. CLOTH-CUTTING MACHINE. GABRIEL J. W. GALSTER, New York, N. Y. Filed Oct. 27, 1887. Serial No. 253,512. (No model.)



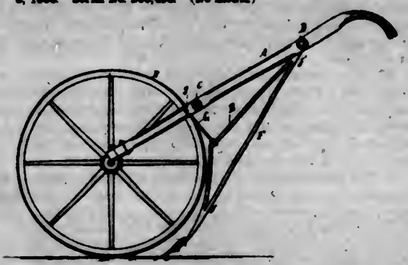
Claim.—1. In a cloth-cutting machine, the combination, with a bed-plate and a vertical standard rigidly connected together, of a rotary air or gas motor secured to the latter, a flexible supply-pipe, and a rotary knife driven by said motor and supported by said standard, as and for the purpose described.

2. In a cloth-cutting machine, the combination, with a bed-plate and a vertical standard rigidly connected together, of a rotary air or gas motor secured to the latter and provided with a handle, a flexible supply-pipe, a rotary knife driven by said motor and supported on said standard, and a supply-cock having a hand-hold in convenient proximity to said handle, as and for the purpose described.

3. In a cloth-cutting machine, the combination, with a bed-plate and a vertical standard, of a rotary air or gas motor secured to the latter, a flexible supply-pipe, a rotary knife driven by said motor, and a sharpening device attached to said motor, said sharpening device having a hand-hold in convenient proximity to the handle of the machine, as and for the purpose described.

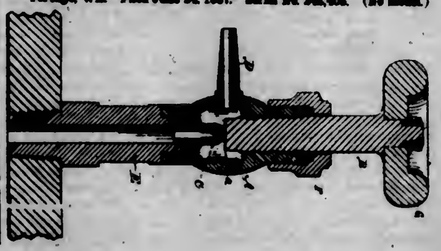
4. In a cloth-cutting machine, the combination of a bed-plate, a vertical standard, an air-cylinder adjustably secured to said standard and provided with piston-wheels, a rotary cutter secured to a shaft journaled in said cylinder, and intermediate gearing supported by said cylinder, as and for the purpose described.

385,050.



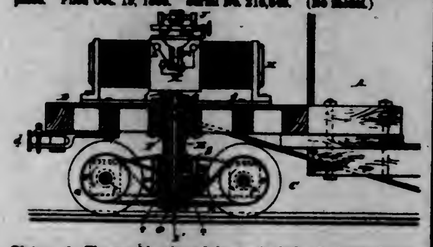
5. In a cloth-cutting machine, the combination, with a bed-plate and a vertical standard, of a rotary motor adjustably secured to the latter, a flexible supply-pipe, and a rotary knife driven by said motor, as and for the purpose described.

6. In a cloth-cutting machine, the combination, with a bed-plate and a vertical standard, of a rotary motor secured to the latter, a flexible supply-pipe, and a rotary knife driven by said motor and adjustably secured to said standard, as and for the purpose described.



7. In a cloth-cutting machine, the combination, with a bed-plate and a vertical standard, of a rotary motor adjustably secured to the standard, and a rotary knife driven by said motor and adjustably secured to said standard, as and for the purpose described.

385,051. GARDEN-PLOW. WILLIAM H. HEARD, Jacksonville, Ark., assignor of one-half to Martin Josiah McHenry, same place. Filed Apr. 3, 1886. Serial No. 200,498. (No model.)



Claim.—The combination of the handles A, wheel B, elbow gram-rod G, eyebolt *e*, securing said gram-rod adjustably to a foot-bar, elbowed foot-bar E, bearing on its lower end a plow-point and having near its elbow the perforation *d'*, elongated at its front end and having its upper end pivotally secured to the cross-rod D, and brace-bar F, secured to foot-bar E, all substantially as shown and described, and for the purposes set forth.

385,052. GAGE-COCK. JOHN R. HODGE and WILLIAM M. DAVIS, Portage, Wis. Filed June 24, 1887. Serial No. 242,403. (No model.)

Claim.—In a gage-cock constructed as herein described, the combination of the removable steel cone-shaped-edged valve-seat C with the screw-stem B, of softer metal, as and for the purpose set forth.

385,053. ELECTRIC RAILWAY. RUDOLPH M. HUNTER, Philadelphia, Pa., assignor to the Electric Car Company of America, same place. Filed Oct. 19, 1886. Serial No. 216,662. (No model.)

Claim.—1. The combination of the car-body having seats for passengers, with an operating-platform at its forward end and exterior to the car-body proper, a centrally-pivoted car-truck arranged under said platform and close to the forward end of the car, and an electric motor carried by the car to impart motion to the truck, having a rotating shaft and a connection between the motor-shaft and truck-axle.

2. The combination of the car-body having a platform at one end projecting beyond the car-body, a four-wheeled truck pivoted beneath the platform at a point between its four wheels, an electric motor to propel said truck, an electric circuit and current-controlling mechanism and a power-transmitting connection between the said motor and truck, whereby the truck may move freely without affecting the motor-connection with it.

3. The combination of the car-body having a platform at one end projecting beyond the car-body, a four-wheeled truck pivoted beneath the platform at a point between its four wheels, an electric motor to propel said truck, an electric circuit and current controlling mechanism, and a power-transmitting connection between the said motor and truck extending through the pivot-connection, whereby the truck may move freely without affecting the motor-connection with it.

4. The combination of the car-body with a motor-platform at its forward end, a truck pivoted to said car-body under the platform, an electric motor to propel said car supported upon said platform and having its shaft arranged vertically and extended down through the pivot or king-bolt of the truck, and a connection between said shaft and truck-axle.

5. The combination of the car-body with a motor-platform at its forward end, a truck pivoted to said car-body under the platform, an electric motor to propel said car supported upon said platform, having its shaft arranged vertically and extended down through the pivot or king-bolt of the truck, and a connection between said shaft and truck-axles, consisting of a sprocket-chain and sprocket-wheels.

6. The combination of the car-body with a motor-platform at its forward end, a truck pivoted to said car-body under the platform, an electric motor to propel said car supported upon said platform, having its shaft arranged vertically and extended down through the pivot or king-bolt of the truck, and a connection between said shaft and truck-axles, consisting of a sprocket-chain and sprocket-wheels and guide-wheel, the chain passing over the sprocket-wheels on the axles and around the sprocket-wheel on the shaft and under the guide-wheel.

7. The combination of the car-body with a motor-platform at its forward end, a truck pivoted to said car-body under the platform, an electric motor to propel said car supported upon said platform, having its shaft arranged vertically and extended down through the pivot or king-bolt of the truck, a flanged sprocket-wheel on the end of said shaft, a sprocket-wheel on the axle of the truck, and a chain passing about said sprocket-wheels.

8. The combination of a car-body supported on springs, a four-wheeled truck pivoted to said car-body between its four wheels, an electric motor carried by the car-body and movable vertically therewith, a source of electric supply, an electric circuit for the motor, a switch to control the motor, and a compensating connection between the said motor and truck-axle, extending through the pivot or king-bolt of the truck and between the four wheels, whereby the connection between the motor and axle is the same irrespective of the vertical movements of said car-body upon the truck, substantially as and for the purpose specified.

9. The combination of a car-body supported on springs, a four-wheeled truck pivoted to said car-body between the four wheels, an electric motor carried by the car-body and movable vertically therewith, and a compensating connection between the said motor and both truck-axles, whereby the connection between the motor and axle is the same irrespective of the vertical movements of said car-body upon the truck, substantially as and for the purpose specified.

10. The combination of a car-body having a forward platform supported on springs, a truck pivoted to said car-body under said platform, an electric motor carried by the car-body platform and movable vertically therewith, and a compensating connection between the said motor and truck-axle, whereby the connection between the motor and axle is the same irrespective of the vertical movements of said car-body upon the truck, substantially as and for the purpose specified.

11. The combination of the car-body having seats for passengers, having a motor-operating platform at its forward end and exterior to the car-body proper, a centrally-pivoted truck under said platform, an electric motor exterior to the car-body arranged immediately above said truck, in operative position from said platform, and a power-transmitting connection between the motor and truck-axle.

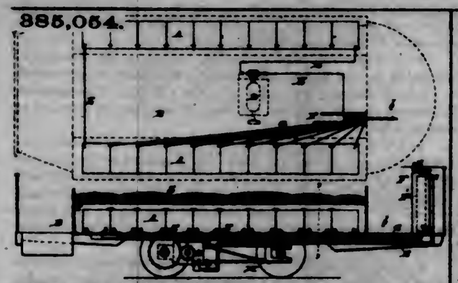
12. The combination of the car-body supported on springs, a truck pivoted to said car-body by a hollow king-bolt, an electric motor on said car-body having a vertical shaft extending through the hollow king-bolt, and a compensating power-transmitting connection from the lower part of said shaft to the truck-axle.

13. The combination of the car-body supported on springs, a truck pivoted to said car-body by a hollow king-bolt, an electric motor on said car-body having a vertical shaft extending through the hollow king-bolt, and a compensating power-transmitting connection from the lower part of said shaft to the truck-axle, consisting of, a sprocket-wheel rotating with said shaft, but independent of its vertical movements, a sprocket-wheel on the truck-axle, and a sprocket-chain passing about both sprocket-wheels.

14. The combination of the car-body supported on springs, a truck pivoted to said car-body by a hollow king-bolt, an electric motor on said car-body having a vertical shaft extending through the hollow king-bolt, and a compensating power-transmitting connection from the lower part of said shaft to the truck-axle, consisting of a sprocket-wheel rotating with said shaft, but independent of its vertical movements, a sprocket-wheel on the truck-axle, a sprocket-chain passing about both sprocket-wheels, and a pressure-wheel to keep the chain on the motor-shaft sprocket-wheel.

15. The combination of the passenger-car body arranged low down and close to the rails with the high forward platform, an electrically-propelled truck of greater height than the distance from the car-body to the rails arranged under said raised platform and pivoted thereto, an electric circuit carried by the car to supply electricity to the electrically-propelled truck, and means to control the flow of current in said circuit.

16. The combination of the passenger-car body arranged low down and close to the rails with the high forward platform, an electrically-propelled truck of greater height than the distance from the car-body to the rails arranged under said raised platform and pivoted thereto, a line-conductor arranged parallel with the railway, an electric circuit carried by the car, receiving electricity from said line-conductor, and adapted to supply electricity to the electrically-propelled truck, and means to control the flow of current in said circuit.



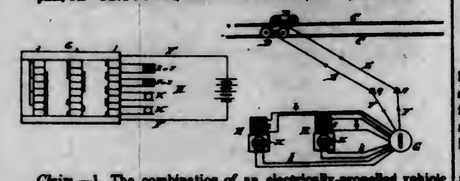
17. The combination of the car-body having provision for passengers and supported on springs, an electrically-propelled truck pivoted to said car-body, which it supports, an electric motor to propel the said truck, a direct mechanical power-transmitting connection between the motor and axle of the truck and arranged within the area of the truck, whereby the truck may freely move and the car-body rise and fall without affecting the motor-connection with the axle, a motor-circuit carried by the car and extending to the motor, and means to control the flow of current through said motor-circuit arranged upon the car-body.

18. The combination of a car-body having accommodations for passengers and a motor-operating platform at its forward end, a centrally-pivoted electrically-propelled truck arranged under said platform, an electric motor for propelling said truck arranged exterior to the car-body and above the truck-base and in operative position from said platform, a power-transmitting connection between the motor and axle of the truck, a source of electric supply, a motor-circuit carried by the car and connecting with the terminals of the motor, and means for regulating the motor within reach of the operator on said platform.

19. The combination of a car-body having a motor-operating platform at its forward end, an electrically-propelled truck pivoted under said platform, a source of electric supply, a motor-circuit carried by the car and supplying current to the motor, and regulating means on or at the platform for controlling the flow of current to the motor of the electrically-propelled truck.

385,054. ELECTRIC RAILWAY. RUDOLPH M. HUNTER, Philadelphia, Pa. Filed Jan. 23, 1888. Serial No. 261,622. (No model.)

Claim.—1. The combination of a car, an electric motor carried thereby to propel it, a number of removable battery-cells having exposed terminals on the car and adapted to be coupled in series connection, a motor-circuit including the motor and batteries and fixed to the car having exposed terminals adapted to contact with the battery-terminals when the cells are placed in position, and thus automatically couple up the battery with the motor-circuit, and a regulator to vary the number of battery-cells in series connection with the motor.

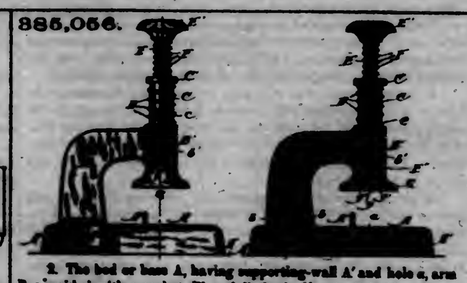


2. The combination of a car or vehicle, an electric motor carried thereby to propel it, a mechanical power-transmitting connection between the motor and axle, a number of removable battery-cells having exposed terminals on the car, a flexible motor-circuit including the motor and battery-cells looped so as to extend to the forward part of the car, and having exposed terminals adapted to contact with the battery-terminals when the cells are placed in position, and thus automatically couple up the battery with the motor-circuit, and a regulator arranged at the front of the car in the motor-circuit and in reach of the operator to vary the current flowing from the battery-cells through the motor.

3. The combination of a car, an electric motor to propel it, a series of removable battery-cells having exposed terminals on the car, circuits including the motor and battery fixed to the car having exposed terminals adapted to contact with the battery-terminals when the cells are placed in position, and thus automatically couple up the battery with the motor, and a regulating device having a single operating-handle within reach of the operator to modify the electrical connection between the battery-cells and motor by coupling them up in series or multiple connection or combinations of these.

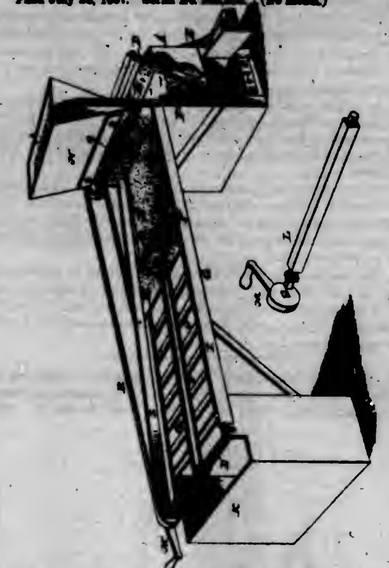
4. The combination of a car or vehicle, an electric motor carried thereby to propel it, a number of removable battery-cells having exposed terminals on the car, a motor-circuit including the battery-cells and motor fixed to the car or vehicle, and having exposed terminals adapted to contact with the battery-terminals when the cells are placed in position, and thus automatically couple up the battery with the motor-circuit, and a regulator in the motor-circuit to vary the current flowing from the battery-cells through the motor.

385,055. ELECTRIC RAILWAY. RUDOLPH M. HUNTER, Philadelphia, Pa. Filed Feb. 24, 1888. Serial No. 265,174. (No model.)



Claim.—1. The combination of an electrically-propelled vehicle having two electric motors, a source of electric supply, and switches for coupling up the motors in series or multiple with the source of supply to vary the speed or power of the motors.

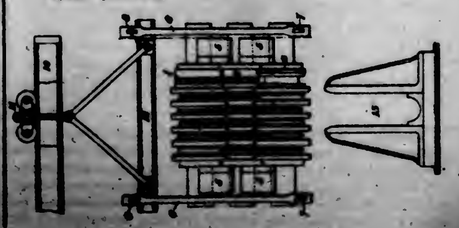
2. The combination of supply-conductors arranged parallel to a railway and adapted to supply positive and negative current, a moving collecting device or contact for each conductor, an electrically-propelled car or train of cars, two or more motors on said car or train to propel it, circuits including all of the coils of the motors and connecting with the collecting devices by conductors, and a switch in said circuits to vary the internal resistance of the motors as a unity by coupling their coils, so as to vary the length of wire of the coils in circuit, and consequently the resistance.



385,056. PAPER-PUNCH. JOHN C. JOHNSON, Chicago, Ill. Filed Jan. 7, 1888. Serial No. 259,101. (No model.)

Claim.—1. The tube C, having screwed thereto the head G, in combination with die rod B, carrying a perforating knife or blade, and springs D and F, of unequal strength, for automatically withdrawing the knife or blade after a perforation has been made, substantially as specified.

2. The bed or base A, having supporting-wall A' and hole a, arm B, provided with a socket, B', and limit-pin b', tube C, having slot c, and hobbing-head G, in combination with the rod B, having groove e and blade or knife E', and coiled springs D and F, of unequal strength, substantially as and for the purpose specified.



385,057. ROOFING FABRIC. ALEXANDER JOHNS, Boston, Mass. Filed July 23, 1887. Serial No. 244,606. (No model.)

Claim.—1. The herein-described roof-covering, consisting of a layer of felt, a layer of cotton fabric saturated with a mixture of rosin, shellac, litharge, rosin-oil, linseed-oil, and asphaltum, coated on both faces with sand, and a top dressing of mineral paint, linseed-oil, litharge, shellac, and zinc, or the described equivalents of these materials, in substantially the proportions above set forth.

2. The herein-described roofing material, consisting of woven fabric saturated with a mixture of rosin, shellac, litharge, rosin-oil, linseed-oil, and asphaltum, or their described equivalents, in substantially the proportions stated, and coated on both faces with sand or its equivalent.

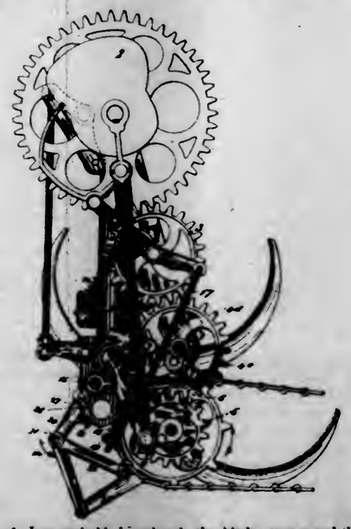
385,058. APPARATUS FOR REMOVING AND SETTING ROLLS. WILLIAM R. JOHNS, Braddock, Pa. Filed Apr. 10, 1886. Serial No. 270,282. (No model.)

Claim.—1. An improvement in apparatus for removing or setting rolls from of in their housings, which consists in lifting-stirrups adapted to engage the lower roll and to suspend the same together with the roll or rolls above, substantially as and for the purposes described.

2. An improvement in apparatus for removing or setting rolls from or in their housings, which consists in lifting-stirrups adapted to engage the necks of the lower roll and to suspend the same together with the roll or rolls above, said stirrups having side bars which constitute a frame inclosing the necks of the rolls, substantially as and for the purposes described.

3. An improvement in apparatus for removing or setting rolls from or in their housings, which consists in lifting-stirrups adapted to engage the lower roll and to suspend the same together with the roll or rolls above, in combination with a stand or temporary housing for supporting the rolls temporarily, and a lifting device, such as a crane, whereby the rolls are transferred from the housings to the stand or from the stand to the housings, substantially as and for the purposes described.

4. The combination, with roll-housings, of a stand or temporary housing adapted to support the rolls and their bearings temporarily, and a lifting device, such as a crane, for removing the rolls from one to the other, substantially as and for the purposes described.



5. The combination, with roll-housings, of a stand or temporary housing for supporting the rolls temporarily, and a rotary crane for removing the rolls from one to the other, said housings and the stand being equidistant from the axis of the crane, substantially as and for the purposes described.

6. An improvement in apparatus for removing or setting rolls, which consists in stirrups composed of open frames having side bars and cross-pieces at the bottom, said stirrups being adapted to be suspended from a crane or lifting device, substantially as and for the purposes described.

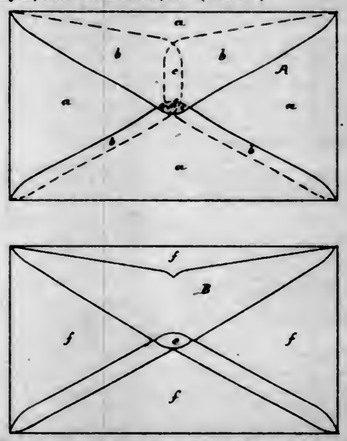
7. An improvement in apparatus for removing or setting rolls, which consists in stirrups composed of open frames having side bars and removable cross-pieces at the bottom, said stirrups being adapted to be suspended from a crane or lifting device, substantially as and for the purposes described.

8. The combination, with roll-housings, of a stand or rest for supporting the rolls temporarily, said stand consisting of separated uprights 13, adapted to receive the necks of the rolls and their interposed bearings, and a lifting device, such as a crane, substantially as and for the purposes described.

385,059. GRAIN-BINDER. SAMUEL V. KENNEDY and CHARLES A. ANDERSON, Minneapolis, Minn., assignors to the Minneapolis Harvester Works, same place. Filed Sept. 5, 1887. Serial No. 248,062. (No model.)

Claim.—1. In a grain-binder wherein the binder proper and the packers work and rest alternately, clutching mechanism to drive the binder, and clutching mechanism to drive the packers, in combination with a single stop-dog in the form of an arm pivoted at one end and swinging in the plane in which the said clutching mechanisms are arranged for acting alternately with the clutching mechanisms of the binder and packers to stop and hold one at rest while the other is in operation, substantially as set forth.

2. In a grain-binder, the trip-shaft 15, having the stop-dog 14 secured to one end thereof, the crank-arm 20 at the other end thereof, the yoke 21 sleeved thereon near the crank-arm 20, and the set-screw 23 inserted through a part of the yoke 21, whereby the stop-dog 14 may be adjusted, as described.



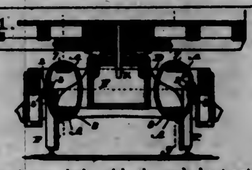
3. In a grain-binder, the trip-shaft 15, having the stop-dog 14 secured to one end thereof, the crank-arm 20 secured to the other end thereof, and the yoke 21 sleeved thereon near the crank-arm 20 and acting upon the crank-arm 20 in one direction to trip the binder, whereby the crank-arm 20, and hence the stop-dog 14, may have a movement independent of the movement of the yoke 21, as and for the purpose described.

4. In a grain-binder, the main frame 1, having formed upon it a flange, *a*, provided with seats or bearings for supporting the inner end or ends of an intermediate gear-wheel stud or studs, and an additional flange, *c*, provided with seats or bearings for supporting the outer end or ends of the intermediate gear-wheel stud or studs, and a seat or bearing for supporting the driving and packer shafts outside of the driving-gears thereof.

5. In a grain-binder wherein the stop-dog is actuated by a cam on the binder-gear, a lever, 16, actuated in one direction by the said cam, in combination with a spring, *n*, for actuating the said lever in the opposite direction, a stop-dog, 14, for controlling the movement of the binder, and a rod, 17, connecting the lever 16 with the said stop-dog, and provided with a shoulder, *l*, for transmitting to the said stop-dog the motion derived from the spring *n*, as and for the purpose described.

6. In a grain-binder wherein the stop-dog is actuated by a cam on the binder-gear, the combination, as herein set forth, of the lever 16, the spring *n*, the stop-dog 14 for controlling the movement of the binder, the rod 17, connecting the lever 16 with the stop-dog 14, and provided with the shoulder *l*, the adjusting-nut 19 upon the lower threaded portion of the rod 17, and the expanding-spring 18, bearing at its lower end against the nut 19 and at its upper end against the under side of the stop-dog 14.

385,060. BLANK ATTACHMENT FOR TYMPAN-SHEETS FOR PRINTING ENVELOPES. GUSTAVUS F. KIMBALL, Topeka, Kans. Filed July 22, 1887. Serial No. 244,997. (No model.)

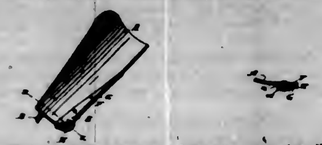


Claim.—1. As a new article of manufacture, the blank B, for attachment to the tympan-sheet of a printing-press, provided with flaps which increase its thickness at those places which register with the thinner portions of the envelopes when the envelopes are placed upon it with their edges guided by and coinciding with its edges, substantially as set forth.

2. As a new article of manufacture, the blank B, for attachment to the tympan-sheet of a printing-press, provided with a hole, *c*, and with the flaps *f*, which make it two-ply thick, and which register with the correspondingly-thinner portions of the envelopes when the envelopes are placed upon the blank with their edges guided by and coinciding with its edges, substantially as set forth.

385,061. RAILWAY-CAR SPRING. BERNARD J. LA MOTHE, New York, N. Y. Filed Aug. 31, 1887. Serial No. 248,308. (No model.)

Claim.—1. The combination, with the car-truck and the upper and lower bearings, 7 and 8, of a suspension-spring formed of a band

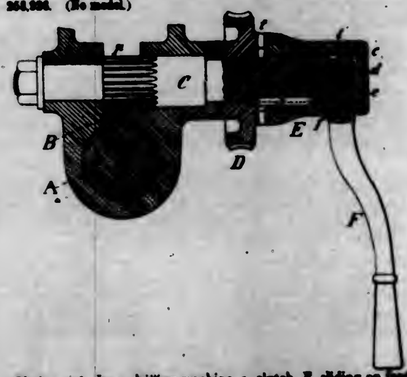


385,061.

of steel rolled up into a circle, with the ends bent outwardly, and a clip-band, 2, surrounding the convolutions, and against the opposite edges of which the outwardly-turned ends of the spring rest, substantially as set forth.

2. The combination, with the transom-beams D E, in a railway car and truck, and the bearings 7 and 8, of a suspension-spring formed of a steel band coiled into a circular form and the ends turned outwardly, and a band, 2, passed around the spring between the outwardly-turned ends for holding the same, substantially as specified.

385,062. TRACK-SCRAPER. HARRIS H. LITTELL, Louisville, Ky. Filed Oct. 31, 1887. Serial No. 253,502. (No model.)



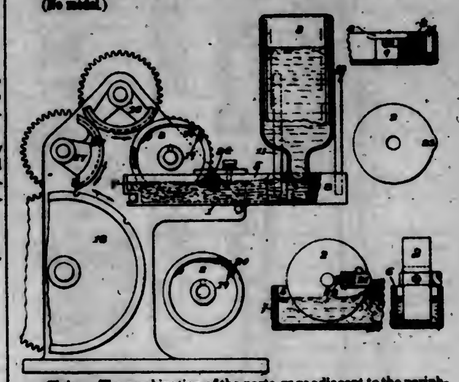
Claim.—1. In a scraper of the character described, the main blade, in combination with the removable shoe, which shoe is made of alternate layers of hard and soft material, substantially as and for the purposes specified.

2. In a scraper of the character described, the main scraper-blade, depressed as described, in combination with a removable shoe made of alternate layers of hard and soft material, the hard material on the outside or front of the shoe, substantially as and for the purposes specified.

3. As a new article of manufacture, a removable shoe for scraper-blades, constructed, substantially as described, with alternate layers of hard and soft material, as and for the purposes set forth.

4. As a new article of manufacture, a detachable shoe for scrapers made of alternate layers of hard and soft material and provided with a curved or dished agitator, substantially as and for the purposes specified.

385,068. FEEDING DEVICE FOR DRILLING. WILLIAM LOGAN and HENRY DRIVER, Cincinnati, Ohio. Filed Dec. 24, 1887. Serial No. 258,998. (No model.)



Claim.—1. In a drilling-machine, a clutch, E, sliding on feed-shaft C, in combination with a lever, F, passing through one side of said clutch, pivoted into the slotted feed-shaft C, and so constructed as by moving said lever in the axial plane of shaft C to engage or disengage half-clutch E with clutch *t*, formed on worm-wheel D, substantially as described.

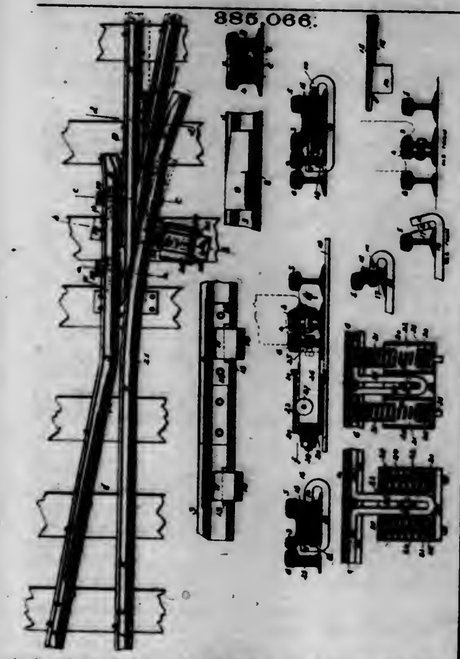
2. The combination, in a drilling-machine, of a slotted feed-shaft, C, the plug *a*, and a spring, *b*, beneath the plug *a*, in connection with lever F, pivoted to shaft C, and adapted to force clutch E into the corresponding clutch, *t*, formed on outside of worm-wheel D, all substantially as set forth.

3. The combination of a clutch, E, with flat spring *i* fastened to it, in connection with lever F, having the projection *s* to enter recess *r* in said spring, substantially as shown, and for the purpose specified.

385,064. PASTING APPARATUS. WILLIAM A. LOGUEE and WILLIAM H. HOUSE, Hartford, Conn. Filed July 30, 1887. Serial No. 245,603. (No model.)

Claim.—The combination of the paste-gage adjacent to the periphery of the paste-roll and the paste-roll provided with a peripheral protuberance coming nearly or quite in contact with the paste-gage, the whole being so constructed and arranged that the paste-gage regulates the depth of the paste on the periphery of the paste-roll, and the peripheral protuberance on the paste-roll keeps paste from accumulating on the edge of the paste-gage, all substantially as described.

385,065. WEATHER-STRIP. THOMAS K. MILROY, Parsons, Kans. Filed Jan. 14, 1888. Serial No. 260,710. (No model.)



Claim.—The improved weather-strip herein described and shown, consisting of a metallic body having its inner and outer sides bevelled, provided at its inner corners with the laterally-projecting beveled lugs *b*, adapted to bear against the inner face of the door-frame, having the longitudinal groove *c* in its top and the transverse depressions *d* at the ends communicating with said groove, and having the shoulders A at the outer sides of said depressions adapted to fit in recesses in the opposing sides of the door-jambs, substantially as specified.

385,066. RAILWAY-FROG. GEORGE W. PARSONS, Harrisburg, Pa. Filed Oct. 8, 1888. Serial No. 315,731. (No model.)

Claim.—1. In a railway-frog, the point consisting of the rails 3 and 4, in combination with the block 8, secured firmly between them, said block having its top surface inclined gradually upward from the

885,066.

heel to the level of the top of the point-rails, whereby the extra flange on grooved or guttered wheels is prevented from falling between and displacing the point-rails.

2. The wheel-bearing plate for a railway-frog, consisting of the hard-metal plate having the metal body cast thereon.

3. In a spring-frog, the combination of a stationary point and a spring-rail lying in contact with its side from the forward end rearward to a place at which the point is of a width equal to or greater than the width of the tread of the wheels.

4. In a railway-frog, the combination of a fixed point and a spring-rail lying in contact with the side thereof from the forward end of the point rearward in position to receive and sustain the outer edge of the tread of the wheels as soon as they begin to project laterally beyond the point in passing thereover, whereby any extra flange on the outside of the wheel is prevented from descending between the point and the spring-rail.

5. A railway-frog having its spring-rail extended along and in contact with the point and toward the heel of the latter until the point has a width equal to or exceeding that of the tread of the wheels, whereby the derailment of the train by extra flanges on the outside of the wheels is prevented.

6. In a railway-frog, the combination of the spring-rail, the lateral arm attached rigidly thereto, and the stationary guide or housing for said arm.

7. In a railway-frog, the combination of the spring-rail, the lateral arm fixed thereto, the rigid guide or housing, and the anti-friction roller attached to the arm.

8. In a frog, the spring-rail having its flange removed and the strengthening-bar 25 fixed thereto, substantially as described, said bar having the lateral guide-arm formed integral therewith.

9. In a railway-frog, the combination of the point, the spring-rail having its flange cut away that it may close against the point, and a strengthening-bar fixed to the side of the rail and extended beyond the reduced portion, as described, whereby the springing or bending of the rail is prevented.

10. In a railway-frog, the combination of the spring-rail, the lateral arm fixed thereto, a stationary guide or housing for said arm, and springs applied, substantially as described, to urge the rail toward the point.

11. In a railway-frog, the combination of the spring-rail, its lateral arm, the guide or housing for said arm, the yoke-bar acting on the arm, and the springs applied to the yoke-bar.

12. In a railway-frog, the combination of the point, the stationary wing-rail, the movable spring-rail, the underlying stationary plate 19, fixed to the stationary wing-rail at one end and provided with a guide or housing at the opposite end, the lateral arm fixed to the movable rail and acting in said guide, and the springs tending to urge the movable rail inward.

13. In combination with the spring-rail provided with the lateral arm, the guide or housing having a shoulder, 20, to resist and support the movable rail.

14. In a railway-frog, and in combination with the point and wing-rail, the clamping-bar having its end returned in a horizontal position, and the wedge-shaped bearing-plate, against which said end is seated, substantially as described, whereby the derailed wheels are prevented from opening the clamp.

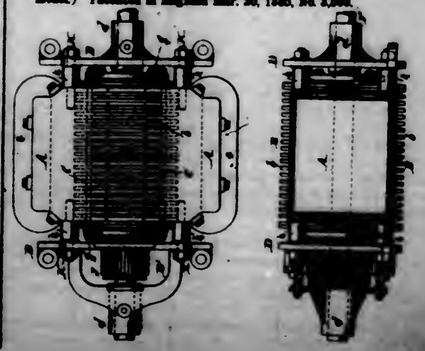
15. In a railway-frog, the combination of the point, the stationary wing-rail, and the clamp 10, having its outer end returned horizontally toward the wing-rail and its inner end extended vertically through the flange of the point-rail and secured by a key, substantially as described.

16. The improved clamp for a railway-frog, consisting of the bar 10, having one end curved upward and inward horizontally and the opposite end turned to a vertical position and provided with a recess for a fastening-key.

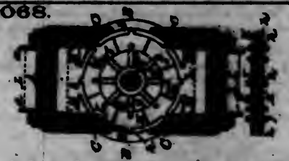
17. The combination of the point, the stationary wing-rail, the bearing-plate 15, the clamping-bar 10, having the vertical and the horizontal ends, the fastening-key 12, the bearing-wedge 15, and the fastening-plate 16.

18. In a railway-frog, the combination of the rail, the clamp having its end presented horizontally toward the outer side of the rail, the intermediate wedge, and the fastening plate or strip 16, applied as described and shown.

885,067. ELECTRIC CUT-OUT. CHARLES S. PERKINS, Hartford, Conn. Filed Aug. 27, 1887. Serial No. 248,013. (No model.)



Claim.—1. The combination of a plug carrying a safety-strip and a block for electrical cut-out provided with a chamber having a lateral enlargement, whereby the plug may be readily inserted to close and removed to break the circuit, substantially as described.



2. The combination, with the main wire, of bolt C, springs D, plug G, carrying the fusible strip *g*, circuit-closer J, and branch line H, all arranged as described.

3. In a cut-out, a plug of insulating material carrying a fusible strip, said plug formed of two parts telescoped together and having a spring between the parts, which tends to force them away from each other in order to maintain good contact at the ends of the plug, as described.

885,068. DYNAMO-ELECTRIC MACHINERY. ANTHONY REKNAGEL, London, England, assignor to the Electric Car Company of America, Philadelphia, Pa. Filed Mar. 20, 1888. Serial No. 268,005. (No model.) Patented in England Mar. 20, 1885, No. 3,569.

885,068.

Claim.—1. In an electric motor or dynamo, a field-core having its polar ends united to polar extensions by bolted connections, in combination with a rigid frame to hold said field-cores and polar extensions rigidly in position to form the armature-space.

2. In an electric motor or dynamo, a field-core having its polar ends united to polar extensions by bolted connections, in combination with a rigid frame of non-magnetic material to hold said field-cores and polar extensions rigidly in position to form the armature-space.

3. In an electric motor or dynamo, a field-core having its polar ends united to polar extensions by bolted connections, in combination with a rigid frame of non-magnetic material on each end to hold said field-cores and polar extensions rigidly in position to form the armature-space, the armature, and the armature-shaft supported by the end frames.

4. In an electric motor or dynamo, a field-core having its polar ends united to polar extensions by bolted connections, in combination with a rigid frame of non-magnetic material on each end to hold said field-cores and polar extensions rigidly in position to form the armature-space, the armature, and the armature-shaft supported by the end frames.

5. In an electric motor or dynamo, a field-core having its polar ends united to polar extensions by bolted connections, in combination with a rigid frame of non-magnetic material on each end to hold said field-cores and polar extensions rigidly in position to form the armature-space, the armature, the armature-shaft supported by the end frames, a commutator on said armature-shaft, a brush-holder supported by said end frames, and brushes carried by said brush-holder.

6. In an electric motor or dynamo, a field-core made without yoke-joints and of horseshoes or U shape, having its polar ends united to polar extensions by bolted connections, in combination with a rigid frame to hold said field-cores and polar extensions rigidly in position to form the armature-space.

7. In an electric motor or dynamo, a field-magnet core of horseshoe shape made in continuous metal from pole to pole, in combination with pole pieces or extensions, and rigid frames to hold said pole-pieces and cores in a fixed relative position.

8. In an electric motor or dynamo, a field-magnet core of horseshoe shape made in continuous metal from pole to pole, with air-spaces, in combination with pole pieces or extensions and rigid frames to hold said pole-pieces and cores in a fixed relative position.

9. In an electric motor or dynamo, a field-magnet core of horseshoe shape made in continuous metal from pole to pole, in combination with a series of sections making up the pole pieces or extensions and forming the armature-space, said sections of each pole being separated laterally by air-spaces, and rigid frames to hold said pole-pieces and cores in a fixed relative position.

10. In an electric motor or dynamo, a field-core having its polar ends united to polar extensions formed of small pieces curved on their inner edges to form the armature-space, in combination with end frames forming standards and rigidly holding the parts together in a fixed relation.

11. In an electric motor or dynamo, a field-core having its polar ends united to polar extensions formed of small pieces extending toward each other from pole to pole and curved on their inner edges to form the armature-space, in combination with end frames forming standards and rigidly holding the parts together in a fixed relation.

12. In an electric motor or dynamo, the combination of two horseshoe or U shaped field-magnets having the polar extensions, such as E, extending toward each other and with their similar poles arranged in line, and frames exterior to the field-magnets forming standards and bolted or secured to said field-magnet cores to hold them in a fixed relation to each other.

13. In an electric motor or dynamo, the combination of two horseshoe or U shaped field-magnets having the polar extensions, such as E, a series of pointed projections of fine metal with interposed air-spaces extending toward each other and with their similar poles arranged in line, and frames exterior to the field-magnets forming standards and bolted or secured to said field-magnet cores to hold them in a fixed relation to each other.

14. In an electric motor or dynamo, the combination of two horseshoe or U shaped field-magnets having the polar extensions, such as E, extending toward each other and with their similar poles arranged in line, and frames of non-magnetic material exterior to the field-magnets forming standards and bolted or secured to said field-magnet cores at each end, to hold them in fixed relation to each other.

15. In an electric motor or dynamo, the combination of two horseshoe or U shaped field-magnets having the polar extensions, such as E, extending toward each other and with their similar poles arranged in line, frames exterior to the field-magnets forming standards and bolted or secured to said field-magnet cores to hold them in a fixed relation to each other, and bridging-pieces extending between the similar poles of the two field-magnets.

16. In an electric motor or dynamo, the combination of two horseshoe or U shaped field-magnets having the polar extensions, such as E, extending toward each other and with their similar poles arranged in line, frames exterior to the field-magnets forming standards and bolted or secured to said field-magnet cores to hold them in a fixed relation to each other, and bridging-pieces extending between the similar poles of the two field-magnets and formed of a series of parallel plates with air-spaces between them.

17. In an electric motor or dynamo, a field-magnet core formed with ductile magnetizable polar extensions bolted to it in grooves at its polar ends.

18. In an electric motor or dynamo, a field-magnet core formed of a ductile magnetizable metal and provided with ductile magnetizable polar extensions bolted to it in grooves at its polar ends.

19. In an electric motor or dynamo, a field-magnet core formed of a ductile magnetizable metal continuous or without yoke-joints and provided with ductile magnetizable polar extensions bolted or otherwise secured to them at their polar ends.

20. In an electric motor or dynamo, two U-shaped field-magnet cores having their similar poles arranged toward each other, in combination with bridging-pieces extending between similar poles to unite them, but separate from the field-magnet cores, and end frames forming standards and holding the field-magnet cores in position.

21. In an electric motor or dynamo, two U-shaped field-magnet cores having their similar poles arranged toward each other, in combination with bridging-pieces extending between similar poles to unite them, but of much smaller sectional area than the field-cores, and end frames forming standards and holding the field-magnet cores in position.

22. In an electric motor or dynamo, the combination of two field-magnets of U shape, having their similar polar ends opposed, brought close to the armature, and united by parallel bridging-pieces, substantially as set out, set down into the polar ends, and secured therein by bolts passing through said polar ends and bridging-pieces.

23. In an electric motor or dynamo, the combination of two field-magnets of U shape, having their similar polar ends opposed, brought close to the armature, and united by parallel, bridging-pieces, substantially as set out; set down into the polar ends, and secured therein by bolts passing through said polar ends and bridging-pieces, and end frames directly secured to the field-magnet cores to hold the parts rigidly together.

24. The combination, in a motor or dynamo, of two U or horseshoe shaped field-magnets placed opposite each other, and each formed of a continuous band of metal from pole to pole, avoiding yoke-joints, and uniting bridging-pieces connecting similar poles of said field-magnets together by being set in grooves in their ends and made flush with the surface thereof.

25. The combination, in a motor or dynamo, of two U or horseshoe shaped field-magnets placed opposite to each other, and each formed of a continuous band of metal from pole to pole, avoiding yoke-joints, and uniting bridging-pieces connecting similar poles of said field-magnets together, but at a fixed distance apart, and end frames bolted to the polar ends to hold all of the parts rigidly and with a fixed relation to each other.

26. In a dynamo-electric machine or motor, the combination of two U or horseshoe shaped field-magnets arranged with their similar poles in line, and two end frames of non-magnetic material forming standards and firmly secured to the said field-magnets to hold them in a fixed relative position with reference to each other to form a clear armature-space.

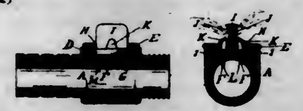
27. In a dynamo-electric machine or motor, the combination of two U or horseshoe shaped field-magnets arranged with their similar poles in line, two end frames of non-magnetic material forming standards and firmly secured to the said field-magnets to hold them in a fixed relative position with reference to each other to form a clear armature-space, an armature, and an armature-shaft supported in said end frames and independent of the field-magnets.

28. The combination of the two field-magnet cores A A, united by bridging-pieces *b*, frames D D, having supporting-feet and bearings *d* and bolted at K to the field-magnets, an armature-shaft, F, supported in the bearings, and an armature on the shaft.

29. The combination of the two field-magnet cores A A, united by bridging-pieces *b*, frames D D, having bearings *d* and bolted at K to the field-magnets, with distance-pieces *k* to form air-spaces between the end frames and magnets, an armature-shaft, F, supported in the bearings, and an armature on the shaft.

30. The combination of the two field-magnet cores A A, united

by bridging-pieces *b*, having extensions E, bolts C, for uniting said bridging-pieces to the polar ends of the magnet-cores, frames D D, having supporting-feet and bearings *d* and bolted at K to the field-magnets, an armature-shaft, F, supported in the bearings, and an armature on the shaft.



31. In a dynamo-electric machine or motor, the combination, in an armature-core, of the plates H, arranged in circles and parallel rings, with small air-spaces *h'* between adjacent sections of the same ring, and clamping-bolts I, extending through said sections to unite them into a compact annular cylinder or core.

32. In a dynamo-electric machine or motor, the combination, in an armature-core, of the plates H, having polar extensions A, arranged in circles and parallel rings, with small air-spaces *h'* between adjacent sections of the same ring, and clamping-bolts I, extending through said sections and in line with the polar extensions to unite them into a compact annular cylinder or core.

33. In a dynamo-electric machine or motor, the combination, in an armature-core, of the plates H, arranged in circles and parallel rings, with small air-spaces *h'* between adjacent sections of the same ring, clamping-bolts I, extending through said sections to unite them into a compact annular cylinder or core, and end frames or disks of non-magnetic material, through which the bolts I pass and by which the core is secured to the armature-shaft.

34. In a dynamo-electric machine or motor, field-magnet cores forming a continuous magnetic belt around the armature, having two diametrically-opposite parts brought close to the surface of the armature to form poles and coils upon said parts which are intermediate to the pole parts, said magnetic belt being formed of parts linked together, in combination with non-magnetic frames forming standards secured to said magnetic linked-belt core to hold it rigidly together.

385,069. DEVICE FOR SPRINKLING LAWNS. R. JESSIE H. RICHARDSON, Detroit, Mich. Filed Mar. 8, 1888. Serial No. 266,536. (No model.)

Claim.—1. The combination, with the coupling member formed with a hollow boss, of the cap secured to said boss and provided with holes communicating with the interior of said member, and a sprinkling-nipple in said boss formed with an opening communicating with the interior of the coupling, substantially as described.

2. The combination, with a pipe or hose coupling, of the boss C, formed thereon, the disk G, having the thumb-piece I and sprinkler-nipples K, the deflectors J, formed on the thumb-piece I, and the retaining-cap E, all arranged substantially as and for the purposes set forth.

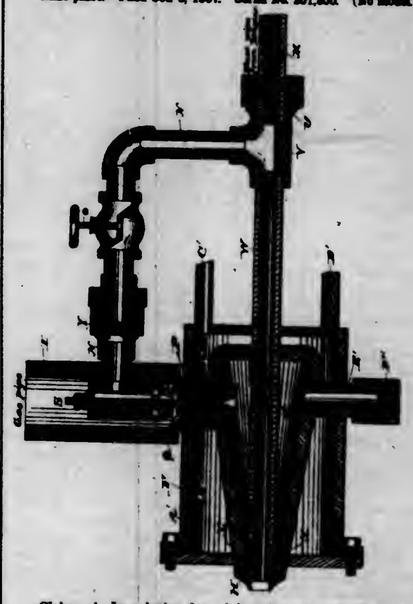
3. The combination, with a pipe or pipe-coupling formed with a boss, as described, of the cap fitted in said boss and communicating with the interior of the pipe, and a disk, G, loosely secured in said boss by said cap and provided with sprinkling-nipples, and provided with a thumb-piece formed with concave deflectors, substantially as and for the purpose specified.

385,070. FEATHER DUSTER. GILBERT M. RICHISON, Chicago, Ill., assignor, by mesne assignments, to Leonard A. Watson, Ashtabula, Ohio. Filed Sept. 17, 1874.

Claim.—1. As a new and useful article of manufacture, a soft, light, feather duster made of stiff heavy feathers reduced in weight and rendered more pliable by splitting or shaving off their ribs, substantially as described.

2. As a new and more useful and perfect article of manufacture, a soft, light, and flexible feather duster made of stiff heavy feathers, rendered soft, light, pliable, and elastic by the removal of the ribs of their shafts and withing the backs thereof, substantially as described.

385,071. POTATO-DIGGER. CYRUS ROSSETTE, Three Rivers, Mich. Filed Nov. 12, 1887. Serial No. 254,972. (No model.)



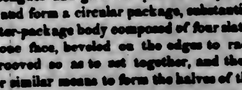
Claim.—1. In a potato-digger, a revolving cage consisting of a head and substantially straight spring-tines secured thereto and projecting obliquely or spirally therefrom to the rear, with their rear ends unsupported, substantially as described.

2. In a potato-digger, the combination, with the cage revolving on circumferential bearings, of a plow independent of said cage at an angle to the line of draft and to one side of the center of the draft, with its point to land, and provided with an extension, U, serving as a scraper, substantially as described.

3. The combination, with the supporting-wheels, axle, and frame of a potato-digger, of the digging-plow independently secured thereto, and provided with the raising and lowering lever Q, and of a revolving cage suspended by means of chains, straps, or equivalents, a hinged frame having suitable drive-pulleys over which said chains or straps pass, and a lever for raising and lowering said hinged frame, all arranged to operate substantially as described.

385,072. DEVICE FOR MIXING AIR AND GAS FOR FURNACES. HENRY SCHLIEBE, Lebanon, Pa., assignor of one-half to Jacob H. Grove, same place. Filed Oct. 8, 1887. Serial No. 251,850. (No model.)

Claim.—1. In a device for mixing air and gas for furnaces, the combination of a gas-receiving chamber having a nozzle on the discharge end thereof, an air-supply pipe extending longitudinally through said chamber and provided with a conical end, a gas-supply pipe and an air-supply pipe communicating with said gas-chamber, and an automatic valve for controlling the supply of gas and air to the gas-chamber, substantially as described.



2. In a device for mixing air and gas for blast-furnaces, the combination of a blast-receiver, a conical gas-receiving chamber or heater having a nozzle projecting through one of the end walls of the blast-receiver and provided with a concave outer surface, a major air-supply pipe passing through the gas-chamber, and a minor air-supply pipe communicating with said chamber near its large end, a gas-supply pipe, a compound automatic valve for controlling air and gas supplied to the gas-chamber, and a valve in the minor air-supply pipe, substantially as described.

3. In a device for mixing air and gas for furnaces, a gas-receiving chamber having a tapering discharge end, a gas and air supply communicating with said chamber, and an automatic check-valve controlling the supply of gas and air, in combination with an adjustable air-pipe extending through the gas-chamber and discharging into the nozzle thereof, substantially as described.

4. In a device for mixing air and gas for blast-furnaces, the combination of a blast-receiver, a blast-heater having a nozzle projecting into said receiver, a gas-supply pipe communicating with a furnace and the blast-heater, an air-supply pipe, also communicating with said heater, an automatic valve for controlling the supply of gas and air to the heater, and a main blast-pipe extending through the heater and discharging into the blast-receiver, substantially as described.

5. In a device for mixing air and gas for blast-furnaces, a blast-heater, a bustle-pipe, and tuyeres, in combination with a blast-receiver between the heater and the bustle-pipe, a gas-supply pipe communicating with the furnace-stack and the heater, an auxiliary air-supply pipe, and an automatic valve for cutting off the gas and air, and a blast-supply pipe passing through the heater and discharging into the blast-receiver, substantially as described.

385,073. FINGER-RING. WILLIAM P. SIMMONS, Newark, N. J. Filed Sept. 20, 1887. Serial No. 250,351. (No model.)

Claim.—In a ring of the character described, the finger-band having a perforated seal-head thereon with two or more perforations therethrough for the reception of the hollow tubular rivets, in combination with a stone, similarly perforated through its face or lesser diameter, to be mounted thereon, and the monogram or other device provided with tubular rivets, as described, said rivets passing through the stone and finger-band, upset within the latter, whereby all the parts are rigidly secured together, as set forth.

385,074. PEDAL FOR BICYCLES. WILLIAM H. SMITH, Washington, D. C., assignor to the Smith National Cycle Manufacturing Company, of Colorado. Filed Feb. 20, 1888. Serial No. 265,086. (No model.)

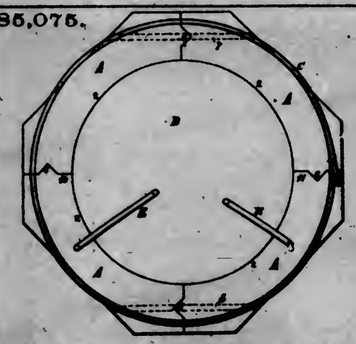
Claim.—1. In a bicycle or analogous machine having a seat for the rider and propelling-cranks below the seat and on opposite sides of the seat, pedals applied to said cranks and having top surfaces higher at the outer than at the inner ends, substantially as described as shown.

2. In a pedal for bicycles and kindred machines, the combination of a spindle and a rotary frame mounted thereon and provided with a foot-receiving surface higher at the outer than at the inner end.

3. The spindle and the rotary frame, in combination with the two tapering foot-pieces *d*, applied thereto.

4. In a pedal, the soft-metal spindle, in combination with the hardened grooved ring fixed on one end, the hardened grooved plate screwed on the other end, the check-nut, the rotary frame having foot-receiving surfaces, and the grooved end plates, *d*, and the balls seated in the grooves, substantially as described.

5. In a bicycle-pedal, the spindle and the circular grooved plates d^2 and d^{11}, secured thereon, in combination with the pedal-frame having its end plates recessed to fit over and around the edges of plates d^2 d^{11} and provided with annular grooves, and the balls seated in the grooves between the plates, as described.

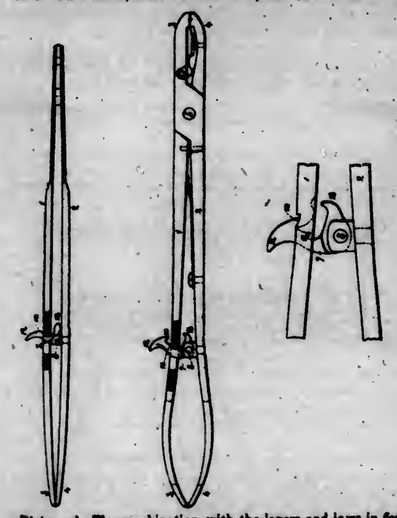


385,075. PACKAGE FOR BUTTER OR SIMILAR MATERIAL. SAMUEL SMITH, Pittston, Pa. Filed Feb. 23, 1888. Serial No. 264,951. (No model.)

Claim.—1. The butter-package body made of slats the inner surfaces of which are concave, the edges beveled upon radial planes, and provided with tongues and grooves upon the respective edges, so as to set together and form a circular package, substantially as set forth.

2. The butter-package body composed of four slats, each of which is concave on one face, beveled on the edges to radial planes, and tongued and grooved so as to set together, and the slats united in pairs by nails or similar means to form the halves of the package, substantially as set forth.

3. The package for butter or similar materials, consisting of a body

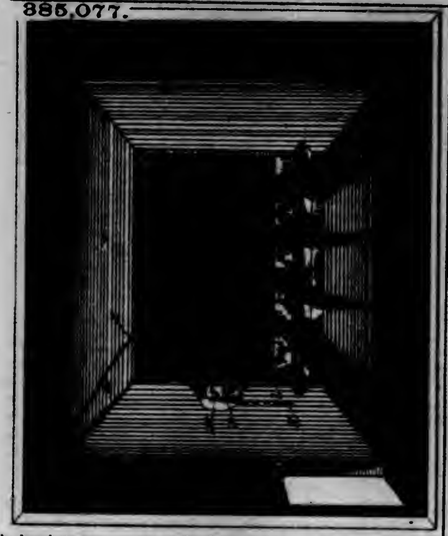


385,075.

formed of slats with a concave inner surface, so as to form an open cylinder when set together, the edges of the slats being tongued and grooved and the exterior surface beveled near the ends, in combination with movable hoops driven upon such beveled ends to hold the slats firmly together, substantially as set forth.

4. A butter-package body having two separable halves, each half being composed of two or more longitudinal slats tongued and grooved on the edges and fastened together, substantially as specified.

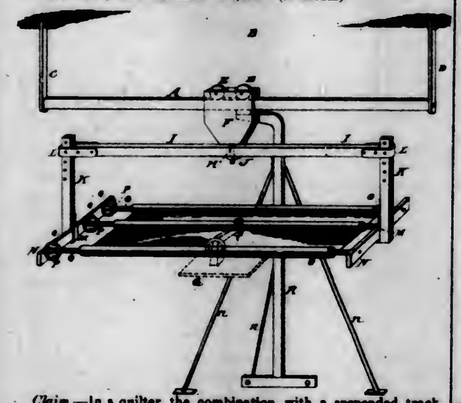
385,076. CLAMPING DEVICE FOR FORCEPS, &c. FREDERICK A. STOELHARN, Brooklyn, assignor to George Tiemann & Co., New York, N. Y. Filed Jan. 9, 1888. Serial No. 260,142. (No model.)



Claim.—1. The combination, with the levers and jaws in forceps or nippers, of a clamping-latch pivoted to one of the levers and having a catch or latch to hold the other lever, and a finger that is acted upon by the moving lever to swing the latch automatically, substantially as set forth.

2. The combination, with the levers and jaws in forceps or nippers, of a clamping-latch and a pivot for connecting the same to one of the levers, such clamping-latch passing through a mortise in the other lever, and having one or more catches and a thumb-piece and the finger 13, whereby the clamp is rendered automatic as the forceps are closed, substantially as set forth.

385,077. ANIMAL-RELEASING DEVICE. JOHN D. SULLIVAN and CHARLES A. SULLIVAN, Windsor, Ontario, Canada. Filed Mar. 20, 1888. Serial No. 267,831. (No model.)

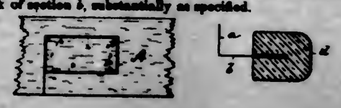


Claim.—The combination of a plurality of brackets, C, a plurality of pins, D, one for each bracket, a ring held in each bracket by the pin therein, an elbow-lever connected with each pin, and a cord connecting all the levers for drawing the pins, with a cord, M, connected with one of the rings, and a detachable support attached to the building and embracing and holding said cord M, but disconnected therefrom, whereby when the pins are drawn the rings are released from

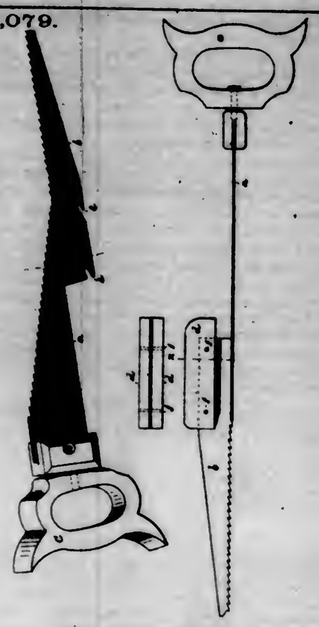
385,077.

the brackets and are free to be drawn out by said cord M, and the drawing of the cord withdraws the supports and removes them from engagement with the cord, substantially as described.

385,078. QUILTING-FRAME. CHARLES A. WEHAL, Savoy, TEX. Filed Oct. 4, 1887. Serial No. 251,432. (No model.)

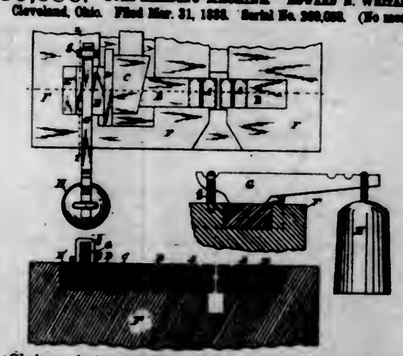


Claim.—In a quilter, the combination, with a suspended track-beam, of a block, F, carrying at the upper end journaled wheels E E which travel on said beam, a quilting-frame swiveled to said block and having inside loops at the lower end, and the quilting-roll end plates, N N, movable through said loops, as shown, whereby the quilt may be balanced, turned in a horizontal plane to a greater or less degree, and fed to the sewing-machine, as described.



385,079. SAW. ADOLPH WETHAR, Brooklyn, N. Y. Filed Feb. 20, 1888. Serial No. 265,726. (No model.)

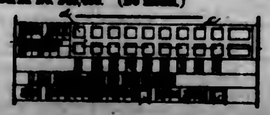
Claim.—1. The combination of a saw-handle with a saw-blade made in two serrated sections, *a b*, that are placed at right angles to each other, the sections *a b* overlapping at the center of the saw-blade only, while above and below the overlapping portion each section of the saw-blade lies in one plane only, substantially as specified.



2. The combination of a saw-blade made in two sections, *a b*, placed at right angles to each other, with a swiveled handle, *c*, secured to section *a*, and with a removable handle, *d*, adapted to be secured to the back of section *b*, substantially as specified.

385,079.

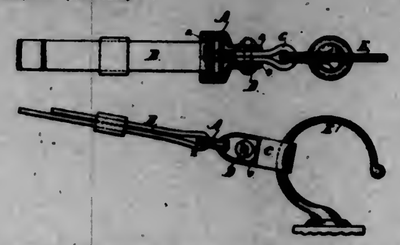
385,080. BOLT-HEADING MACHINE. EDWARD H. WHITAKER, Cleveland, Ohio. Filed Mar. 31, 1888. Serial No. 269,093. (No model.)



Claim.—1. In a heading-machine, a wedge interposed between the die-actuating mechanism and a stationary inclined face rigidly supported by the bed or frame of the machine, in combination with an adjustable weight or spring for maintaining said wedge in position, substantially as described.

2. In a heading-machine, the wedge E interposed between the die-actuating mechanism and a stationary inclined face, *c*, borne upon or rigidly supported by the bed or frame of the machine, in combination with the lever G and weight H, substantially as described.

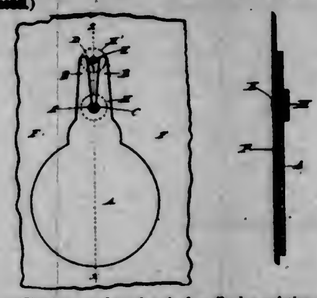
3. In a heading-machine, the combination, with the die-actuating mechanism, of the wedge E, the inclined face *c*, the lever G, and weight H, all arranged and operating substantially as described.



4. In a heading-machine, the combination, with the die-actuating mechanism, of the wedge E, block E' with inclined face *c*, lever G, and weight H, all arranged and operating substantially as described.

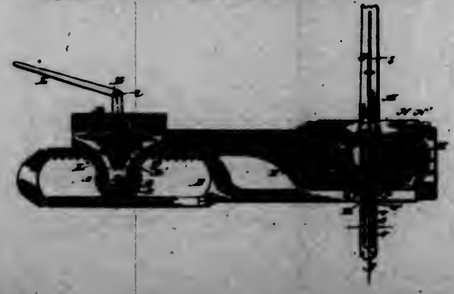
385,081. ART OF PRINTING. MOSES B. WALKER, Chicago, Ill., assignor to himself and JAMES J. WEST, same place. Filed Sept. 12, 1887. Serial No. 249,659. (No model.)

Claim.—As an improvement in the art of printing, the method of preparing stereotype-plates, which consists in providing matter from which the stereotype-plate is to be made with blank blocks which are of less height than the type and are provided with holes adapted to receive type, and then making a stereotype-plate from such matter as provided with such blocks, and then inserting type in the holes in the plate, substantially as and for the purposes specified.



385,082. CHECKREIN ATTACHMENT FOR HARNESS. BENJAMIN J. WEST, Brooklyn, assignor to himself, HENRY C. PALMER, Schenectady, and VALENTINE KOCH, New York, N. Y. Filed Mar. 28, 1888. Serial No. 268,543. (No model.)

Claim.—1. The combination, with the checkrein B and saddle-hook E, of the quadrangular metal frame A, having a bar, 2, around which the rein passes, and cheek-pieces 3 and 4, and the folded leather loop C, for the saddle-hook, and a rivet or screw passing through the cheeks and the folded strap and connecting the parts together, substantially as set forth.



2. The combination, in a checkrein attachment, of a metal frame having a bar, 2, around which the rein passes, and cheek-pieces 3 4, and projections 5 6 on opposite surfaces of the said cheek-pieces, the folded leather loop C, adapted to pass between the cheek-pieces and having its ends notched for the projections 5 6, and a rivet or screw passing through the cheek-pieces and folded loop C and connecting the parts together, substantially as set forth.

385,083. TAG. THEODORE J. VEIT, Amsterdam, N. Y., assignor of three-fourths to THOMAS F. KENNEDY, THOMAS F. KYNE, and CHARLES C. VEIT, all of same place. Filed Mar. 26, 1888. Serial No. 268,927. (No model.)

Claim.—The improved tag herein described, consisting of a blank of paper or other suitable material having the hole or perforation C opening into the diverging aperture D, all substantially as set forth.

385,084. MECHANICAL MOVEMENT. BENJAMIN F. ARMSTRONG, Myers, Ia. Filed Feb. 4, 1888. Serial No. 263,269. (No model.)

Claim.—1. In an apparatus for converting motion, the combination of the shaft, a toothed wheel loose thereon, a pawl-support fixed to said shaft, a double-ended pawl supported thereon and adjustable, whereby either end may be set to engage the toothed wheel, and a pitman having a rack engaging the toothed wheel, substantially as set forth.

2. In an apparatus for converting motion, the combination of the shaft, a toothed wheel and a pawl-support thereon, a double-ended pawl carried by the pawl-support, a pawl-tripper having a portion arranged to engage the pawl and movable, whereby is may adjust either end of said pawl into operative position, and a pitman having a rack to engage the toothed wheel, substantially as set forth.

3. In an apparatus for converting motion, the combination of the shaft, the toothed wheel thereon having a recess in its outer face, the pawl-support, also on said shaft and fitted at its inner end in the recess in the toothed wheel, the double-ended pawl carried by said support and adjustable, whereby either end may be set to engage the toothed wheel, and the pitman having a rack engaging the toothed wheel, substantially as set forth.

4. In an apparatus for converting motion, the combination of the shaft, the toothed wheel thereon, the pitman having a rack engaging said toothed wheel, the pawl-support, the double-ended pawl held adjustably to said support, and the pawl-tripper comprising a ring journaled on the pawl-support and a projection extended inwardly from the ring and arranged to engage the pawl, whereby by the partial turning of the ring the pawl may be adjusted to set either of its ends in operative position, substantially as set forth.

5. In an apparatus for converting motion, and in combination with the shaft, a toothed wheel and a pawl-support on such shaft, a double-ended pawl, and a pawl-tripper comprising a ring journaled on the pawl-support, a projection extended inwardly from said ring, and a spring for actuating such projection, substantially as set forth.

6. In an apparatus for converting motion, the combination of a shaft, a toothed wheel, and a frame-support thereon, a double-ended pawl carried by said pawl-support, a pawl-tripper journaled on the pawl-support and comprising a ring, I', having an opening or socket, *i'*, and guides *j* at the outer end of said opening, a cover-plate, J, movable in said guides over the outer end of opening *i'*, the projection *i*, fitting at its outer end in said opening or socket *i'*, and a spring arranged in said socket and bearing between the projection *i* and the cover-plate J.

7. An apparatus, substantially as described, for converting motion, comprising the shaft, the toothed wheels thereon having their outer faces formed with recesses F, the pawl-carriers on the shaft, and fitted at their inner ends in the recesses F, and provided at such inner ends with recesses *g*, the pawls H, held in said recesses *g*, and adjustable, as described, the pawl-trippers having rings journaled on the pawl-carrier and having projections arranged to engage the pawls, and the slotted pitman having opposite racks, as specified.

8. In an apparatus, substantially as described, the combination of the pitman, the lever to which such pitman is connected, a frame in which such lever is pivotally supported, whereby it may be oscillated, and cushions arranged to be engaged by said lever at the ends of its stroke, substantially as and for the purposes specified.

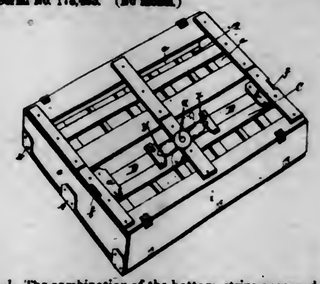
9. In an apparatus, substantially as described, the combination of a lever having a toothed segment, *m*, and a toothed roller, *m'*, and a frame, N, having racks *n n'*, arranged opposite each other, such racks *n n* being similar, whereby the lever may be reversed, as described.

10. In an apparatus for converting motion, the combination of the lever having openings or sockets O and the guide or keeper frame, the pitman, the spring-actuated locking-stud movable into and out of the sockets O, and the three armed or branched lever connected at the juncture of its arms with the stud, and adapted, when tilted in either direction, to release said stud from the sockets in the lever, substantially as set forth.

11. In combination with the pitman, the main lever, having sockets O and the spring-actuated locking-stud, the lever R, having arms *r r r'*, and connected at the juncture of said arms to the stud, and a rod connected at one end to the arm *r'* of the lever R and extended along the handle end of the main lever, substantially as and for the purposes specified.

12. The combination of, the main lever, having sockets O and guide or keeper frame O', having notches *o*, the pitman, the connecting-block, the spring-actuated stud arranged to enter sockets O, the lever R, having arms *r r r'* and connected at the juncture of such arms to the said stud, and the rod connected with the arm *r'* of lever R, substantially as set forth.

13. In an apparatus, substantially as described, the combination of the shaft, the toothed wheel thereon, the pawl support or carrier, the double-ended pawl, the pawl-tripping ring journaled on the pawl-support, and having a projection arranged to engage the pawl, and having an internal set of notches, and a spring-actuated stud supported in the pawl-carrier and engaging and movable from one to the



other of the internal notches of the pawl-tripper ring, substantially as set forth.

14. The combination of the shaft, toothed wheel, and pawl-support thereon, the pawl, the pawl-tripper having a ring provided with internal notches, and the spring-actuated stud supported in the pawl-support and arranged to engage the said internal notches, and having at its outer end an extension projected along the outer side of the pawl-tripping ring, substantially as set forth.

15. The combination, with the framing, the shaft, the toothed wheels, the pawl-support, and the pawl-tripper ring having an outwardly-extended projection or projections, of a bar or lever supported on the framing and having an arm or portion movable into the path of such projection, whereby to effect an adjustment of the pawl-tripper, substantially as and for the purposes specified.

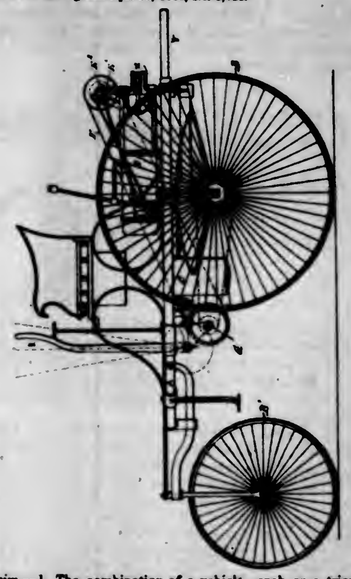
16. In an apparatus, substantially as described, the combination of the lever M, having openings O and dovetail groove P' and the guide-frame O', the block P, fitted in said groove P', the pitman, the spring-actuated stud entering the openings O, and a lever for operating said stud, substantially as set forth.

385,085. PORTFOLIO. GEORGE AUTE, Lacon, Ill. Filed Sept. 28, 1886. Serial No. 213,463. (No model.)

Claim.—1. The combination of the bottom, strips *c* secured thereto, the hinged covers, bails or staples *f*, secured to the strips *c*, sliding bars held on the covers and adapted to engage the staples *f*, and a turn-button on the covers to normally hold said sliding bars in engagement with said staples, substantially as specified.

2. The combination of the bottom, strips *c* secured thereto, the hinged covers, bails or staples *f*, secured to the strips *c*, and sliding bars D D, adapted to engage the staples *f* and provided with the blocks *a b c d*, the ends of which rest on the strips composing the covers, substantially as specified.

3. The herein-described portfolio, comprising the slatted bottom A, having the rigid sides *c* and the hinged sides *i*, the slatted cover forming the top for the portfolio, said cover being made in overlapping sections, one section being hinged to one of the rigid sides *c*, and the other section being hinged to the side *i*, the staples *f*, secured to the rigid sides, and the sliding bars on one of said sections engaging the staples *f*, as set forth.



4. In a portfolio, the slatted bottom A, the rigid sides *c*, secured around three of the edges of the bottom A, the hinged side *i*, secured to the other edge of the bottom, and the slatted cover, one section of which is secured to one of the rigid sides, and the other section is secured to the hinged side, the sections of the cover being secured together, as set forth.

385,086. ANIMAL-TRAP. JAMES T. BELDEN, Sparta, Wis. Filed Apr. 12, 1888. Serial No. 270,480. (No model.)

Claim.—The animal-trap herein described, consisting of the upper and lower sections, A B, the upper section having its entire bottom or floor composed of two tilting parts, *a b*, each having a weight on its outer under side, and the section *a* having a notched depending lug, and the section *b* having the downwardly-curved plate *d'*, adapted to engage the notch on the lug of the said adjacent section, substantially as specified.

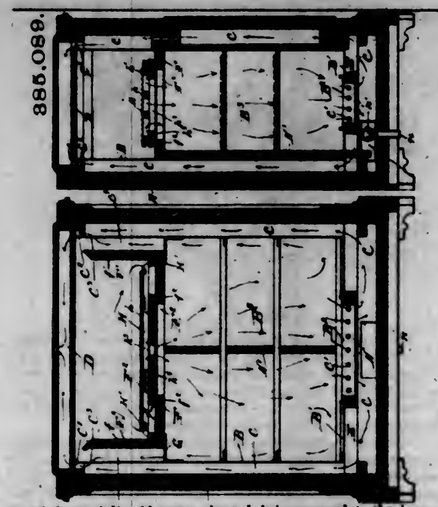
385,087. SELF-PROPELLING VEHICLE. CARL BENZ, Mannheim, Baden, Germany. Filed July 27, 1886. Serial No. 209,269. (No model.) Patented in England Apr. 26, 1886, No. 5,720.

Claim.—1. The combination of a vehicle—such as a tricycle—with a motor having its crank-shaft *x* placed in a vertical position and its fly-wheel *y* revolved in a horizontal plane, substantially as shown and described.

2. The lever 9, in combination with the devices 20 and 21, the shifter-bar 10, belt F, and fast and loose pulleys 15 16, the whole combined, constructed, and arranged so that by the simple manipulation of the one lever 9 the mechanism may be started, stopped, or the brake applied, substantially as described and set forth.

385,088. DRILLING-TOOL. ALEXANDER BENEIX, Brooklyn, N. Y. Filed Apr. 25, 1882. Serial No. 271,776. (No model.)

Claim.—1. A drilling-tool formed with a shank, A, a centering-point, B, end cutting-edges, C D, and straight side reaming-edges, F G, substantially as shown and described.

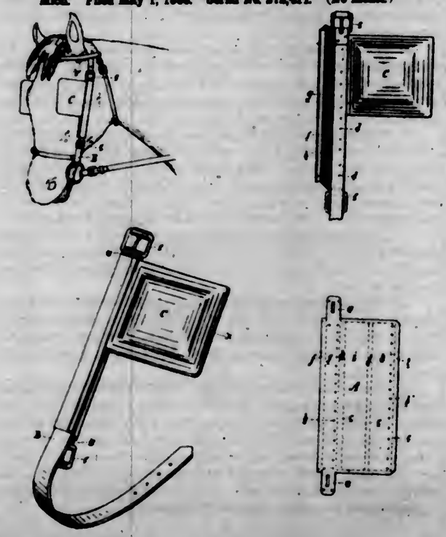


2. A drilling-tool formed with a shank, A, a centering-point, B, end cutting-edges, C D, converging to the point B, and straight longitudinal side reaming-edges, F G, terminating at the outer ends of the end cutting-edges, C D, substantially as shown and described.

3. A drilling-tool formed with a shank, A, a centering-point, B, opposite end cutting-edges, C D, and parallel and diametrically-opposite side reaming-edges, F G, the surface between which is depressed and rises to the surface of the shank A by an incline, I, substantially as shown and described.

385,089. REFRIGERATOR. CHARLES A. BLEES, Michigan City, Ind. Filed Aug. 20, 1887. Serial No. 247,420. (No model.)

Claim.—1. In a refrigerator, the combination, with its ice-pan and drip-pipe N', of a water-pan, N, into which said drip-pipe extends, and a discharge-pipe, *s*, projecting into the water-pan, provided with a float-valve, *s'*, said drip-pipe extending below the orifice of said discharge-pipe and said float-valve operating to close the discharge-pipe except when the water rises above its proper level in said water-pan, substantially as specified.



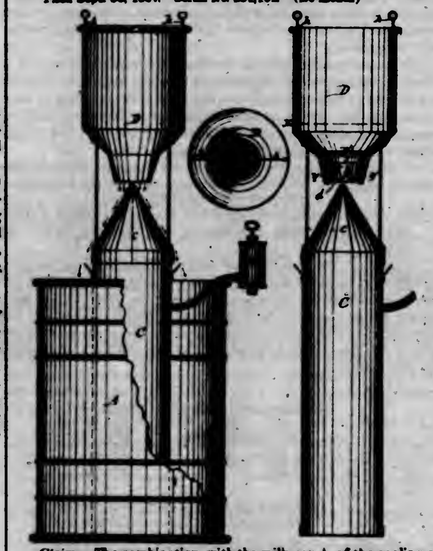
2. The combination, in a refrigerator having double walls at sides, top, and bottom and an air-space between them, of a refrigerating-chamber and an ice-chamber above said refrigerating-chamber, an ice-platform, and an ice-rack, H, provided with upper and lower

metal sheets, A A', said upper sheet, A, being secured to the ice-rack H by guides A^3, attached to the ice-rack at its edges, and guide-grooves A^4 at the edges of said metal sheet A, so that said sheet-metal cover A may be removed from the ice-rack, substantially as specified.

3. The refrigerator having an outer non-conducting wall and an inner metallic or conducting wall, with a continuous or connected air-space between the same at sides, top, and bottom, said inner wall having a central ventilator-opening through the floor or bottom thereof, and said outer wall having a ventilator-opening through its top or cover, said ventilator-openings communicating together through the air-space between said walls, a refrigerating-chamber, and an ice pan or chamber above said refrigerating-chamber, said ice pan or chamber having air spaces or passages between its ends and said inner metallic wall of the refrigerator, the ice-platform or bottom of the ice-chamber being of wood and provided with a central opening, and said refrigerator being furnished with a hollow ice-rack, H, provided with a central opening, A^2, to permit the cold air from the ice to pass centrally downward through the refrigerating-chamber, and said inner sheet-metal wall B being furnished with ventilator-openings C^3, communicating between the space C and the space C^4 between the ends of the ice-platform and the inner wall, substantially as specified.

385,090. CHECK-PIECE FOR BRIDLES. OSCAR BOTSFORD, Bureka, Mich. Filed May 1, 1888. Serial No. 272,411. (No model.)

Claim.—1. The check-piece consisting of the sheet-metal blank tubularly folded and provided with buckles secured to the ends thereof by ears formed on the blank, substantially as specified.



2. The check-piece consisting of a sheet-metal blank tubularly folded, in combination with a billet secured within the fold of each blank, substantially as described.

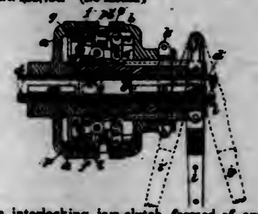
3. The check-piece consisting of the sheet-metal blank A, tubularly folded and provided with buckles secured to the ends thereof by the ears *a*, formed on the blank, in combination with the billet B, secured within the fold of the blank and carrying the blinder, all arranged substantially as described.

4. The check-piece consisting of the sheet-metal blank A, tubularly folded and provided with the re-enforced ends and the buckles secured thereto by straps formed on the blank, and the billet secured thereto by tacks or rivets between the tubular fold and an outer fold of said blank, substantially as described.

5. As an improved article of manufacture, the check-piece formed of sheet metal folded and provided with a billet inclosed within a fold of the sheet metal and secured thereto by tacks or rivets concealed within folds of the sheet metal, substantially as described.

385,091. MILK-STRAINER. ALBERTUS BOUTELL, Leeds, N. Y. Filed Sept. 30, 1887. Serial No. 251,101. (No model.)

Claim.—The combination, with the milk-can A, of the cooling-can C, the conical cover *c* on the top of the cooling-can, the strainer D supported above the cover *c*, and the plate *a* in the strainer, provided with the aperture *b* over the apex of the cone, substantially as described and shown.

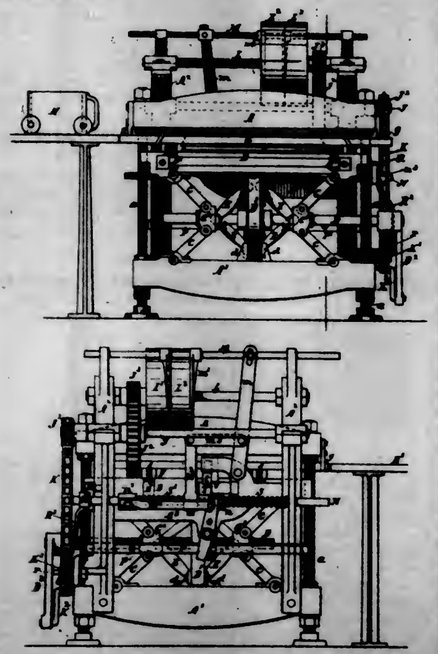


385,092. SWEAT-BAND FOR HATS. THOMAS W. BRACHER, New York, N. Y. Filed Dec. 22, 1887. Serial No. 258,642. (No model.)

Claim.—1. A soft-edge hat-sweat made of single thickness throughout and combined with the doubled flexible backing or slip B, placed along its side and also along the raw edge of the single-thickness band, substantially as described.

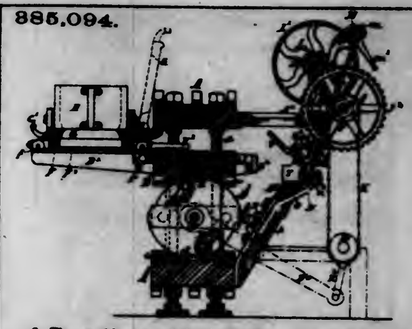
2. A soft-edge hat-sweat made of single thickness throughout and having a doubled flexible backing or slip, B, placed along its side and also along and covering the raw edge of the band, said backing being held to the band by threads that pass over the doubled edge of the backing and the band and through the band and doubled parts of the backing, thereby holding the part of the backing between its doubled edge and the perforations for the thread in a thread-loop, substantially as described.

385,093. CLUTCH. JOHN BOOTHBY, Chicago, Ill. Filed Oct. 13, 1887. Serial No. 252,756. (No model.)



Claim.—1. An interlocking jaw-clutch formed of opposed and toothed crown-wheels, of which one is fixed and the other movable longitudinally on the shaft, in combination with a friction-clutch operating on the cylindrical surface of the fixed crown-wheel through levers fulcrumed between said crown-wheels, connected at one end to said friction-clutch and at the other to the movable crown-wheel by connecting mechanism, whereby the friction-clutch is first and the jaw-clutch next engaged and the friction-clutch released, and, conversely, the jaw-clutch first released and the friction-clutch engaged and next released, each series of acts occurring by moving the loose crown-wheel first in one and then in the opposite direction, substantially as specified.

2. In combination with the line-shafts *d d'* and crown-wheel *a*, a sleeve, *c*, carrying friction-segments against the cylindrical surfaces of the crown-wheel *a*, and levers fulcrumed between their ends on said sleeve, said levers being connected at one end to the said friction-segments and at the other to the movable crown-wheel by intermediate mechanism, substantially as specified.



3. In a clutch, the combination of a crown-wheel, *a*, friction-segments *g*, toggles o^1, block o^2, and screw *g*, substantially as specified.

385,094. MOLDING-PRESS FOR OIL-CAKES. OSCAR P. DUNNELL, Worcester, Mass. Filed Sept. 26, 1887. Serial No. 250,703. (No model.)

Claim.—1. The combination, with the fly-table, the press-head, and follower, the press-operating shafts and gear, driving-pulleys, and automatic shipper for stopping and starting the press, of the mold-carrier having a lug that trips the starting-shipper lock when said mold-carrier is introduced or inserted within the press, whereby the press is put into action automatically by the operation of inserting the mold-carrier.

385,094.

2. The combination of the press-follower provided with projecting brackets at front and rear, the pivoted yielding sections I, and springs I', arranged within said brackets, and the mold-carrier frame having front and rear projections provided with supports or truck-wheels F, that rest upon the yielding sections when said frame is in the press, substantially as and for the purpose set forth.

3. The mechanism for applying pressure, consisting of oppositely-directed arms E, having spherical or universal bearing-joints at their ends, the outer ends of which connect with the parts against which pressure is exerted, and their inner ends working in combination with a rotative wheel or operator, whereby said inner ends are caused to move in a circular arc in a plane substantially perpendicular to the direction of the pressure or movement of their outer ends, substantially as set forth.

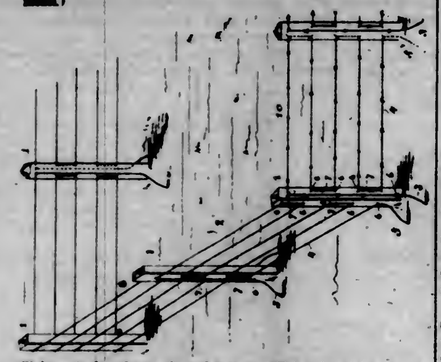
4. The combination, with the follower B and head A', of the shaft D, carrying the wheel or socket-plate D', the knuckle-joint blocks C, provided with sockets, the arms E, disposed between said wheel and the knuckle-joint blocks, and the arms C between said blocks and the pressing-head and follower, substantially as and for the purpose set forth.

5. The combination, with the pressing-heads and follower, the knuckle-joint C, pressing-arms C, arms E, wheel D', and shaft D, of the fly-table G, the mold-carrier frame F, supporting-trucks *f'*, and means, substantially as described, for operating said shaft.

6. The combination of the knuckle-joint blocks C, arms C C, pressing-follower B, and head A, provided with lugs *d*, the actuating-shaft D, passing through said knuckle-joint blocks, the wheel or socket plate D', fixed on said shaft and having a cam-shaped periphery confined between said lugs, and the arms E, socketed or universally jointed at their respective ends between the said wheel and said knuckle-joint blocks, substantially as and for the purpose set forth.

7. The combination, with the cake-forming press-head and pressing-follower operated by the knuckle-joint arms and shaft D, of the arm D^2, chain K, link K^1, sprocket-wheels K' and J', and operating-shaft J, with driving-gear for imparting motion to said shaft, for the purposes set forth.

8. The combination, with the press-head and pressing-follower, its operating-shaft D and arm D^2, of the chain K, link K^1, sprocket-wheels J' and K', shaft J, gears J^2 J^3, shaft L, pulleys L' L^1, shipper M *m'*, and spring-levers and trip-dogs arranged for automatically operating said shipper, substantially as set forth.



9. In combination with the press-heads, pressing-follower, press-operating knuckle-joint arms, and mold-carrier frame, the bar N, shipper-actuating arm M^3, springs S S', collars *n*, *n'*, and n^2, dogs R and T, setting-lever O, connection P, actuating said setting-lever from the knuckle-joint, the lifting-lever V, tripping-arm *v'* on said mold-carrier, and latch *t*, substantially as and for the purposes set forth.

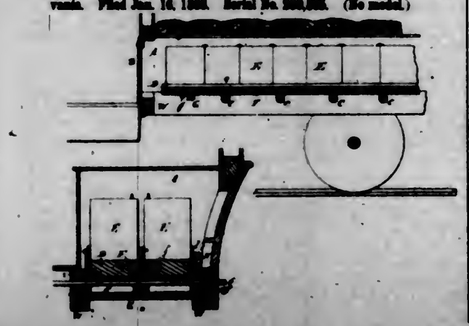
10. The dog R, having an arm, R', in combination with the press-operating arm D^2, provided with a lug or pin, *r*, and spring-actuated bar N, having the collar or stop device n^2, substantially as and for the purpose set forth.

11. The combination of the partially-rotative wheel D' and the knuckle-joint blocks C, each having bearing-sockets thereon, and the arms E, disposed in oppositely-directed pairs, with their respective ends sustained in said bearing-sockets, substantially as and for the purpose set forth.

12. The pressing-follower having depressed grooves or guideways across its upper surface and attached brackets or extensions having upon their tops guideways or tracks disposed in continuation of said grooves, and provided with yielding or depressible sections at front and rear of said follower, in combination with a mold-carrier frame provided with wheels or trucks that run on said guide-tracks and rest upon said yielding sections while the mold-carrier is in position for condensing the cake, substantially as set forth.

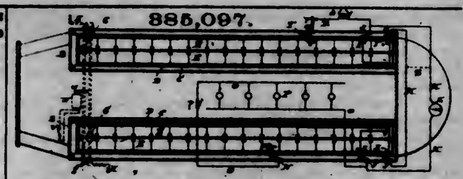
385,095. LIGHTNING-ESCAPE FOR WIRE FENCES. ALLEN CRAMMELL, Lamar, Mo. Filed Oct. 21, 1887. Serial No. 252,573. (No model.)

Claim.—1. In a fence adapted to carry off the electricity directly into the ground at the portion struck by lightning, a section of wire fence constructed with a single strand of wire extending between posts to which it is secured, and having its terminals grounded, substantially as shown and described.



2. A wire fence adapted to carry off the electricity directly into the ground at the portion struck by lightning, constructed of a number of sections, each section consisting of a strand of wire extending backward and forward between posts, secured to the latter on the side of the posts opposite to that on which the strand of the adjacent section is secured, and having its terminals grounded, substantially as described.

385,096. METHOD OF MAKING COATS. WOLF COHEN, New York, N. Y. Filed Mar. 2, 1888. Serial No. 265,892. (No model.)



Claim.—The method herein described of making coats, which consists in placing the complete outer fabric of the coat-body face to face with the complete lining therefor, turning the sleeves of both outer body and lining inside out, uniting the outer fabric to the lining, edge to edge, by a seam traversing their entire circumference, with the exception of the small opening, and the extremities of the sleeves to the extremities of the sleeve-linings, then turning the entire garment through said opening, substantially as specified.

385,097. ELECTRIC RAILWAY. G. HERMANN CRESSY, Philadelphia, Pa., assignor to the Electric Car Company of America, of Pennsylvania. Filed Jan. 16, 1888. Serial No. 260,925. (No model.)

385,097.

Claim.—1. A car having a guideway for a secondary battery slide or floor, in combination with a movable battery slide or floor upon which the batteries are arranged, and a mechanical power mechanism to move said battery slide or floor into or out of the car and upon its guideway.

2. A car having a guideway or support for a secondary battery slide or floor, in combination with a movable battery slide or floor upon which the batteries are arranged, provided with a rack, a pinion on the car to mesh with the rack of the slide, and suitable means to rotate said pinion.

3. A car having a guideway or support for a secondary battery slide or floor, in combination with a movable battery slide or floor upon which the batteries are arranged, provided with a rack, a pinion on the car to mesh with the rack of the slide, and a shaft carrying said pinion and extending to both sides of the car, whereby power may be applied at both ends.

4. A car having a guideway or support for a secondary battery slide or floor, in combination with a movable battery slide or floor upon which the batteries are arranged, provided with a rack, a pinion on the car to mesh with the rack of the slide, an electric motor to rotate said pinion, a motor-circuit, and a switch to control the motor.

5. In a car, the combination of guides upon which the battery floor or slide moves and rests, a battery floor or slide having a flat under surface, and a rack set in flush with said under surface, and a pinion on the car to mesh with said rack and move the battery floor or slide over the guides.

6. In a car, the combination of cylindrical drums or rollers upon which the battery floor or slide moves and rests, a battery floor or slide having a flat under surface, and a rack set in flush with said under surface, and a pinion on the car to mesh with said rack and move the battery floor or slide over the guides.

7. The combination of a car having two parallel sills and a battery-support between them and below their upper edges, with a removable battery-supporting slide or floor fitting between said sills and upon said support and having projecting sides extending above said sills for holding the battery-cells in place, and battery-cells supported upon the slide or floor and between the raised sides.

8. The combination of a car having two parallel sills and a battery-slide support between them and below their upper edges, with a battery slide or floor having raised sides and center, in which the sides extend part way down on the slide or floor, forming offsets for the car-sills, and two parallel rows of removable battery-cells arranged upon said slide or floor and respectively between the said raised sides and center.

9. A car-body having a guideway or support for a battery slide or floor and provided with three stationary contacts and an electric motor on the car, in combination with a motor-circuit in connection with two of said contacts, a lighting-circuit in the car in connection with the remaining contact and one of the motor-contacts, a removable battery slide or floor having three contacts corresponding to the three stationary contacts and adapted to make electrical connection with them when put in place on the car-body, and a battery of a large number of cells supported on said slide or floor and having all of its cells connected to the motor-contacts and a portion only of its cells connected to the lighting-circuit contacts.

10. A car-body having a guideway or support for a battery slide or floor and provided with three stationary contacts and an electric motor on the car, in combination with a motor-circuit in connection with two of said contacts, a lighting-circuit on the car in connection with the remaining contact and one of the motor-contacts, a removable battery slide or floor having three contacts corresponding to the three stationary contacts and adapted to make electrical connection with them when put in place on the car-body, a battery of a large number of cells supported on said slide or floor and having all of its cells connected to the motor-contacts, a portion only of its cells connected to the lighting-circuit contacts, and an independent switch to make or break said electric-light circuit.

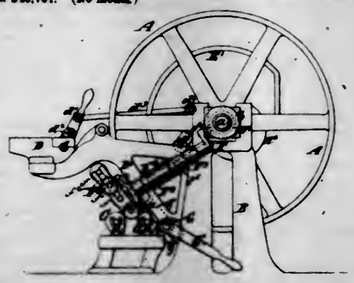
11. A car-body having a guideway or support for a battery slide or floor and provided with three stationary contacts and an electric motor on the car, in combination with a motor-circuit in connection with two of said contacts, an electric-signal circuit on the car in connection with the remaining contact and one of the motor-contacts, an electric signal in said circuit, a removable battery slide or floor having three contacts corresponding to the three stationary contacts and

adapted to make electrical connection with them when put in place on the car-body, and a battery of a large number of cells supported on said slide or floor and having all of its cells connected to the motor-contacts and a small portion only of its cells connected to the signal-circuit contacts.

12. A car-body having a guideway or support for a battery slide or floor and provided with three stationary contacts and an electric motor on the car, in combination with a motor-circuit in connection with two of said contacts, an electric signal-circuit on the car in connection with the remaining contact and one of the motor-contacts, an electric signal in said circuit, a removable battery slide or floor having three contacts corresponding to the three stationary contacts and adapted to make electrical connection with them when put in place on the car-body, and a battery of a large number of cells supported on said slide or floor and having all of its cells connected to the motor-contacts, a small portion only of its cells connected to the signal-circuit contacts, and an independent switch to interrupt the signal-circuit without affecting the continuity of the motor-circuit.

13. A car-body, in combination with two sets of stationary contacts, an electric circuit connecting one of each of said sets of stationary contacts, a switch or regulator for controlling the motor, electric circuits from the other two stationary contacts connecting with the switch or regulator, two removable floors or battery-supports each having two contacts which make electrical connection with the stationary contacts when the floors or supports are put in place, and a battery supported on each floor and electrically connected with the contacts thereof, whereby the two batteries are connected in series with each other.

14. A car-body, in combination with two sets of stationary contacts, an electric circuit connecting one of each of said sets of stationary contacts, a switch or regulator for controlling the motor, electric circuits from the other two stationary contacts connecting with the switch or regulator, two removable floors or battery-supports each having two contacts which make electrical connection with the stationary contacts when the floors or supports are put in place, and a battery consisting of a number of cells permanently connected in series, supported on each floor, and electrically connected with the contacts thereof, whereby the cells of the two batteries are connected in series with each other and with the regulator.



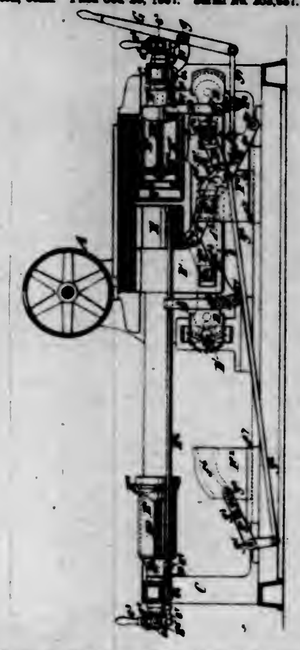
15. The combination of the car-body, an electric-lighting circuit on said car-body, a removable slide or floor, a large number of battery-cells supported by said floor and connected in series, an electric motor-circuit on the car, contact devices controlled by the slide or floor for automatically coupling all of the cells in series with the motor-circuit, and additional contact devices, also controlled by the slide or floor, for coupling a small portion of said cells in circuit with the lighting-circuit upon placing said floor or slide into position on the car-body.

16. A battery slide or floor for a vehicle, consisting of the body part D, having the recess *f* on the bottom, in which is set the rack F, and the raised sides *d* at the top.

17. A battery slide or floor for a vehicle, consisting of the body part D, having the recess *f* on the bottom, in which is set the rack F, and the raised sides *d* at the top, and the central strip, *e*, to keep the two rows of cells separated.

385,098. INKING APPARATUS FOR PRINTING-MACHINES.

CALVERT B. COTTRELL, Stonington, Conn. Filed Aug. 12, 1887. Serial No. 246,761. (No model.)



Claim.—1. The combination, with the cylinder and form-rollers for acting upon the form, of a movable frame or stand-top wherein are journaled the vibrating and other distributing rollers, a cam and rock-shaft for vibrating said rollers, and a bearing for the rock-shaft secured to the movable frame and serving to maintain the rock-shaft in engagement with its operating-cam, substantially as herein described.

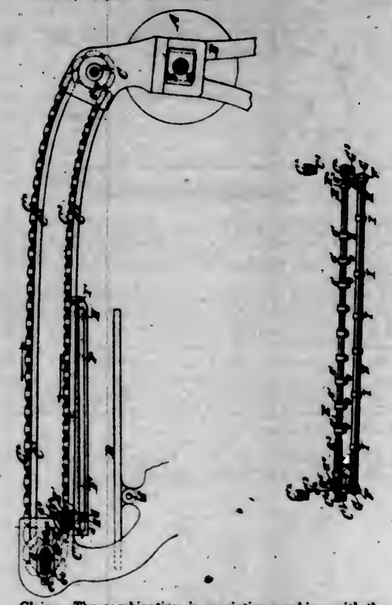
2. The combination, with the cylinder A and the form-rollers C, of the swinging frame F', carrying the distributing-rollers *f*, the eccentrics *g*, for moving said frame, the cam F', and the rock-shaft F, for vibrating certain of the rollers *f*, and the box F⁸ for said rock-shaft, secured to the swinging frame, substantially as herein described.

385,099. PRINTING-MACHINE.

CALVERT B. COTTRELL, Stonington, Conn. Filed Oct. 29, 1887. Serial No. 253,687. (No model.)

Claim.—1. The combination, with the bed of a cylinder printing-machine and a rack-and-pinion gearing for operating the bed, the rack of the gearing being hung from the bed to provide for a slight lengthwise movement of one relative to the other, of springs or cushions to arrest the movement of the bed without shock, mechanism, substantially as described, for regulating or varying the resistance which the springs or cushions oppose to the movement of the bed, and tappets which are carried by the bed and are shifted by the movement of the bed and rack, one relatively to the other, to operate through the said mechanism for varying the resistance offered by the springs or cushions, substantially as herein set forth.

2. The combination, with the bed of a printing-machine and a rack-and-pinion gearing for reciprocating it, the rack of said gearing sliding in the hanger on the bed and connected with said hanger by swinging links to provide for a slight sliding movement of the rack and bed, one relatively to the other, of toggle-levers having a pivotal point fixed on the rack and other pivotal points upon blocks having a limited sliding movement in the hanger, whereby when the toggle-levers are straightened the bed and rack are locked against sliding movement, one relatively to the other, a cam at one or each end of the machine with which a truck-roll on the toggle-levers engages to break up or deflect the toggle-levers, air springs or cushions for arresting the movement of the bed, and mechanism, substantially as described, for varying the resistance offered by the air springs or cushions, substantially as set forth.

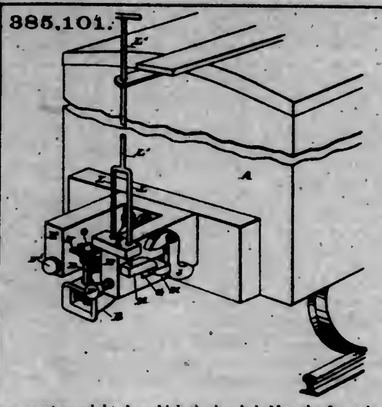


3. The combination, with the bed of a printing-machine and a rack-and-pinion gearing for reciprocating it, the rack of the gearing sliding in the hanger on the bed and connected therewith to have a slight sliding movement between the rack and bed, one relatively to the other, of toggle-levers having a pivotal point fixed on the rack and other pivotal points on blocks having a limited sliding movement in the hanger, whereby when the levers are straightened the bed and rack are locked against sliding movement, one relatively to the other, a sliding cam at one or each end of the machine with which a truck-roll on the toggle-levers engages to break up or deflect the toggle-levers, a hand-lever and connections for sliding said cam into and out of operative position, air springs or cushions for arresting the movement of the bed, and mechanism, substantially as described, whereby

the resistance offered by the air springs or cushions may be varied, substantially as herein set forth.

4. The combination, with the bed of a printing-machine, air springs or cushions for arresting its movement in opposite directions, and mechanism, substantially as described, for varying the resistance offered by the air springs or cushions, the mechanism at opposite ends of the machine being connected by a rod, as F⁹, of the rack-and-pinion gearing for operating the bed, including a rack having a slight sliding movement between it and the bed-hanger, toggle-levers, as described, whereby the rack and bed may be locked to prevent such sliding movement, arms D⁸ D⁸, which are connected with the bed-hanger and rack so as to be operated one by the bed running ahead of the rack and the other by the rack running ahead of the bed, and which operate on the rod E⁸ to vary both air springs or cushions, and cams at opposite ends of the machine for breaking up or deflecting the toggle-levers, substantially as herein set forth.

385,100. SHEET-DELIVERY APPARATUS FOR PRINTING-MACHINES.

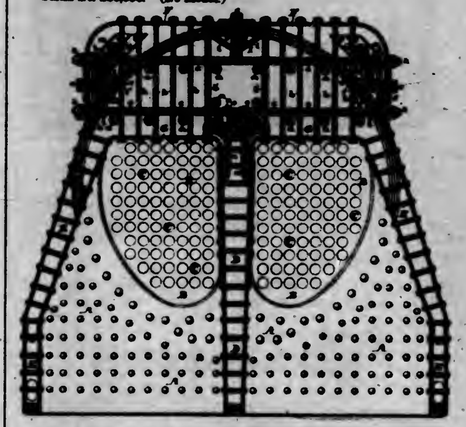


CALVERT B. COTTRELL, Stonington, Conn. Filed Oct. 31, 1887. Serial No. 253,894. (No model.)

Claim.—The combination, in a printing-machine, with the cylinder, a receiving-table at the farther end of the machine, and guides extending between them, of an endless delivery gripper-carrier traversing said guides, a spring-roller and tapes extending therefrom and secured to a bar extending between the guides, guides for the said roller, and a tappet-connection between the gripper-carrier and spring-roller, whereby soon after leaving the cylinder the gripper-carrier will take up and move forward the spring-roller under the sheet, and when released by the carrier the spring-roller will roll back and wind up the tapes, substantially as herein described.

385,101. CAR-COUPLING.

WILLIAM M. OTTER, Marysville, Cal. Filed Apr. 2, 1888. Serial No. 269,339. (No model.)



Claim.—1. The back wardly-sliding bumper and the transverse bar connected therewith, a spring or counter-weight by which said bar is forced to the front, in combination with the vertically-moving blocks and the pin-holding link connected therewith, said blocks being supported by a transverse bar, so as to hold the pin above the slot of the draw-head, and released by the impact of the bumper, substantially as herein described.

2. The back wardly-moving bumper, the transverse bar connected with and carried thereby, and the spring and counter-weights by which it is held to the front, in combination with the blocks holding the link, having their rear ends beveled or inclined to correspond with the beveled or inclined front edge of the transverse bar, so that the blocks may force the bar back ward and pass it when rising and be held up by it after they are raised, substantially as herein described.

3. The horizontally-sliding bumper and transverse bar, the spring or counter-weights by which the bar is held to the front, in combination with the vertically-moving lifting-rod, the block secured to its lower end, and the pin-holding link projecting from the inner block and swiveled so as to turn loosely in a horizontal plane, substantially as described.

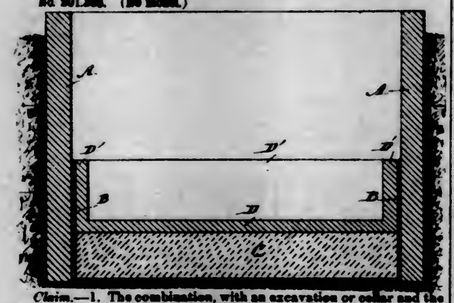
385,102. BOILER.

FRANCIS W. DEAN, Cambridge, Mass., assignor of one-half to Brunson D. Leavitt, Jr., same place. Filed Apr. 7, 1888. Serial No. 269,966. (No model.)

Claim.—1. In a boiler, the combination of two tie-rods, a bar connecting each end of one of said tie-rods with the same end of the other tie-rod, a bolt passing through said bar and the shell of the boiler, and nuts for clamping said shell and bar together.

2. In a boiler, the combination of two tie-rods the threaded ends of which project through the shell, nuts mounted upon the ends of said rods outside of said shell, a bar connecting each end of one of said tie-rods with the same end of the other, nuts mounted upon said tie-rods and bearing upon said bars to secure them to the shell of the boiler, and means for securing said connecting-bar to the shell of the boiler at a point midway between said tie-rods.

3. In a boiler, the combination of two tie-rods the ends of which are secured to opposite walls of the shell, a bar extending from either end of one of said tie-rods to the same end of the other tie-rod and provided with a hub at right angles to said shell, a bolt passing through said shell and hub, and nuts for clamping said shell and the hub of said bar together.



4. In a boiler, the combination of two stay-bolts secured at their upper ends to the shell of the boiler and at their lower ends to the crown-sheets, a bar extending from one bolt to the other at their upper ends, means for securing said bar to said shell midway between said bolts, a similar bar extending from one bolt to the other at their lower ends, and means for securing said lower bar to the walls of the water-leg.

5. The herein-described system of bracing the shell of a steam-chamber of a boiler, consisting of a series of transverse tie-rods, a

series of bars connecting said rods in pairs, means for securing said bars to the shell midway between said rods, a series of vertical stay-bolts connecting said shell to the crown-sheet, a bar extending from the upper end of one to the upper end of another of said stay-bolts, which are further apart than the others, means for securing said bar to the shell of the boiler midway between said stay-bolts, a similar bar extending from the lower end of one to the lower end of the other of said stay-bolts, and means for securing said last-mentioned bar to the water-leg or the crown-sheet, all constructed and arranged so that a man-passage is left between the various rods and bolts for the entire length of the steam-chamber.

6. A system of bracing the shell of a steam-boiler, consisting of a series of transverse tie-rods, a series of bars, each of which connect the ends of two of said tie-rods, bolts passing through said bars and the shell of the boiler, nuts mounted upon the threaded ends of said bolts for clamping said bars to said shell, and a series of vertical stay-bolts connecting said shell to the crown-sheet, all constructed and arranged so that a man-passage is left between the various rods and bolts for the entire length of the steam-chamber.

385,103. RENDERING CELLARS WATER-PROOF. FRANK J DE BOSSET, Babylon, assignor of one-half to Timothy P. Neville, New York, and Samuel Horan, Babylon, N. Y. Filed May 6, 1886. Serial No. 201,393. (No model.)

Claim.—1. The combination, with an excavation or cellar and the walls, A, of masonry, of a water-tight metallic casing, B, formed with a continuous bottom and vertical walls which fit against the walls of masonry, substantially as described.

2. The water-tight metallic casing B, fitted at the bottom of the excavation and against the walls, A, of masonry, in combination with the bed, C, of gravel, and the floor D and vertical walls D', built upon the bed C, substantially as described.

385,104. PUMP ATTACHMENT. THOMAS DUFFLEY, Rosemount, Minn. Filed Feb. 22, 1888. Serial No. 264,902. (No model.)

Claim.—A pump attachment for pump-tubes, consisting of plate 5, secured to tube 1 by metal band 7 and nuts 8, vent-tube 3, fastened in plate 5 and tube 1, valve 12, having groove 26, mounted in vent-tube 3, and formed with flange 22, and arm 11, with guide-pin 24, located in slotted projection 10, coiled spring 23, connecting-rod 16, pivoted lever 17, having lip 19, and frame 21, with rack 20 on well-curb 2, substantially as described

385,105. PROCESS OF MAKING RESIN-SOAP AND GLYCERINE. ALBERT DEMMER and OTTO C. HASSMANN, London, England, assignors to said Demmer and Joseph Gluck, Brooklyn, N. Y. Filed Sept. 14, 1887. Serial No. 249,694. (No specimens.)

Claim.—1. The process of preparing resin-soap from spent lye containing carbonated alkali, which consists in first adding lime to said lye and converting the carbonated alkali it contained into caustic alkali, in then allowing the lime to settle, drawing off the lye and concentrating it, and then adding resin sufficient to combine with said caustic alkali, as set forth.

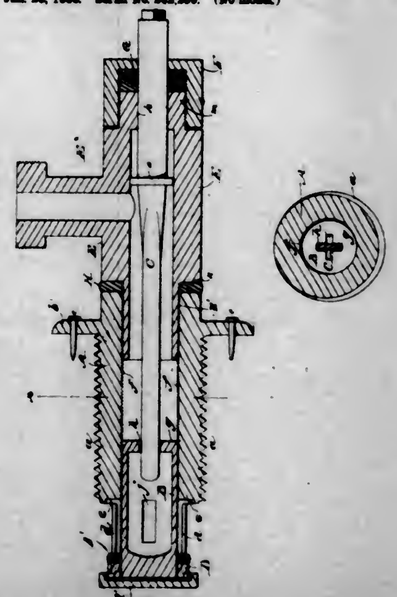
2. The process herein described of converting lye containing alkali into resin-soap and glycerine, which consists in adding to the lye lime, then resin, then settling the lye to separate the resin-soap, then adding acid in the presence of a mechanical carrier of the resulting precipitate, (of the nature of an insoluble powder,) then soda, then finally boiling down the lye until the salt it contains crystallizes and glycerine is formed, as set forth

385,106. IDENTIFYING DEVICE. EDWIN P. PIERCE, Auburn, N. Y., assignor of one-half to Cyrenus Wheeler, Jr., same place. Filed Mar. 16, 1888. Serial No. 267,662. (No model.)

Claim.—1. An identifying device consisting of a refractory case having a detachable cover and adapted to be carried upon the person, and containing a refractory tablet bearing marks of identification, substantially as described.

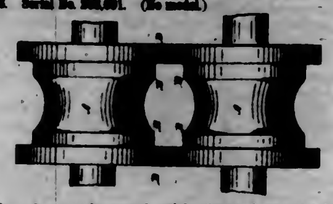
2. An identifying device consisting of a metallic case having a cover, both lined with refractory material, and a metallic tablet contained in said case and bearing marks of identification, substantially as described.

385,107. RAILWAY-SPIKE. JAMES S. FOX, Detroit, Mich. Filed Nov. 16, 1887. Serial No. 255,318. (No model.)



Claim.—1. A railway-spike triangular in cross-section and hollowed out at the back, and having a portion swelled or bulged beyond the general surface of its back immediately below the head, substantially as described.

2. A railway-spike triangular in cross-section, said spike hollowed out at the back only, said hollow terminating a short distance below the neck in a gradually-inclined surface, a^2, whereby the top of the spike is crowded toward the rail, substantially as described.



3. The herein-described railway-spike, constructed with a shaft triangular in cross-section and hollowed out at the back, a sloping surface, a^2, at the upper extremity of said hollow, and a portion swelled or bulged beyond the general surface of the back of the spike, as at a^3, substantially as described.

385,108. FAUCET. EDWIN P. J. FREEMAN, Roslyn, N. Y. Filed Jan. 28, 1888. Serial No. 262,220. (No model.)

Claim.—The cap A, externally and internally screw-threaded and formed with the guard or cap A' and separated plates *d*, in combination with the externally-screw-threaded plug B, having flanged cap-nut D, packing D', and openings *j* A, and the faucet E, rod or blade C, packing H, cap-nut F, and packing G, substantially as described.

385,109. TUBE AND MODE OF MAKING THE SAME. DAVID A. GARVER and CLARENCE H. STRAUSS, Bryan, Ohio. Filed Mar. 27, 1888. Serial No. 268,691. (No model.)

Claim.—1. As an improved article of manufacture, a tube having the laterally-projecting flanges or wings, both surfaces of the ends of which are substantially straight, as set forth.

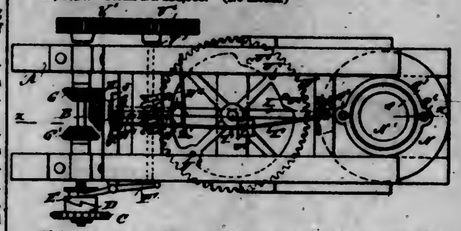
2. As an improved article of manufacture, a tube having the laterally-projecting flanges or wings, the ends of said flanges or wings being relatively thicker than the other portions of the tube, substantially as described.

3. As an improved article of manufacture, a tube having the laterally-projecting flanges or wings, the ends of said flanges or wings being relatively thicker than the other portions of the tube, both surfaces of said thicker portions being substantially straight, as set forth.

4. The herein-described process of forming flanged metal tubes, consisting in compressing a cylindrical blank between suitable dies and causing the intermediate or unconfined portions of said blank to bulge outward, substantially as described.

5. The herein-described process of forming metal tubes with flanges having thickened ends, consisting in compressing a cylindrical blank between suitable dies, allowing the unconfined portion of the blank to bulge outward, limiting the extent of such outward bulge, and subjecting the sides of said bulged portion to pressure, substantially as described.

385,110. CASH AND PACKAGE CARRIER. WILLIAM T. GRIER, Mansfield, Ohio. Filed Mar. 1, 1888. Serial No. 265,794. (No model.)



Claim.—1. In a cash and package carrier, the combination, with a suitable support, of a tilting guide pivoted thereon, a holder mounted on said guide and adapted to shift up and down upon the same, a track secured at one end to said holder, and a suitable support at the other end of said track, substantially as set forth.

2. In a cash and package carrier, the combination, with a suitable support, of a tilting guide pivoted thereon, a holder mounted by means of a roller on said guide and adapted to shift up and down upon the same, a track secured at one end to said holder, and a suitable support for the other end of the track, substantially as set forth.

3. In a cash and package carrier apparatus, the combination of a hanger provided with a tilting loop, E, having a guide, E', a yoke, J, provided with a roller mounted on said track, and a track, H, secured at one end to the cashier's desk and at the other end to the yoke J, substantially as described.

4. The combination of the hanger A, having the bracket B, the pivot-plate C, the loop E, the spring D, the yoke J, having the roller C, and the track H, arranged as described, and for the purpose specified.

385,111. DRILL. JOHN C. GOSNEY, Boyne City, Tex. Filed Nov. 11, 1887. Serial No. 255,263. (No model.)

Claim.—1. In a drill, a centrally-apertured drill-operating disk provided with pins projecting parallel with its axis for engaging the drill and directly rotating it, substantially as set forth.

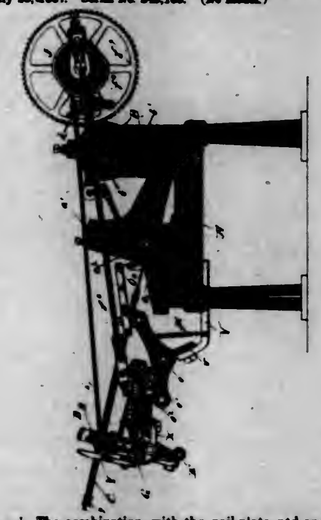
2. In a drill, a centrally-apertured drill-operating disk provided with pins projecting parallel with its axis, in combination with a drill clamp or collar having apertures through which said pins freely pass, substantially as set forth.

3. In a drill, a disk having a forward and backward motion and provided with a central aperture, through which passes a drill-tool, in combination with pins secured to said disk and a clamp fastened to the drill-tool and having apertures through which pass said pins, so that the drill-tool can be moved freely up and down, but is turned forward and backward by the said disk, substantially as shown and described.

4. In a drill, a disk provided with pins and engaging a clamp secured to the drilling-tool, in combination with a gear-wheel formed on said disk, a pinion meshing into said gear-wheel, a shaft carrying said pinion, and a second pinion fastened on the said shaft and engaging alternately gear-wheels on its sides, so as to rotate said shaft in opposite directions, substantially as shown and described.

5. In a drill, the combination, with the main shaft carrying two bevel gear-wheels, of a shaft carrying a bevel gear-wheel adapted to be connected alternately with the two bevel gear-wheels on said main shaft, a pinion secured on the said shaft, and a disk provided with a bevel gear-wheel meshing in the said pinion, said disk being connected with the drilling-tool, so that the latter can move freely up and down, but is turned by the said disk, substantially as shown and described.

6. In a drill, the combination, with a main shaft carrying two bevel gear-wheels, of a shaft carrying a bevel gear-wheel held between said two bevel gear-wheels on the main shaft, a box adapted to slide and in which said shaft is mounted, a lever pivotally connected with said box, a spring-bar connected with said lever, and a block held to slide on said spring-bar and having a rotary motion, substantially as shown and described.



7. In a drill, the combination, with a main shaft carrying two bevel gear-wheels, of a shaft carrying a bevel gear-wheel adapted to be engaged alternately by the said bevel gear-wheels on the main shaft, a sliding box in which the said shaft is mounted, a lever pivotally connected with said box, a spring-bar connected with said lever, a block sliding on said spring-bar, and a worm-wheel receiving its rotary motion from the main shaft and carrying a pin engaging said block, substantially as shown and described.

8. In a drill, the combination, with a main shaft carrying two bevel gear-wheels, of a shaft carrying a bevel gear-wheel adapted to be engaged alternately by said bevel gear-wheels on the main shaft, a sliding box in which said shaft is mounted, a lever pivotally connected with said box, a spring-bar connected with said lever, a block sliding on said spring-bar, and a worm-wheel receiving its rotary motion from the main shaft and carrying a pin engaging said block, and a bar for locking said lever in position, substantially as shown and described.

9. In a drill, the combination, with a main shaft carrying two

bevel gear-wheels, of a shaft provided with a bevel gear-wheel adapted to engage alternately said bevel gear-wheels on the main shaft, a box adapted to slide and in which said shaft is mounted, a lever pivotally connected with said box, a spring-bar connected with said lever, a block adapted to slide on said spring-bar, a worm-wheel carrying a pin engaging said sliding block, said worm-wheel being operated from the main shaft, pins held on said worm-wheel, a block having inclines and engaged by said pins, and a bar connected with said block and adapted to lock said lever in position, substantially as shown and described.

385,112. NAIL-PLATE FEEDER. JOHN C. GOULD, Chicago, Ill. Filed July 25, 1887. Serial No. 245,183. (No model.)

Claim.—1. The combination, with the nail-plate rod and with the knives of the nail-machine, of feeding-grippers reciprocating simultaneously in opposite directions and adapted to reverse the rod, substantially as set forth.

2. The combination, with the nail-plate rod and the cutting-knives, of grippers D, reciprocating simultaneously in opposite directions and adapted to reverse the rod, and a rocking lever or its equivalent for actuating said grippers, substantially as set forth.

3. The combination, with the nail-plate rod and the cutting-knives, of grippers D, reciprocating simultaneously in opposite directions to reverse said rod, and also oscillating to feed said rod, a rocking lever or its equivalent, imparting the reciprocation, and an oscillating support for said lever imparting the oscillation, substantially as set forth.

4. In a nail-plate feeder, the combination, with the nail-plate rod, of oppositely-reciprocating simultaneously-acting grippers adapted to reverse the rod, and arm g, or its equivalent, for operating said grippers and releasing the rod intermittently, substantially as set forth.

5. In a nail-plate feeder, the combination, with the nail-plate rod, of grippers reciprocating simultaneously in opposite directions to reverse the rod and oscillating to feed the plate, and an arm, g, or its equivalent, for intermittently separating such grippers to release the rod, substantially as set forth.

6. The nail-plate feeder wherein are combined grippers adapted to reverse the rod and to feed it and positioning-levers O and P, substantially as set forth.

7. In a nail-plate feeder, the combination of two opposing grippers yieldingly held together by a spring at their upper ends, as shown, and a rocking lever, E, in which said grippers are supported at their lower ends, and by which they are reciprocated, substantially as specified.

8. In a nail-plate feeder, the combination of grippers D with the pivoted inverted-T lever, in the extremities of which the grippers are supported, and a lever, F, for rocking the T-lever, substantially as set forth.

9. The combination of grippers D, the rocking T, and the plate H, the latter supporting the T and the T supporting the grippers, substantially as set forth.

10. The combination, with the oscillating grippers, of a cam and connections for causing such oscillation, the cam having the risers for acting upon the grippers while they have hold of the rod and causing them to withdraw the plate to clear the knife, substantially as specified.

11. The combination, with the oppositely-reciprocating grippers and their actuating-lever, of the cam J, mechanically connected to said grippers and having the risers for oscillating the grippers while they are reciprocating, substantially as specified.

12. The oscillating grippers for feeding the rod, in combination with their actuating-cam, when said cam is provided with risers n, and also adapted to actuate the grippers to withdraw the rod after each cut, substantially as specified.

13. The combination, with the grippers of a nail-plate feeder, of a cam, or its equivalent, for oscillating said grippers, acting to give them two backward oscillations, one while the rod is not held by them and one while it is held, substantially as specified.

14. In a nail-plate feeder, the combination, with the oscillating and oppositely-reciprocating grippers, of the positioning-levers O and P, substantially as specified.

15. In a nail-plate feeder, the combination, with the grippers and the rocking T and their supports, of the lever F, substantially as specified.

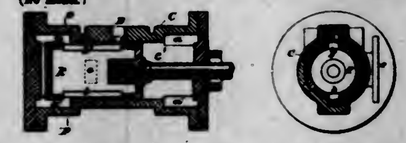
16. In a nail-plate feeder, the combination with the grippers and the rocking T and their supports, of the lever F and the plate W, by which all said parts are sustained, substantially as specified.

17. The combination, with the grippers, of the lever F, the separating-arm, and the ears upon said lever striking said arm and separating the grippers, substantially as specified.

18. The frame X, the plate H, pivotally supported in said frame, the grippers, and their actuating T, in combination with the cam and pitman for causing the oscillation of the grippers, substantially as specified.

19. In a nail-plate feeder wherein the plate is reversed and fed by grippers acting upon the rod, the combination, with such grippers, of positioning-levers controlling the point of the plate, such levers being pivoted or jointed so as to be capable of being turned out of the way to give access to the knives of the nail-machine, substantially as set forth.

20. In a nail-plate feeder the support W whereof is laterally adjustable, as set forth, the combination, with support W, of the sector and rack for moving the same in effecting the adjustment and the stationary plate v, upon which the support W is carried, substantially as set forth.



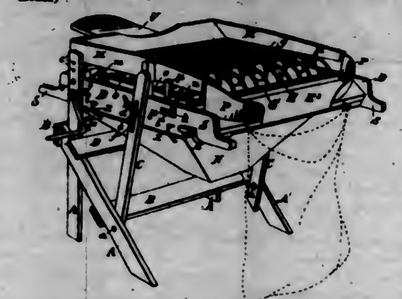
21. In a nail-plate feeder, and in combination with the plate feeding and turning grippers, the lever O, for positioning the plate, when said lever is provided with one or more adjustable joints, o^2, substantially as set forth.

22. The cam Q q, in combination with the lever actuated thereby, when said lever is provided with a set-screw, S, regulating its back-throw, and spring q', substantially as set forth.

23. The nail-plate feeder in which are combined the rod turning and feeding devices and a laterally-positioning lever, P, when the operating-point of said lever is secured to movable sleeve p^2, and is thus made adjustable to accommodate different widths of plates, substantially as set forth.

24. The nail-plate feeder the feeding-grippers whereof reciprocate simultaneously in opposite directions to reverse the plate, and also oscillate backward to withdraw the plate while it is being reversed, and are combined with a lever, or its equivalent, for imparting the reciprocation, and a cam, or its equivalent, for imparting the oscillation, substantially as set forth.

385,113. STEAM-ENGINE. JOHANN C. GRÄBNER, Kupferhammer, and HEINR. REPPERT, Braukwede, assignors to K. & Th. Möller, Kupferhammer, Prussia, Germany. Filed May 19, 1887. Serial No. 238,783. (No model.)

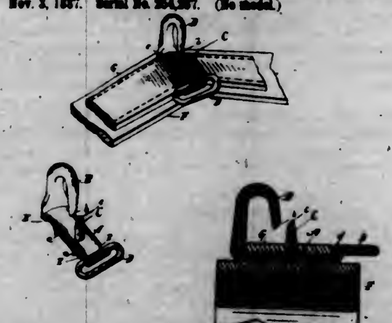


Claim.—1. The combination, with the cylinder C, having end grooves, a a', steam-inlet D between its ends, and an exhaust, of the hollow or tubular piston K, having closed ends and longitudinal openings b b', communicating with grooves a a' when the piston is at the extremes of its movement, the interior of the cylinder always communicating with the steam-inlet D, the exhaust being closed by the side walls of the piston until the ends of the piston pass thereby in both directions, substantially as set forth.

2. The combination, with the cylinder C, having end grooves, a a', steam-inlet D between the grooves, and an exhaust, c c', at opposite sides of the inlet D, of the hollow piston K, closed at its ends and having longitudinal openings b b', connecting the interior of the cylinder at all times with the inlet D, and connecting it with the grooves a a', respectively, at the extremes of its movement, both exhaust-ports being closed by the side wall of the piston and opened successively as the piston passes them in its two movements, substantially as set forth.

3. The combination, with the cylinder having end grooves and inlet- and exhaust ports, of the longitudinally-slitted spring-pistons having closing-pieces o, sealing-pieces g, and springs m, substantially as set forth.

385,114. POTATO SORTER OR GRADER. HENRY D. HERRINGTON, Tuxedo, N. Y. Filed June 25, 1887. Serial No. 242,457. (No model.)



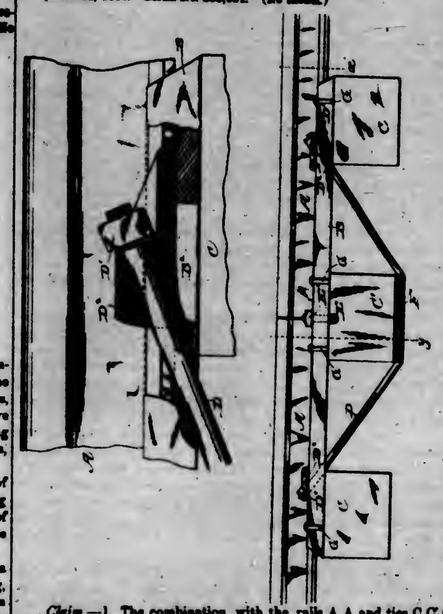
Claim.—1. In a potato-sorter, the combination of a grating composed of a series of parallel bars, endless chains running beneath the grating, a series of rods carried thereby transverse to the grate-bars, and the rollers carried on the transverse rods and projecting above the grate-bars, the rollers on any two successive transverse rods being alternately placed as regards the intervals between the grate-bars, substantially as and for the purpose described.

2. In a potato-sorter, the combination of a grating composed of a series of parallel rods laterally adjustable, endless chains running beneath the grating, the rods carried by said chains, and a series of laterally-adjustable rollers secured thereon and projecting above the grating, substantially as and for the purpose described.

3. In a potato-sorter, the combination of a grating formed of a series of parallel bars, the endless chains running beneath the grating, the transverse rods carried by said chain, and the rollers mounted on the transverse rods and capable of revolution thereon, substantially as and for the purpose specified.

4. The combination, with the rod p, having groove d' and holes d^2, of the spring-wire s and the roller H, substantially as described.

385,115. CHECK-REIN-HOOK. JOSEPH H. HILL, Chicago, Ill. Filed Nov. 3, 1887. Serial No. 254,227. (No model.)



Claim.—1. As an improved article of manufacture, a check-rein-hook for harness-pads, consisting of the base-plate A, the main hook B, formed on one end of the said base-plate, the auxiliary hook or spur C, formed upon the face of the base-plate in close proximity to the end of the hook B, the loop D, formed on the rear end of the base-plate and slightly raised above the same, forming the shoulder d, and the transverse ribs a, formed integral with the base-plate and extending entirely across the lower side thereof, the said base-plate being provided with the notches E in its edges, all arranged as and for the purposes described.

2. A check-rein-hook consisting of a base-plate, A, having formed in its opposite longitudinal edges the notches E, for the purpose described, and the main and auxiliary hooks formed integrally with the said base-plate, substantially as and for the purpose described.

3. A check-rein-hook consisting of the base-plate A, having formed integrally with it the main hook B, the back-strap loop D, formed on the rear end of the base-plate, and the ribs a, formed integrally with the said base-plate and extending entirely across its lower side, all substantially as described.

385,116. RAIL-JOINT. GEORGE H. HOSKINS, Nashua, N. H. Filed Nov. 21, 1887. Serial No. 255,661. (No model.)

Claim.—1. The combination, with the rails A A and ties C C C, of a plate, B, interposed between said ties and rails, and rods D, having their ends secured to said plate B and passing beneath the tie C, substantially as shown and described.

2. The combination, with the rails A A and ties C C C, of a channeled plate, B, interposed between said ties and rails, and rods D, having their ends secured to said plate B and passing beneath the joint-tie C, substantially as shown and described.

3. The combination, with the rails A A and ties C C C, of a plate, B, rods D, nuts D', and leveling-blocks D^2, substantially as shown and described.

4. The combination, with the rails A A and ties C C C, of a plate B, rods D, and U-bolt E, substantially as shown and described.

385,117. TOOTH-REGULATOR. WOODBURY S. HOW, Philadelphia, Pa., assignor to the S. S. White Dental Manufacturing Company, same place. Filed Feb. 13, 1888. Serial No. 263,672. (No model.)

Claim.—1. The clamp-yoke for dentists' use hereinbefore described, consisting of the bent-wire yoke, both members of which are screw-threaded, the rigid coupling-bar perforated for the passage of the screw-threaded ends of said yoke and provided with a rigid locking clip or finger to fit over the end of the tooth, and the independent clamp-nuts fitting said screw-threaded ends of said yoke, substantially as described, whereby said yoke may be inserted from the palatal side of the tooth by one movement with one leg or end of said yoke at each side of the neck of the tooth to which the yoke is to be clamped and be securely clamped in proper position upon the tooth without bending by the separate clamp-nuts and without interfering with adjacent teeth.

2. The clamp-yoke having a coupling-bar provided with a spring-lip to be compressed by a clamp-nut, substantially as described.

3. The clamp-yoke having a coupling-bar fitted with strengthening or locking ribs next the teeth, substantially as described.

4. The clamp-yoke having an anchoring button or lug at its inner curved portion, substantially as described.

385,118. SPRING BED OR MID-BOTTOM. FRANK M. JEFFERY, Jersey City, N. J. Filed Mar. 9, 1887. Serial No. 230,169. (No model.)

Claim.—1. A roll-up spring-bed consisting of spring supporting-slats, all permanently connected together, coil-springs mounted on said slats and connected together at their tops, and a continuous top frame mounted on the tops of the marginal springs all around, the end bars of said top frame consisting each of short sections hinged permanently together at and between all the rows of springs, the hinges being arranged to flex or fold successively in opposite directions, as set forth.

2. The hinging-plate D, having attaching-studs *d*, for riveting the plate to the slat, a bar, d', an inclined overhanging surface, $d^{\times}$, and a curved prong, d^{3}, in combination with the slat and the flat link, the latter having a hole in its end to engage the prong d^{3}, substantially as set forth.

3. The combination, with the slats arranged parallel and connected by hinged distancing-links, of the springs mounted thereon in the order shown and the end bars of the top frame made up of short sections hinged together at the alternate slats, and also between each row of springs, substantially as set forth.

4. The combination, with the slats arranged parallel of the coil-springs mounted thereon in the order shown, the jointed and hinged end bar of the top frame, supported on the coil-springs at the ends of the rows on alternate slats, the springs *l* on the intermediate slats, and the braces *k*, connecting said springs, respectively, with said jointed end bar and supporting same at the joints, said braces being hinged at their ends to said springs and end bar, as set forth.

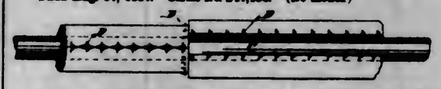
5. The combination, with the two adjacent slats of a spring bed-bottom to form a collapsing hinge, of the link $C^{\times}$, hinged at one end to one slat and at the other end to slide *c*, the said slide *c* mounted in a slideway on the other slat extending longitudinally thereof, and the short link $C^{\times\times}$, hinged to the slat having the slideway at its one end and to the link $C^{\times}$ at its other end, said hinges permitting the bed-bottom to be rolled up by the play of the links on their hinging-prongs, substantially as set forth.

6. The combination, with the slats $A^{\times}$ and $A^{\times\times}$ and the hinge-plates D, mounted on same, of the links $C^{\times}$ and $C^{\times\times}$, hinged to the curved prongs of said hinge-plates, respectively, and pivotally connected at *x*, and the slide *c*, mounted in a longitudinal slot, *c'*, in the slat $A^{\times\times}$, the link $C^{\times}$ being hinged to said slide *c*, substantially as set forth.

7. The combination, with two adjacent parallel slats of a spring bed-bottom, of collapsing hinges connecting the same, the springs mounted on said slats in alternating order, as shown, the eyes $b^{\times}$, mounted on the outer or non-adjacent sides of said springs, and a continuous flexible lacing-cord, *b'*, threaded through said eyes and extending in a zigzag manner over said springs, substantially as set forth.

8. The combination, with the slats and springs of a spring-bed, and the side bar, E, mounted on the marginal springs, of the brace *g*, hinged at its upper end to said bar and at its foot to the torsional spring-support A, and the said spring-support constructed and mounted on a slat, substantially as set forth.

9. The combination, with the slat, of the spring-support *l*, mounted on the slat and comprising the coils $l^{\times}$, and a long upwardly-projecting bail, the brace *k*, of flat metal, hinged at its lower end to the top of said bail and secured at its upper end to the sections $i^{\times}$ of the end bar of the top frame, and the hinged sections of which said end bar is composed, the said bail and said brace *k* forming an angle with each other, or knuckle, where they are connected, whereby, when the end bar is depressed in rolling up the bed, said bail will be pressed inward or from the margin of the bed.



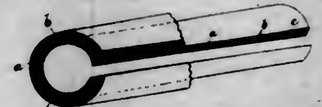
10. The combination, with the marginal springs at the ends of the bed-bottoms, of the sections *i*, secured to the tops of said springs, the sections $i^{\times}$, hinged to the ends of sections *i*, the short sections $i^{\times}$, hinged to the adjacent ends of sections $i^{\times}$, and the hinging-plates *j* and $j^{\times}$, said sections and hinges forming the end bar, $E^{\times}$, substantially as described.

11. The end bar, $E^{\times}$, constructed of sections $i\ i^{\times}\ i^{\times}$, hinged together in the manner set forth, and the hinge-plate *j* on one of said sections, $i^{\times}$, mounted in a slide-bearing, substantially as set forth.

12. The combination, with the slats arranged parallel, and the springs arranged in alternate order on adjacent slats, of the clips *c*, each having two eyes and secured rigidly to the top of the spring, as shown, and the stiff links *c'*, loosely linked to said clips *c* at their ends, and arranged in the following order, namely: a single zigzag row of independent links extending lengthwise of the slats between each row of springs, substantially as set forth.

13. The combination, with the side bar, E, and slats A of a spring-bed, of the main brace *g*, hinged at its upper end to the side bar and at its lower end to a torsion-spring support on the second slat, A, the said torsion-spring support A provided with a hinging bail, as shown, and the auxiliary brace $g^{\times}$, hinged at its one end to the brace *g* and at its other end to the marginal slat A, whereby the said braces *g* and $g^{\times}$ are arranged to stand substantially at right angles with each other normally.

385,119. PIPE-COVERING. HENRY W. JOHNS, New York, N. Y. Filed Aug. 17, 1887. Serial No. 247,132. (No model.)



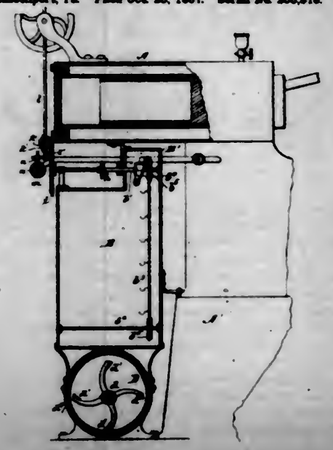
Claim.—1. The herein-described compound sheet, composed of loose fibrous asbestus and disintegrated sponge attached to the surface of an insulating-sheet, substantially as set forth.

2. As a new manufacture, the described boiler and pipe covering, composed of fibrous asbestus and disintegrated sponge attached to the surface of an insulating-sheet and made into cylindrical sections, substantially as set forth.

3. The described improvement in sectional pipe and boiler covering, consisting of hooks or buttons attached at or near the edges of the covering, adapted to engage with a cord, wire, or equivalent article, whereby the edges of the covering may be drawn together and the seam closed, substantially as set forth.

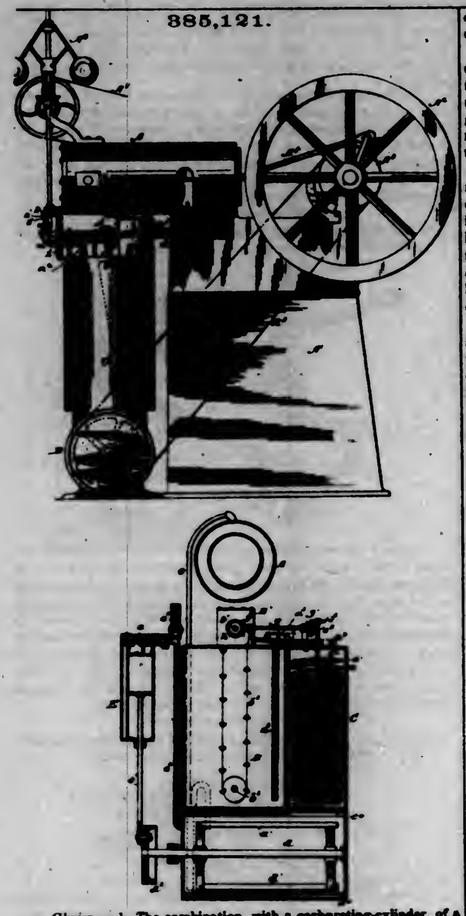
385,120. FILLING, LINING, AND COVERING MATERIAL. HENRY W. JOHNS, New York, N. Y. Filed Nov. 20, 1887. Serial No. 256,666. (No specimens.)

Claim.—1. The herein-described manufacture, composed of fibrous asbestus and fibrous or disintegrated sponge, substantially as set forth.



2. The herein-described manufacture, composed, essentially, of fibrous asbestus, fibrous or disintegrated sponge, and an adhesive substance, substantially as set forth.

3. The herein-described manufacture, composed, essentially, of fibrous asbestus, fibrous or disintegrated sponge, and an antiseptic or disinfecting substance, substantially as set forth.



4. The herein-described manufacture, composed, essentially, of fibrous asbestus and fibrous or disintegrated sponge, the sponge being treated with a fireproofing material, substantially as set forth.

5. The herein-described manufacture, composed, essentially, of fibrous asbestus and fibrous or disintegrated sponge, the sponge being treated with oil or like waterproofing material, substantially as set forth.

385,121. CARBURETOR. CHESTER S. KING and EDWARD G. BROWN, Smethport, Pa. Filed Oct. 20, 1887. Serial No. 253,313. (No model.)

385,121.

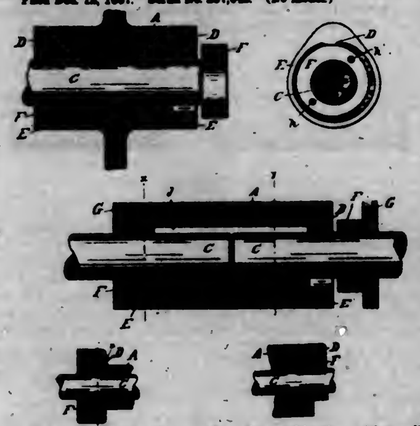
Claim.—1. The combination, with a carbureting-cylinder, of a cylinder arranged below and communicating with the carbureting-cylinder and provided with an agitater, substantially as and for the purpose set forth.

2. The combination, with a carbureting-cylinder having an open bottom, of a cylinder arranged below the carbureting-cylinder for receiving the heavier particles of hydrocarbon passing through the carbureting-cylinder, and an agitator in said cylinder, substantially as herein shown and described.

3. The combination, with a carbureting-cylinder, of a cylinder arranged below the carbureting-cylinder and communicating therewith and having a water-jacket surrounding it, and an agitator in the said jacketed cylinder, substantially as described, whereby provision is made for heating and breaking up the heavier particles of hydrocarbon passing through the carbureting-cylinder, as set forth.

4. The combination of a carbureting-cylinder, a cylinder arranged below and communicating with the carbureting-cylinder and having a water-jacket surrounding it, an agitater in the jacketed cylinder, and an air-forcing apparatus connected to the said jacketed cylinder, substantially as herein shown and described.

5. In a carburetor, the combination of a cylinder having an open bottom and provided with an inlet for the hydrocarbon and an exit for the carbureted air at the top, a series of concave and centrally-apertured plates secured within the cylinder, a shaft journaled in the cylinder, and a series of convex plates of less diameter than the cylinder and secured to the shaft between the concave plates, substantially as described.



6. The combination, with an engine-governor, of a hydrocarbon-reservoir, a carbureting-cylinder, an endless chain of buckets for supplying the hydrocarbon to the carbureting-cylinder, and intermediate mechanism between the buckets and governor-shaft, substantially as described, whereby provision is made for regulating the supply of hydrocarbon to the carbureting-cylinder from the governor, as set forth.

7. The combination, with an engine-governor, of a carbureting-cylinder, a shaft journaled therein, a hydrocarbon-reservoir, a feeder for supplying the hydrocarbon to the carbureting-cylinder, and intermediate mechanism between the feeder, the carburetor-shaft, and the governor, substantially as described, whereby provision is made for regulating the supply of hydrocarbon to the carbureting-cylinder and the operation of the carburetor from the governor, as set forth.

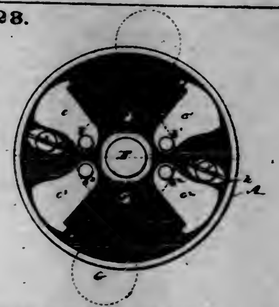
8. The combination, with an engine and its governor, of a carbureting-cylinder, a hydrocarbon-reservoir, a feeder for supplying hydrocarbon to the carbureting-cylinder, a shaft journaled in said carbureting-cylinder, a pipe for supplying carbureted air to the engine, a valve in the said pipe, and intermediate mechanism between the valve, the feeder, and the carburetor-shaft and the governor, substantially as described, whereby provision is made for regulating the supply of hydrocarbon to the carburetor, the supply of carbureted air to the engine, and for controlling the operation of the carburetor, as set forth.

9. The combination, with the water-jacket of an engine-cylinder and an agitator-cylinder having a water-jacket, of a pipe connecting the two water-spaces and having an extension projecting into the body of the agitator-cylinder for containing mercury, substantially as and the purpose set forth.

385,122. FRICTION-COUPLING. OTTO KRESSE, Sandusky, Ohio. Filed Dec. 13, 1887. Serial No. 257,642. (No model.)

Claim.—1. In a friction-coupling, the combination, with a collar or sleeve provided with a bore for the reception of a shaft, and an abutment on the end of said collar or sleeve, of a ring-wedge having a bore to fit the shaft, and an outer cylindrical face, or its described equivalent, eccentric therewith and adapted to operate in connection with the shaft and abutment on the collar or sleeve, substantially as and for the purpose described.

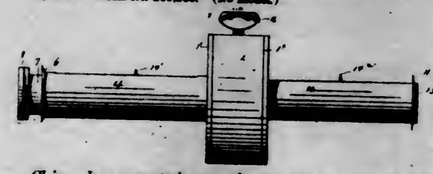
2. In a shaft-coupling, the combination, with a collar or sleeve provided with a central bore, and an annular flange formed upon the end of said collar or sleeve, and an abutment formed integral with said flange, of a ring-wedge having a corresponding bore with the sleeve and an outer face eccentric therewith, said ring-wedge being adapted to act in connection with the abutment and shaft, substantially as and for the purpose described.



3. In a friction-coupling, the combination, with a sleeve provided with a central bore, a keyway formed in said bore, an annular recess formed on the end of said sleeve eccentric thereto, and an abutment formed on the inner face of said recess, of a ring-wedge having a corresponding bore with the sleeve and adapted to fit into the recess, substantially as and for the purpose described.

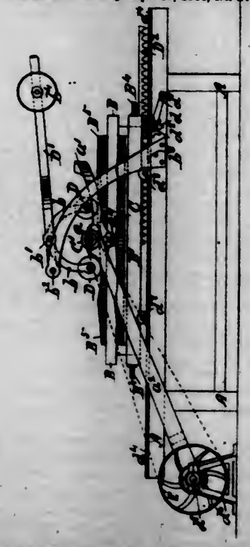
385,123. CLUTCH. REBA B. LAKE, Camden, N. J. Filed Apr. 19, 1887. Serial No. 235,307. (No model.)

Claim.—1. The combination, with a rotary shaft, of a double clutch consisting of and comprising a circular plate secured to said shaft, a cylindrical box within which said plate is arranged, eccentrically-pivoted levers attached to said plate on either side of said shaft, springs bearing upon said levers, and a rotary cap provided with keys which engage with said levers and cause the same to be released from engagement with the inner surface of the box, substantially as set forth.



2. The combination, with the rotary shaft F and plate D, rigidly attached thereto and movable therewith, and pivoted levers $c\ c'\ c^{2}$, whose outer ends coincide with the periphery of said plate when the

385,128.



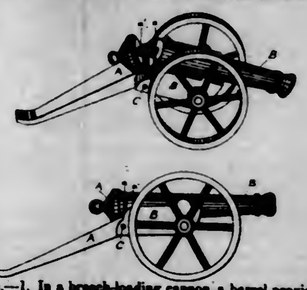
levers are separated a given distance and extend beyond said periphery when they are drawn together, of a releasing and controlling mechanism consisting of the top plate, B, provided with keys *h h'*, and handle G, whereby the initial movement of said handle and plate will separate the levers and allow the continued movement of the handle to rotate the shaft, substantially as shown and described.

385,124. CARPENTER'S GAGE. ARTHUR LAPORTE, Ware, assignor of one-half to J. A. Courtemanche, Worcester, Mass. Filed Apr. 2, 1888. Serial No. 269,265. (No model.)

Claim.—In a carpenter's gage, the combination, with the stock provided with a marking-disk at one end and a supplementary guide-plate at the other end, of the guide-block having a cylindrical shell carrying a marking-disk on its outer end, extending out from one face of said block, in which the stock telescopically slides, and a sliding bar provided with a marking-point at each end, extending in a groove in said stock, and a set-screw for clamping the several parts together, all constructed and arranged substantially as shown and described.

385,125. WOOD WORKING AND PLANING MACHINE. RILEY H. LEE, Chicago, Ill. Filed Nov. 19, 1887. Serial No. 255,865. (No model.) Patented in Norway Sept. 12, 1888, No. 270

Claim.—1. In a wood-working machine, the combination, with a reciprocating carriage consisting of the table B and the table-bed B', of the cutter-head C, the shaft *a*, on which said cutter-head is mounted, the yoke *a'*, the inclined side bars, a^2 a^3, the rock-shaft C^2, the stand C^3, and the guide-rollers a^4 a^5, journaled in the same frame with and below the cutter-head, substantially as and for the purpose set forth.



2. The combination, with the presser-rollers D D, of the curved arms *b b*, in which said rollers are journaled, the shaft *b'*, supporting said arms, the weighted lever D', having a fulcrum-bearing on the shaft *b'*, the bearing-pin b^2, with which the forked ends of said lever engage, and the supporting-standards b^3 b^3, whereby said rollers are adapted to conform to and follow the movements of the cutter-head, substantially as and for the purpose set forth.

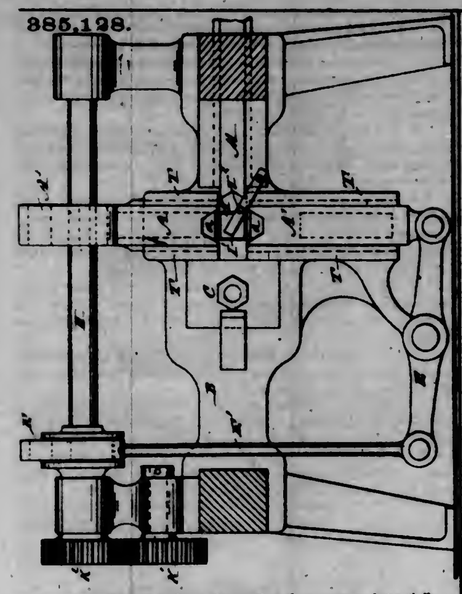
385,126. PUDDLE-RIDDER. WILLIAM LEHIGH, Catasauqua, Ill. Filed Sept. 20, 1887. Serial No. 251,002. (No model.)

Claim.—The combination of the base B, having the cross foot-cleats F and pins *a* on its upper face, twine-receptacle G, secured on the upper face of said base at one end, yoke E, secured longitudinally on the upper face of said base along one side thereof, so as to leave a space between it and said pins, curved arm D, pivotally secured to the outer side of said base, near one end thereof, and arranged to have its curve opposite the curved part of said yoke and operate in conjunction therewith, and ratchet-post C, secured to the outer side of said yoke, near the outer end of said curved arm, for engaging therewith, substantially as and for the purpose set forth.

385,127. FIRE-CRACKER CANNON. JOHN J. LOSS, Weymouth, Mass. Filed Feb. 20, 1888. Serial No. 264,630. (Model.)

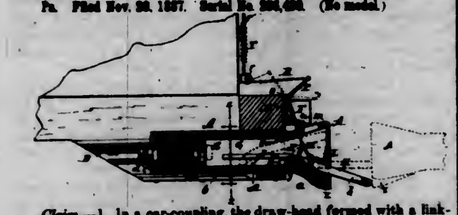
Claim.—1. In a breech-loading cannon, a barrel provided at the breech with a wide vent cut across the whole face of the end of the barrel or of the breech-block above the center, substantially as and for the purposes described.

2. In a breech-loading cannon, a barrel provided with the wide vent *a*, cut across the whole face of the end of the barrel, in combination with a breech-block provided with a boss, *a'*, substantially as and for the purposes described.



3. A breech-loading cannon provided with a split vent and consisting of a barrel rigidly secured to the carriage-cheeks, in combination with a breech-block hinged to said cheeks and a stock rigidly secured to said breech-block, whereby the stock may be folded between the wheels, thereby reducing the bulk, substantially as and for the purposes described.

385,128. NUT-MACHINE. ALFRED MARLAIS, Pittsburg, Pa. Filed Feb. 21, 1888. Serial No. 264,732. (No model.)



Claim.—1. The combination, with the cross-bar B, having the box B', of the swages A A', and means, substantially as described, for reciprocating one swage at a greater speed than the other, substantially as described.

2. The cross-bar B and the swages A A', having knives *a a*, in combination with means for reciprocating the swages, substantially as described.

385,128.

385,129. CAR-COUPLING. HENRY S. MCCAGUE, McSherrystown, Pa. Filed Nov. 30, 1887. Serial No. 256,696. (No model.)

Claim.—1. In a car-coupling, the draw-head formed with a link-socket, G, having a top opening, *m*, and provided at opposite sides with horizontal longitudinally-extending flanges I, and lugs K, forming ways J, and draft-shoulders *j*, substantially as set forth.

2. In a car-coupling, the draw-head formed with a link-socket having an opening, *m*, in its top, and provided on its inner sides with horizontal longitudinally-extending flanges I, and lugs K at the forward ends thereof, forming ways J, and draft-shoulders *j*, the horn L in its bottom, and the projection T on the outer face of the forward edge of the bottom, substantially as set forth.

3. In a car-coupling, the draw-head made with a link-socket, G, provided at opposite sides with flanges I and lugs K, forming ways J, draft-shoulders *j*, and said draw-head provided also with a horn, L, in combination with a coupling-link, H, formed with front link portion, *h*, a stem, *h'*, and a cross-bar, h^2, and said lugs K having inclined front faces, *k*, and the rearward-sliding link having corresponding inclined faces or shoulders, *i*, substantially as described, for the purposes set forth.

4. In a car-coupling, the draw-head made with a link-socket, G, provided at opposite sides with longitudinally-extending flanges I and lugs K, forming ways J, and draft-shoulders *j*, and said draw-head provided also with a horn, L, and an opening, *m*, in its top, in combination with a rearwardly-sliding coupling-link, H, formed with front link portions, *h*, a stem, *h'*, and a cross-bar, h^2, a rock-shaft, O, journaled on the car and provided with an arm, N, and a flexible connection, M, extending through the opening *m* and connecting said arm and the coupling-link, substantially as shown and described.

5. In a car-coupling, the combination of the draw-head, a coupling-link therein, a rock-shaft, O, journaled on the car and provided with an arm, N, a flexible connection, M, between the link and arm, an arm, P, on the shaft, a lever, S, fulcrumed at the top of the car and formed with axle *s*, and arms *s' s²*, and connections, as R *r'*, between the arm P and lever S, substantially as described, for the purposes set forth.

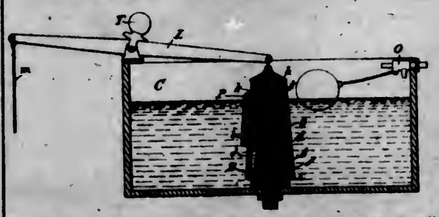
6. In a car-coupling, the combination, with the draw-head, a coupling-link therein, and a shaft, O, journaled on the car and provided with an arm, N, connected to the link, and an arm, O', on the shaft, of a foot-lever, U, fulcrumed on the car and having an arm, *u*, extending across the shaft-arm O', substantially as described, for the purpose set forth.

7. In a car-coupling, the combination, with the draw-head, a coupling-link therein, and a shaft, O, journaled on the car and provided with an arm, N, connected to the link, of a lever, V, pivoted loosely on the shaft, a spring, W, on the shaft, and connected at one end to the shaft and at the other end to the lever, and a detent, X, for said lever, substantially as described, for the purposes set forth.

8. In a car-coupling, the combination, with the draw-head, a coupling-link therein, and a shaft, O, journaled on the car and provided with an arm, N, connected to the link, of an arm, P, on the shaft, a lever, S, journaled at the top of the car, a connection between the parts P S, and a spring, T, interposed in said connection, substantially as described, for the purposes set forth.

9. The combination, with a draw-head provided with a rearwardly-sliding and vertically-swinging link, of an opposing draw-head provided with a lug on its lower face at the front thereof, to force the link inward and thereby raise it, substantially as set forth.

10. The combination, with a draw-head formed with a rearwardly-sliding and vertically-swinging link, a lever, and a flexible connection extending through the draw-head and engaging the link, of an opposing draw-head having an internal horn and a lug on its lower face at the front end thereof, to strike the link and force it inward and upward, whereby by then operating said lever the link may be shot forward into engagement with the horn of said opposing draw-head, substantially as set forth.



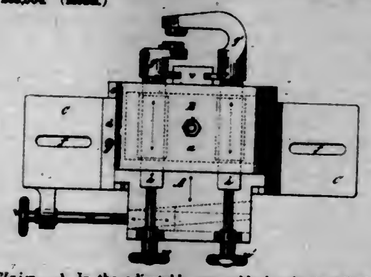
11. The combination, with the draw-head and its coupler, of a spring connected with said coupler and means for setting the spring to exert its force upon the said coupler, whereby when the draft strain is lessened the coupler will be disengaged from the opposing draw-head, substantially as set forth.

12. The combination, with the draw-head and its coupler, of an automatically-operating uncoupler comprising a rock-shaft connected with said coupler and spring connected with said shaft for rocking it and releasing the coupler, substantially as set forth.

13. The combination, with the draw-head and the coupling mechanism, of a spring-actuated uncoupling-shaft connected with said coupling mechanism, and a lever for setting said spring-actuated shaft, substantially as set forth.

14. An automatic uncoupler for cars, consisting in a rock-shaft having flexible connections for connecting it with a coupler, a torsion-spring secured at one end to the shaft, a lever loose upon the said shaft at the side of a car and connected to the opposite end of the spring for putting it under torsional strain, a second lever to be secured at the top of a car and connected to said rock-shaft, and a longitudinally expansible and contractible spring forming part of the connection between said top lever and the rock-shaft, whereby the rock-shaft may be set to be actuated by either spring, substantially as set forth.

385,130. WATER-CLOSET CISTERN. HARRISON S. MILLER, Indianapolis, Ind., assignor to Charles W. Heckel, same place. Filed Oct. 18, 1887. Serial No. 252,660. (No model.)

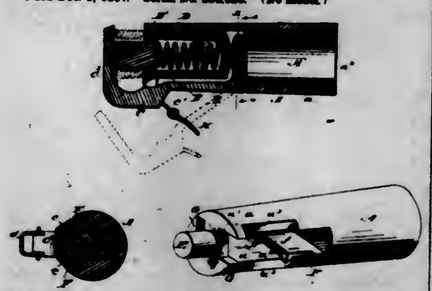


Claim.—1. In a water-closet cistern, the combination of the discharge-pipe arranged to project above the bottom of the cistern, the annular cup surrounding the base of said discharge-pipe, the mercury seal in said cup, and the tubular valve having double walls, the inner one of which enters at one end the annular cup and has openings at the other end communicating with the space between the walls, all arranged to co-operate substantially as and for the purpose specified.

2. In a water-closet cistern, the combination of the discharge-pipe arranged to project above the bottom of the cistern, the annular cup surrounding said discharge-pipe, the mercury seal in said cup, the tubular valve having double walls, the inner one of which enters at one end the annular cup and has openings at the other end communicating with the space between the walls, and the tube extending along the outer wall of the valve, open at both ends, and connecting the interior of the valve near its upper end with the exterior near its

lower end, all arranged to co-operate substantially as and for the purpose specified.

385,131. ADJUSTABLE SAW-GUIDE. DONALD J. MURRAY, Wausau, Wis. Filed Mar. 9, 1888. Renewed Feb. 9, 1888. Serial No. 263,804. (Model.)



Claim.—1. In the adjustable saw-guide herein described, the adjustively sliding and slid arm-carriage, furnished with the rigid box-frame, having the pair of dovetailing angle-slides cut into its basal ends, and the obliquely-cut slot under the front end of its carrier-plate, in combination with the carriage bed-plate furnished with the correspondingly-inclined and carriage-bearing slide-flanges, the end-adjusted bolt-slots, and the front-placed guide-trough, in which is geared the longitudinally-sliding, laterally-engaging, and regulatively-moving angle-block, all made to adjustably co-operate upon the husk-table of a saw-frame, substantially as and for the purposes herein specified.

2. In the arm-carriage of the saw-guide herein described, the combination, with the rigid box having shaft-bearing sides, the nut-bolted clamping-lid, and the crank-checking bracket-plate, of the pair of longitudinally-adjustable and laterally-turning tube-shafts, furnished each on its rear or saw end with a counterfacing crank-arm, and on its front end with a regulatively-turned screw-rod, each said cranked arm having an eccentrically-curved check-stop shoulder, and within a counterstapering socket a counterfacing bearing guide-pad, all made to regulatively co-operate upon each and both sides of a saw-rim, substantially as and for the purposes herein specified.

3. The combination, with the basal counterfacing angle-slides of the arm-carriage box, containing and clamping the independently-regulative tube-shaft and guide-pad gearing herein described, of the set-screwed clamping-plate intermedially held by the counter-faces of either set of dovetailing slides at each end of said carriage-box, and of the screw-geared angle-block of said bed-plate, the former having its obliquely-edged cap-plate regulatively engaging the correspondingly-oblique under slot of the latter, all substantially as and for the purposes herein specified.

385,132. HORSE-DETACHER. GEORGE T. PARKER, Glasgow, Ky. Filed Dec. 3, 1887. Serial No. 256,999. (No model.)

Claim.—1. The combination, with the ferrule having the trace-stud, of the double-armed stud whereby to force the trace off such stud, the retracting-spring operating between the arms of the slide, and a tripper, substantially as set forth.

2. The ferrule having a trace-stud, the slide whereby to force the trace off the stud, and the tripper having a crank-like arm arranged to engage the rear end of said slide, substantially as set forth.

3. In a horse-detacher, the combination, with the trace-securing stud, of the double-armed slide having arms movable along said stud on opposite sides thereof, substantially as set forth.

4. The improved horse-detacher herein described, consisting of the slide, the tripper, and the ferrule constructed to receive such slide and tripper, substantially as described, whereby such parts may be cast ready for use and be operatively connected without the intervention of connecting-rivets and the like, substantially as set forth.

5. A horse-detacher comprising a ferrule provided with a trace-securing stud and with a socket having its walls grooved, the slide and tripper, and lateral teats to enter the grooves of the socket-walls, substantially as set forth.

6. The ferrule having a socket the walls of which are provided with grooves F F', connected by grooves *f*, the slide, and the tripper having lateral teats to enter the grooves of the socket-walls, substantially as set forth.

7. The ferrule having a socket and formed with a bridge, *c'*, and ways G G, combined with the slide having its arms movable through such ways and having their rear ends connected by a cross-bar, the spring fitted in said slide and operating between its rear cross-bar and the bridge *c'*, and the tripper, substantially as set forth.

8. The combination of the ferrule having stud E, socket A', and mortise a^2, the slide, and the trip arranged to engage said slide and provided with extensions *c'*, to fit in mortise a^2, substantially as set forth.

9. The combination of the ferrule having socket A', cross-bridge *c'*, and ways G G, the double-armed slide operating in said ways, and the tripper, substantially as set forth.

10. The improved horse-detacher herein described, consisting of the ferrule having socket A', cross-bridge *c'*, grooves F *f* F', and mortise a^2, the double-armed slide having lateral teats to enter the grooves of the ferrule, and the tripper having a crank-arm at its rear end, teats to enter the groove F of the ferrule, and provided at its outer ends with a trace-retaining hook, substantially as set forth.

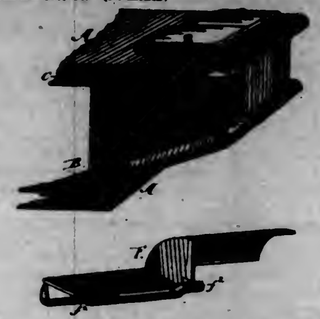
385,133. RIVET-BURR REMOVER. ELIJAH H. PERKINS, Visalia, Cal. Filed Mar. 22, 1888. Serial No. 268,135. (No model.)

Claim.—1. A tool or implement for removing the burrs of rivets, consisting of a tubular stock having holding-teeth upon its lower end for encircling the burr, and a bit fitted within the stock so that it may be rotated, said bit having cutters upon its lower end for cutting the swaged portion of the rivet, substantially as herein described.

2. A tool or implement for removing the burrs of rivets, consisting of a tubular stock having holding-teeth on its lower end for encircling the burr, and a bit fitted within the stock so that it may be rotated therein, said bit having on its lower end cutting-lips for cutting the swaged portion of the rivet and an aperture or hole for receiving the end of the rivet, substantially as herein described.

3. A tool or implement for removing the burrs of rivets, consisting of a tubular stock having holding-teeth on its lower end for encircling the burr, a bit fitted within the stock so that it may be rotated, said bit having cutting-lips and a hole in its inner end, and the spring within the stock, whereby said stock may be pressed down and held stationary while the bit is rotated, substantially as herein described.

4. A tool or implement for removing the burrs of rivets, consisting of the tubular stock having holding-teeth on its lower end, the bit fitted within the stock so as to be rotated therein and having a hole in its lower end and surrounding cutting-lips, the spring within the stock, whereby the stock may be pressed down and held stationary while the bit is rotated, and a nut fitted around the bit and seated in the upper end of the stock for holding the bit in place, substantially as herein described.



5. A tool or implement for removing the burrs of rivets, consisting of a tubular stock having teeth on its lower end, made with outwardly-inclined sharp edges for gripping the edge of the burr, and the rotary bit within the stock having a hole in its lower end, and surrounding cutters, substantially as herein described.

385,134. COCK FOR GAS-FIXTURES. JOHN PRENTISS, New York, N. Y. Filed Feb. 14, 1887. Serial No. 227,621. (No model.)

Claim.—The combination, with the barrel and plug and the stops to limit the motion in turning the plug, of a latch pivoted upon the barrel and its end holding a stop on the plug of the cock when the gas is turned off, substantially as set forth.

385,135. COOK-STOVE. CLARENCE RAYMOND, Albany, N. Y., assignor to the Raymond Stove Company, same place. Filed Apr. 13, 1886. Serial No. 198,709. (No model.)

Claim.—In a cook-stove, the combination of a single flue, C, at the back of the oven, a reservoir-chamber, D', having an opening, E, which forms a communication between said flue and chamber, and a rolling damper, F, provided with a segmental pocket, *f'*, as and for the purpose herein specified.

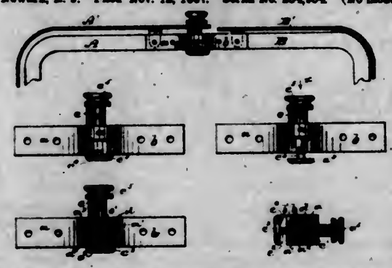
385,136. VELOCIPEDE. THOMAS RENSHAW, Bradford, England. Filed Dec. 1, 1887. Serial No. 256,714. (No model.)

Claim.—1. In a velocipede, the combination, with the backbone or frame, of two forks, one provided with wheel-bearings and the other movably mounted upon the bearing-fork and pivoted to the frame, a spring interposed between the two forks, and a stationary rotating screw and movable nut for adjusting the force of said spring, substantially as described.

2. In a velocipede, the combination, with the backbone or frame, of two forks, one provided with wheel-bearings and the other movably mounted upon the bearing-fork and pivoted to the frame and provided with a tubular portion, a coiled spring within said tubular portion, and a stationary rotating screw and movable nut for adjusting the force of said spring, the said movable nut bearing against the upper end of said spring, and the upper end of the bearing-fork bearing against the lower end of the spring, substantially as described.

3. In a velocipede, the combination, with the backbone or frame, of two forks, one provided with wheel-bearings and the other pivoted to the frame and provided near its upper end with a tube parallel therewith, and a coiled spring within said tube, said fork being also provided with guides *l*, said bearing-fork being provided with ears engaging said guides, and having its upper end extending within said tube and engaging the lower end of said spring, substantially as described.

4. In a velocipede, the combination, with the backbone or frame, of two forks, one provided with wheel-bearings and the other movably mounted on the bearing-fork and pivoted to the frame, a spring interposed between the two forks, a stationary rotating screw and movable nut for adjusting the force of said spring, a dial-plate, and a pointer connected with the movable nut, substantially as described.



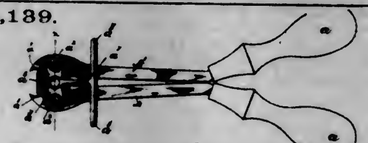
385,137. MALT-KILN. GUSTAV REHBEHMANN, Mayence, Hesse Germany. Filed Aug. 24, 1887. Serial No. 247,776. (No model.)

Claim.—1. In a malt-kiln, the combination, with the malt-kiln floor *d*, of a malt-turner, *a*, and a germ-receiver, *b*, connected thereto, as described, so as to accompany the turner *a* on its way over the floor *d* in both directions, substantially for the purpose as described.

2. In a malt-kiln, the combination, with a malt-kiln floor, *d*, of a malt-turner, *a*, and a germ-receiver, *b*, pulleys *w*, and chains *k*, the latter being wound around said pulleys and connected to the receiver *b* and turner *a*, so as to make the receiver accompany the turner on its way over the floor *d* in both directions, substantially for the purpose as described.

385,138. HINGE FOR TRAVELING-BAGS, &c. CHARLES REHBEIN, Newark, N. J. Filed Nov. 12, 1887. Serial No. 254,904. (No model.)

Claim.—1. A bag-hinge consisting of the portion *a*, provided with a chamber, *c'*, and a journal, a^2, at the joint, the portion *b*, encircling said journal and provided with a stop thereon, a locking-pin moving reciprocally through the chamber *c'* and having a detent thereon which engages with the stop on the portion *b*, and a spring arranged and operating to cause the holding engagement of the said stop and detent, for the purposes set forth.

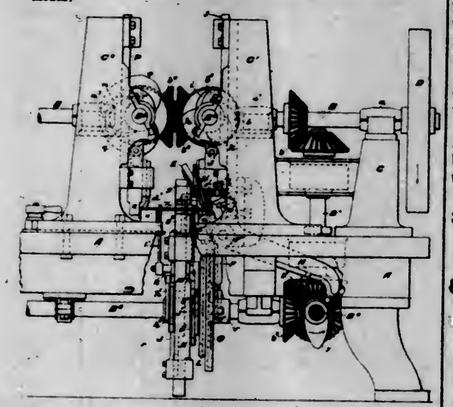


2. The combination, with the frame-sections of a bag, of a hinge therefor consisting of the plates or portions *a* and *b*, secured to said frame-sections, said portion *a* having a chamber, *c'*, and a journal, a^2, the end of the plate *b* being perforated to receive and turn on said journal, and also provided with a recess or stop, *b'*, a spring-actuated locking-pin arranged and moving within and through the chamber *c'* and provided with a lug thereon which engages with the recess or stop *b'*, and a locking device whereby the said locking-pin is prevented from turning within the chamber *c'*, but permits the same to move reciprocally therein, for the purposes set forth.

3. The combination, with a bag-frame, of a bag-hinge consisting of the plates or portions *a* and *b*, adapted to be secured to said frame, said portion *a* having a chamber, *c'*, and a journal, a^2, the portion *b* encircling said journal and provided with a stop thereon, a locking-pin arranged and sliding reciprocally through said chamber and also projecting and moving through the sides of the bag-frame, for the purposes set forth, said locking-pin being provided on one end with a plate, c^2, having a stop thereon, and a finger-piece, c^3, on the opposite end on the outside of the bag-frame, and a spring arranged and operating to cause the automatic holding engagement of said stop and detent, as set forth.

385,139. ROD-CUTTER. HORACE V. ROCHEUX, Fall River, Mass. Filed Dec. 22, 1887. Serial No. 258,781. (No model.)

Claim.—1. In an implement for cutting flat metal straps, bands,



385,139.

or hoops on merchandise, packages, boxes, &c., comprising the levers A A', pivoted to the cross-plates a^2 a^4 at a^3, each of which levers has a handle, a, and the curved cutters a', integral therewith and extending beyond the edge of one of the cross-plates which forms a bed or rest against which the strap or band is drawn and supported during the action of the cutter, substantially as described.

2. The combination of the levers A A', pivoted at a^3 to the plates a^2 a^4 and having the cutters a', the plates a^2 a^4, and the bar or loop a^7, connected with one of the plates and having the stops a^5, substantially as described.

385,140. MACHINE FOR MAKING BUILDING-ANCHORS. JACOB ROEBLI, Brooklyn, N. Y. Filed Feb. 21, 1888. Serial No. 264,726. (No model.)

Claim.—1. The combination of a bed to support the mechanism, a die, c, thereon to support the end of the bar x, a reciprocating presser-foot, d, to hold the anchor-bar down while the work is being performed, a reciprocating plunger-die, f, to form the primary bend for the eye in the end of the anchor-bar, and the reciprocating closing-die c', for closing the eye in said bar, substantially as set forth.

2. The combination of a bed to support the mechanism, a support for the bar, the reciprocating presser-foot, as d, for holding the said bar down firmly while being operated on, and a twister for twisting said bar while thus held, said twister consisting of two reciprocating jaws which move in parallel planes simultaneously in opposite directions, substantially as set forth.

3. In a machine for making building-anchors, the combination of the hollowed die c, the reciprocating plunger-die f, the reciprocating presser-foot d, arranged to bear on the anchor-bar close to the hollow in die c, the anvil or support c' for the other end of the anchor-bar, the reciprocating presser-foot d', and the reciprocating end-bender e, said foot d' serving to hold down the bar while the bend is being made, as set forth.

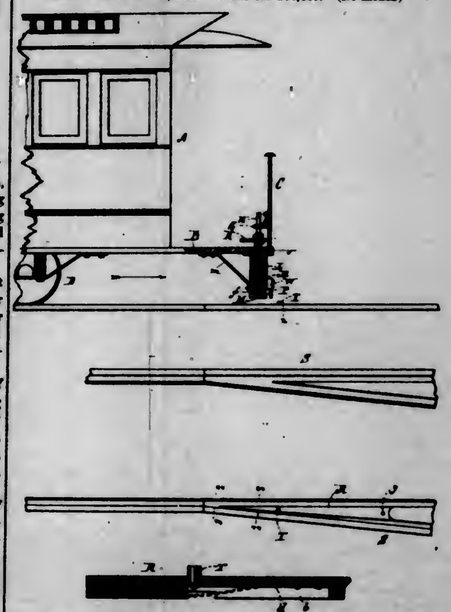
4. The combination, with the bed to support the mechanism, of the hollowed die c, on which the end of the bar x rests, the reciprocating foot d, to hold the bar down upon said die, the trough-like receiver c', for the spear, aligned properly with the die c, as described, the reciprocating pusher t, aligned with and guided in said receiver, and a reciprocating closing-die, c', adapted to close the eye in said bar when the spear is in place, substantially as set forth.

5. In a machine for making building-anchors, a twister for twisting the body of the anchor, comprising two reciprocating jaws, as g' g^2, which move in parallel planes simultaneously in opposite directions, substantially as set forth.

6. The combination, with the shaft B^3, of the slides K and K', mounted in guides and adapted to play in parallel planes, the jaws g' and g^2 on the respective slides, the cams k' and k^2 on shaft B^3, which impart a reciprocating movement to slide K, and the cams i' and i^2 in the shaft B^3, which impart a reciprocating movement to slide K', said slides moving in opposite directions simultaneously, substantially as set forth.

7. The combination, with the machine-bed, the supports for bar x, and the shaft B^3, of the device for discharging or pushing off the finished anchor, said device consisting of the cam L, the lever M, fulcrumed at k', and the upright arm l' of said lever, said arm being arranged to cross the space between said bar-supports in its vibrations, substantially as set forth.

8. The combination, with the machine-bed, of the frame O', mounted in guides thereon, the rack and pinion for effecting the movement of said frame, mounted on the bed and frame, respectively, the main shaft B, having a sliding bearing in said frame, the shaft B^3, mounted in the said frame, the gears b^3, the slides p m, mounted in guides in said frame, the bender e, attached to slide p, the foot d', attached to slide m, the cams n o q r on shaft B^3, for operating said slides, and the anvil or support c' for the bar x, carried by frame O', substantially as set forth.



9. The combination, with the bed and the frame C, of the shaft B^4, mounted in said frame, the slides g and j, mounted in guides in said frame, the cams h i k l on shaft B^4, for operating said slides, the plunger-die f, attached to slide j, the presser-foot d, attached to slide g, and the die c, carried by frame C, substantially as set forth.

10. The combination, with the trough-like receiver c' for the spear y, of the guided pusher t, longitudinally aligned with and adapted to play in said receiver, the lever F, fulcrumed at u and coupled at its upper end with pusher t, the slide-bar v, coupled at its lower end to said lever F, and the cam G, provided with a groove engaged by a stud or roller, w, on rod v, substantially as set forth.

11. The combination, with the hopper E, having inturned ends s s, of the trough-like receiver c' at the bottom of said hopper to receive the lower spear of the series, as set forth.

12. The combination, with the slide j, provided with a hollow or recess, r', at its lower end, of the plunger-die f, secured to said plate below said recess, whereby the metal back of said die is weakened, for the purposes set forth.

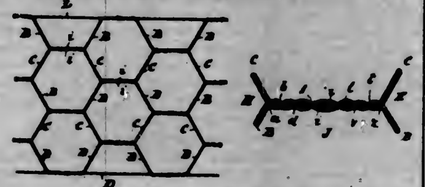
385,141. RAILWAY-SWITCH. STEPHEN R. SABBEN, New Bedford, Mass. Filed Jan. 12, 1888. Serial No. 260,615. (No model.)

Claim.—1. The tongue R, pivoted to the track S and provided with the depressible stud T, in combination with a car adapted to run on said track and its companion track, and provided with means whereby the driver of the car may cause an attachment thereof to engage said stud and move said switch-tongue to switch the car, substantially as described.

2. The car A, having the platform B, provided with the fender C, the rod H, fitted to work vertically in said platform and provided with the spring L, treadle K, elastic arm t, and head P, the rod J, fitted to work vertically in said platform and provided with the spring L, treadle K, elastic arm r, and head Q, said heads being arranged adjacent to each other, in combination with the tongue R, pivoted to the track S and provided with the stud T and spring d, substantially as set forth.

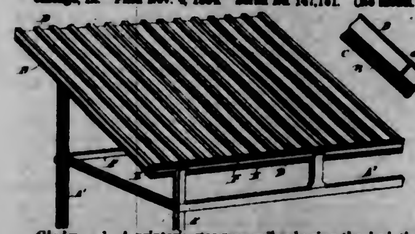
3. The tongue R, pivoted to the track S and provided with a hole for a stud, in combination with a stud, as T, inserted in said hole, and a spring, as d, for said stud, substantially as set forth.

4. In a device of the character described, the combination of the car A, provided with the platform B, the rod H, provided with the spring L and treadle K, the pivoted tongue R, provided with the yielding stud T, and an elastic arm mounted on the lower end of said rod, the outer end or head of said arm being adapted to strike the stud T in the pivoted tongue R as said car passes over the tracks and swing said tongue to switch the car, substantially as set forth.



5. The guard W, in combination with the bracket E, platform B, head P, arm t, and rod H, substantially as described.

385,142. DENTAL PLATE. JAMES F. SARGENT, Manchester, N. H. Filed Sept. 1, 1887. Serial No. 248,548. (Model.)

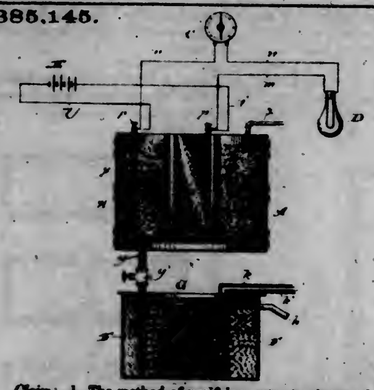


Claim.—A dental plate constructed and adapted to fit on the gums and perforated with a series of holes in its lowest part, which part is arranged to bring said perforations over the apex of the gums, and thereby, and by constructing said perforations so that they are open through their whole length, affording facility for the flow of saliva from under said plate, substantially as and for the purpose set forth.

385,143. WIRE-NETTING. BENJAMIN SEABLER, Clinton, Mass., assignor to the Clinton Wire Cloth Company, same place. Filed Aug. 16, 1886. Serial No. 211,018. (No specimens.)

Claim.—A wire-netting comprising straight selvage-wires and intermediate warp-wires, the intermediate warp-wires being interlocked at intervals by twists which severally comprise a right-hand turn, a left-hand turn, and an intermediate plain portion, one of said warp-wires on each side of the fabric being interlocked at intervals with the adjacent selvage-wire by twists which severally comprise a right-hand turn, a left-hand turn, and an intermediate plain portion, substantially as described.

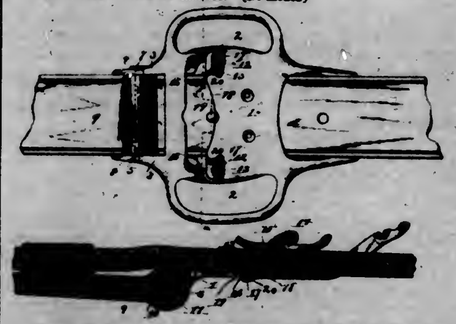
385,144. PRINTER'S STANDING-GALLEY. WILLIAM SAVERIS, Chicago, Ill. Filed Nov. 4, 1884. Serial No. 147,161. (No model.)



Claim.—1. A printer's standing-galley having the bed thereof placed at a vertical incline, the division-strips to separate columns of dead-matter to be distributed being arranged transversely, substantially as and for the purpose set forth.

2. A printer's galley having an inclined bed, the transverse division-strips D, the tube E, provided with perforations e in the inner side and the perforations in the upper side, and the tube J, substantially as and for the purpose described.

385,145. METHOD OF GENERATING ELECTRICITY AND PURIFYING WATER. JOHN E. SMITH, Chicago, Ill. Filed Nov. 7, 1887. Serial No. 254,553. (No model.)



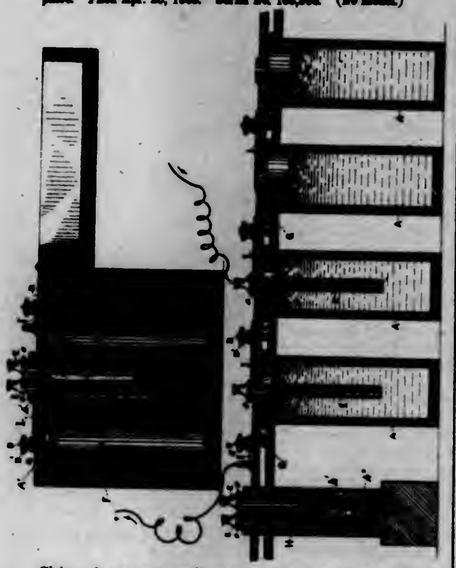
385,145.

Claim.—1. The method of purifying water to abstract from it an inherent substance having a corroding effect on metal, which consists in filtering it through divided pieces of iron or steel and rendering the iron or steel electro-positive to the said inherent substance by connecting it with an electrode electro-negative to the said substance, substantially as described.

2. The method of purifying by galvanic action water containing an inherent substance having a corroding effect on metal and utilizing the water so purified and the electricity excited in the operation of purifying, which consists in employing the water as the exciting-liquid of an electric battery, thereby abstracting the said inherent substance, leading off the purified water to the place of its use, and conducting off to the place of its application the electricity generated by the purifying action, substantially as described.

385,146. TRACE-BUCKLE. BYRON C. SMITH, Auburn, N. Y. Filed Apr. 4, 1888. Serial No. 269,532. (No model.)

Claim.—1. In a buckle, the combination, with the buckle frame or body formed with the transverse opening 19 and with the bearings 12, and provided with the lips or tongues 20, projecting forward and to the sides in the opening toward the inner ends of the bearings, of the bail having its trunnions rocking in the bearings and retained therein by the said lips, and the tongue-plate retained by the bail, substantially as described.



2. In a buckle, the combination, with the buckle frame or body formed with the transverse opening 19 and with the bearings 12 in its sides, and provided at the rear edge of the said opening with the lips or tongues 20, which project forward and to the sides of said opening toward the said bearings, of the bail having its trunnions resting in the said bearings and formed with beveled or shouldered corners at the inner ends of the trunnions, and having the said lips or tongues bearing against the said beveled or shouldered corners and retaining the trunnions in their bearings, and the tongue-plate retained by said bail, substantially as described.

3. The buckle-frame having the open side bearings, 12-12, and the body-plate 1, formed with the arms 20 20 at the front corners of said body-plate opposite the said open bearings, in combination with the bail having its trunnions confined by said arms abutted against them, and a separate tongue-plate, 15, substantially as described, for the purpose specified.

4. The buckle-frame having the open side bearings, 12 12, and the arms 20 20, projecting from the front edge of the body-plate 1 in

a direction toward said bearings and in a plane below the latter, in combination with a bail having trunnions confined within the said open bearings, in the manner stated and shown.

385,147. GALVANIC BATTERY. R. BROWN STARR, Philadelphia, Pa., assignor to the S. S. White Dental Manufacturing Company, same place. Filed Apr. 26, 1888. Serial No. 162,268. (No model.)

Claim.—1. The carbon electrode constituting the containing-vessel of the cell and provided with a surrounding metal terminal ring, said ring being united to said electrode by fastening devices, substantially as described.

2. A cylindrical carbon electrode having a surrounding metal band or ring at its top united to the carbon cylinder by screws having non-oxidizable points.

3. A battery-vessel having a surrounding band or ring at its top detachably connected therewith and forming an electrical connection with said vessel, substantially as described.

4. A battery-vessel having a surrounding band or ring at its top detachably connected therewith and forming an electrical connection with said vessel, a lid or cover resting on said ring, and a clamp-ring having connections with said first-mentioned band or ring to clamp said cover in place, substantially as described.

5. A battery-vessel forming one electrode of a battery, having a terminal ring at its top provided with a locking-piece at one side and a clamp-screw at the side opposite thereto, a cover for said vessel, with an opening therein for the entrance of the other electrode, and a clamp-ring above said cover having a connection with said locking-piece and said clamp-screw, substantially as described, whereby the cover may be securely clamped in place to close said vessel.

6. The combination, with the flexible or elastic top of a battery-vessel having a hole therein for the passage of an electrode, of an electrode having a body portion fitted to pass through said opening, and provided with an enlargement or shoulder at or near its end to rest upon said cover and be supported thereby, substantially as described, whereby said electrode is readily removed from the battery-vessel and readily inserted in place, while the opening closely fits the electrode to make the cell fluid-tight.

7. An electrode having a detachable shoulder band or enlargement at or near one end and a detachable ring or gasket at or near its opposite end to protect it at that point, substantially as described, whereby when the unprotected portion of the electrode in the battery-fluid is consumed the shoulder or enlargement may be detached and applied to the opposite end at the place before protected by the ring or gasket and secured thereto, so as to permit the opposite end of the electrode to be immersed in the battery-fluid, and thus insure a more thorough consumption of said electrode, as set forth.

8. A battery-electrode having one end of its active portion or body which is immersed in the battery-fluid protected or shielded, so as to render the electrode readily reversible, substantially as described.

9. A reversible battery-electrode having a socket at each end for making the circuit-connections, the socket which is immersed being protected from corrosive action by the insertion of a plug therein, substantially as described.

10. A reversible battery-electrode having a socket at each end for connections and a removable suspending shoulder or enlargement at or near one of said ends and a protection for a portion of the electrode at or near the other of said ends, substantially as described.

11. In a galvanic battery having an electrode-preserving vessel or cup containing a cleansing-liquid, a layer or column of mercury to amalgamate the electrodes placed therein, substantially as described.

12. A galvanic-battery apparatus having an electrode-preserving vessel or cup containing a layer or column of mercury to amalgamate the electrodes placed therein, substantially as described.

13. In a preserving vessel or cup to receive the electrodes of a galvanic battery when not in action, a cushion to receive the jar of the entering electrode, substantially as described.

14. In combination with a galvanic battery, a battery-box having a non-conducting support near its top, with an opening or openings therein through which the battery cell or cells are suspended, substantially as described.

15. In combination with a galvanic battery, a battery-box having a non-conducting support near its top, from which the battery cell or cells are suspended, and a detachable cover above said support for said cell or cells clamped upon the upper open end or ends of said cell or cells, substantially as described.

16. In combination with a galvanic battery, a battery-box having a non-conducting support near its top, from which two or more battery-cells are suspended, and a lid or cover for said cells having the coupling connection or connections for said cells attached thereto, substantially as described.

17. In a galvanic battery, the combination of a battery-box having a non-conducting support near its top, two or more carbon or equivalent cells suspended from said support, a lid or cover for said cells carrying the conducting-coupling connection or connections for said cells, and the zinc or equivalent electrode or electrodes of said cells, completing the connection when in place by contact with said coupling connection or connections, substantially as described.

18. The combination, in a galvanic battery, of the series of carbon containing-vessels forming one series of the electrodes of the battery, the terminal rings thereof, and the circuit-connections united at one end to said terminal rings and fitted with openings at the other ends thereof, through which the zinc electrodes are suspended in the battery-liquid, thereby forming an electrical connection between the electrodes of the series of vessels or cells by simply inserting the zincs through said connections, substantially as described.

385,148. PIPE-COUPLING. JAMES S. STEWART, Philadelphia, Pa., and FREDERICK STOTZ, Brooklyn, N. Y. Filed Apr. 22, 1887. Serial No. 235,739. (No model.)

Claim.—1. In an expansion or slip coupling for pipes, the cylindrical sleeve A, having the annular rounded rib *a* integral therewith on its inner wall, and a groove, *b*, between said rib and the end of the sleeve, in combination with the cylindrical pipe B, said rounded rib being adapted to embrace the pipe B at a distance from its end and to hold the pipe B at a distance from the inner wall of the sleeve A, so that its end may be deflected within the coupling, and to serve also as a guide for longitudinal displacement of the pipe B, the groove *b* being adapted to securely hold lead packing against the pipe B, substantially as and for the purpose herein shown and described.

2. In an expansion or slip coupling for pipes, the combination of the sleeve A, having internal annular rib, *a*, integral therewith, and groove *b* between the end of the sleeve and the rib *a*, with the elastic packing *f* between said rib and said groove, lead packing *g* in said groove, and pipe B, said pipe B being adapted to be embraced by the rib *a* and thereby be held at a distance from the inner wall of the sleeve A, so that its end may be deflected within the coupling, substantially as herein shown and described.

3. The coupling A, constructed with the internal rib, *a*, integral therewith, and groove *b* between the end of the coupling and the rib *a*, both forming an expansion and deflectible joint and with the threaded branch *d* for non-expansion joint, substantially as described, and for the purposes herein set forth.

385,149. MAT FOR HORSE-STALLS. LEROY S. STOWE, Berry Mo. Filed Mar. 26, 1888. Serial No. 268,498. (No model.)

Claim.—1. A mat composed of a series of sections, each section composed of two wooden bars having their upper adjacent edges cut away and being bound and held together by bands which support them above the floor, and a metal plate wound with bedding placed between said bars, substantially as and for the purposes hereinbefore set forth.

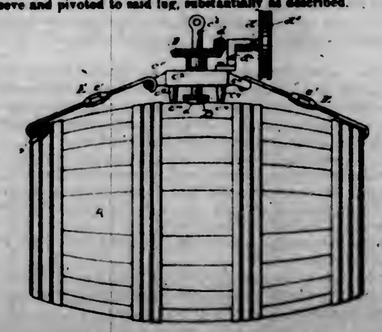
385,149.

2. In a mat for horse-stalls, the combination, with a series of sections composed of bars *a* and plate *d*, arranged as above described, of a bar, *l*, passing through the bars and slot in the middle leg of the plate, substantially as set forth.

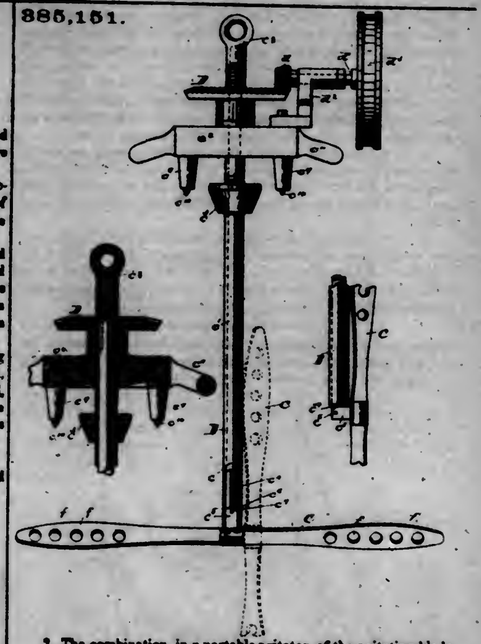
3. A mat for horse-stalls composed of a series of sections united by a transverse bar, each section composed of two wooden bars bound and held rigidly by a band attached to the outer sides of said bars and extending below and underneath them, and a metal strip between said wooden bars pivoted at one end and having a locking device on the other end, substantially as described.

4. In a mat for horse-stalls, the combination, with racks A, having sockets *g* therein, of a series of sections united by a transverse rod, each section composed of two wooden bars held rigidly by a band, and a thin strip between said bars having projections *f* on its ends, the said projections fitting into the sockets of the racks, substantially as described.

385,150. STIRRUP. THOMAS J. TAYLOR, Howell, Tenn. Filed Apr. 28, 1888. Serial No. 271,992. (No model.)



Claim.—1. A stirrup consisting of a curved wooden frame extending from a point beneath the foot over the toe and instep and provided with a strap-connection above, in combination with flexible side pieces, substantially as shown and described.

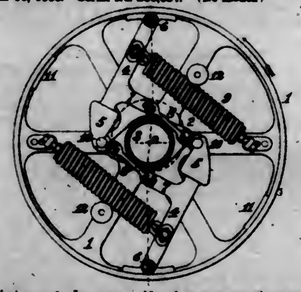


2. A stirrup consisting of a curved frame, A, extending from a point beneath the foot and over the toe and provided with a strap-connection above, in combination with the flexible side pieces, C C, fastened to the edges of the curved frame, and a re-enforcing band, D, extending around the edges of the pocket formed by the stirrup, substantially as and for the purposes described.

385,151. AGITATOR FOR CASKS OR BARRELS. GEORGE M. THOMPSON, Somerville, assignor to Edward H. Ashcroft, Lynn, Mass. Filed June 27, 1887. Serial No. 242,502. (No model.)

Claim.—1. In an agitator for casks or barrels, the combination with the agitating-blade C, having a lug, c^3, projecting at a right angle therefrom, of the sleeve *c* and the shaft c^4, vertically movable in said sleeve and pivoted to said lug, substantially as described.

385,151.

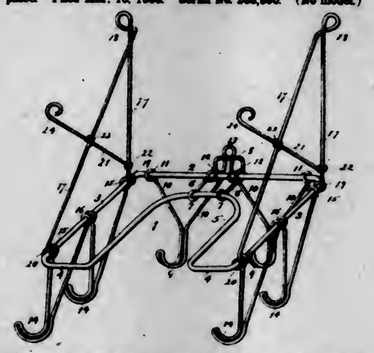


2. The combination, in a portable agitator, of the agitating-blade C, sleeve *c*, shaft c^4, arranged to extend without the barrel, the bevel-gear D d^1, for rotating it, and a lug, c^3, integral with the agitating-blade, or rigidly secured thereto, and extending at a right angle therefrom, connecting the blade C with the end of the shaft, whereby the blade is adapted to have a horizontal position in relation to the shaft and a vertical position in relation thereto, and a locking device for locking the blade to the shaft in its horizontal position when in the barrel, substantially as described.

3. The combination, in an agitator, of the support c^5, the sleeve *c*, the shaft c^4, contained in the sleeve, and a device for moving it vertically therein, the agitating-blade C, and the lug c^3, integral with the agitating-blade, or rigidly secured thereto, and extending at a right angle therefrom and connecting it with the lower end of the said shaft c^4, as and for the purposes described.

4. The combination, in an agitator, of the shaft c^4, the tube c^7, the agitating-blade C, its lug c^3, integral with the blade, or rigidly secured thereto, and extending at a right angle therefrom, the block or support c^5, for supporting the shaft and tube, and its legs c^9, having the points c^{10}, the said block or support being adapted to bear against the side of the barrel over the bung-hole, the bevel-gear D, bevel-gear d^1, the shaft d^2, and the pulley d^3, supported by said block c^5, the agitator-shaft-adjusting nut c^6, the ears or lugs c^{11} upon said block c^5, and tying-rods G, for connecting the said block with the chines of the barrel, substantially as described.

385,152. GOVERNOR. JOSEPH W. THOMPSON, Salem, Ohio, assignor of one-half to the Buckeye Engine Company, same place. Filed Jan. 16, 1886. Serial No. 208,987. (No model.)



Claim.—1. In a centrifugal governor, the combination of a

supporting-case, a weight-arm pivoted thereto, a movable eccentric, and a link coupling the eccentric and weight-arm, the pivots connecting the link to the eccentric and to the weight-arm being so relatively located that the arcs described by said pivots shall be substantially tangential one to the other, and that each of said pivots may be brought into line with the centers of the case and of the weight-arm pivot in positions of the weight-arm within and adjacent to the outer and the inner limits of its range of movement, substantially as set forth.

2. In a centrifugal governor, the combination of a supporting-case, a weight-arm pivoted thereto, a spring coupled at its ends to the weight-arm and to the case, and a stop connected to the case in position to abut against the outer surface of the spring, substantially as set forth.

3. In a centrifugal governor, the combination of a supporting-case, a weight-arm pivoted thereto, a spring coupled at its ends to the weight-arm and to the case, a stud fixed in the case exterior to the spring, and a friction-roller mounted on the stud and abutting against the outer surface of the spring, substantially as set forth.

385,153. FOLDING HAT AND COAT RACK. GAYNER D. TOLMAN, Shawano, Wis., assignor to himself and Lorenzo D. Roberts, same place. Filed Mar. 10, 1888. Serial No. 266,990. (No model.)

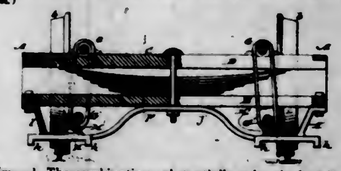
Claim.—1. A folding coat and hat frame, consisting of a shelf formed of wire upon which hats may be placed, side frames hinged thereto, with loops to attach them to nails or other supports, and hooks pivoted to the rear and sides of the shelf, the several parts being constructed of wire and adapted to be folded up together, substantially as described.

2. A combined hat and coat rack, consisting of a shelf forming a support for hats, and having folding double hooks pivoted to its sides and rear, and folding side frames with extended brace-hook arms, and looped ends adapted to be attached to nails or other retaining devices, the several parts being formed of wire and adapted to be folded up together, substantially as described.

3. The combination, with a shelf for supporting hats, formed of a single piece of wire and having a rear wire brace with vertical projection, of double hooks formed of a single piece of wire pivoted to the rear of said shelf, and having an extended portion adapted to bear against the vertical projection at the rear of the shelf, double hooks formed of a single piece of wire pivoted to the shelf, and having braced hook-arms and suspending-loops, the several parts folding together, substantially as described.

4. A folding hat and coat frame, consisting of the shelf 1, having folding side frames, 17, with loops 18 and brace-arms 21, with hooks 24, folding double hooks 9 and 14, the frame 1, having brace-wire 6, with vertical projection 8, and the hooks 9, having extended portion 13, adapted to bear against said vertical projection 8, substantially as described.

385,154. GLOVE. WILLIAM VAUGHAN, Torrington, County of Devon, England. Filed Feb. 16, 1888. Serial No. 264,180. (No model.)



Claim.—1. A fabric glove having rows of stitching transversely of the upper and lower surfaces of the tips of its fingers, between the

seams which unite said fingers and their fourchettes, and also having rows of stitching completely encircling the tip of its thumb, substantially as shown and described.

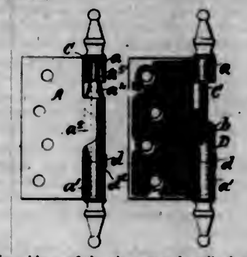
2. A fabric glove of single thickness having in the front and back of its finger-tips and around the tip of its thumb transverse rows of stitching of coarser thread than that forming the fabric of the glove, substantially as shown and described.

385,155. SAFETY-GUARD FOR CAR-TRUCKS. WILLIAM H. WALKER, Martinez, Ga. Filed Feb. 3, 1888. Serial No. 262,948. (No model.)

Claim.—1. The combination, substantially as herein described and shown, of the truck provided with beams D and E, the spring interposed between beams D and E, the guard having end shoes, H H, the cross-plate or connection J, extended between the shoes at the opposite sides of the truck and secured to the beam E, the links G, lapped over the beams D E, and having bearings G' at their lower ends, the lugs H', projected upwardly from the guard and engaging bearings G', and the braces I for the outer ends of the shoes, all substantially as and for the purposes specified.

2. The herein-described safety-guard for car-trucks, consisting of the cross brace or connection arched upward at its center, shoes supported at the ends of said connection, the short brace-bars projected upward from the inner ends of said shoes, and the brace-brackets projected upward from the outer ends of said shoes, substantially as set forth.

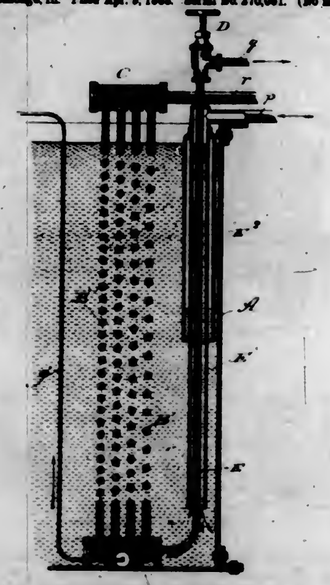
3. The combination, with the truck and bearings G' supported thereon, of the guard comprising shoes and a connection-bar extended between said shoes, lugs H', projected from the guard and engaging bearings G', and brace I', extended from the guard and secured to the truck, all substantially as and for the purposes specified.



4. The combination of the truck-frame, the links G, and the guard secured to the truck-frame and having short upwardly-projected lugs H', engaging the lower ends of the links G, substantially as set forth.

5. The combination, with the truck, of the guard having two shoes at each side of the truck, and having brackets I, secured to the truck-frame, and connections uniting the two shoes at each side of the truck, substantially as set forth.

6. The truck having links G, provided with bearings G', the guard, and the lugs H', projected therefrom and engaging the bearing G', substantially as set forth.



7. The truck having beams D and E and interposed spring F, and provided with links G, having bearings G', and the guard secured to the truck-frame and having lugs engaging the bearings G', substantially as set forth.

385,156. HINGE. JULIUS WEIS, Chicago, Ill., assignor of one-third to James R. Wiggins, same place. Filed Dec. 17, 1887. Serial No. 258,169. (Model.)

Claim.—In a hinge of the character described, the combination, with the leaf A, provided with the central knuckle, a^2, having a spiral surface on the under side, of the independent or loose knuckle D, having the upper side cut away in a corresponding plane and provided with the transverse slot b', the leaf B, the knuckle a' thereof, provided with the vertical slot b^2, which extends into the knuckle D, and the angular key adapted to be inserted in said slots, whereby these parts are rigidly locked together or disengaged, as may be required, substantially as and for the purpose set forth.

385,157. ICE OR REFRIGERATING MACHINE. FREDERICK W. WOLF, Chicago, Ill. Filed Apr. 9, 1883. Serial No. 270,081. (No model.)

Claim.—1. In combination with the condenser of an ice or refrigerating machine, a pipe, E, connecting the lower end of the condenser-coil through the condenser-tank with the regulating-valve D, and provided with a jacket, E', communicating from near its upper end with the water-supply, substantially as described.

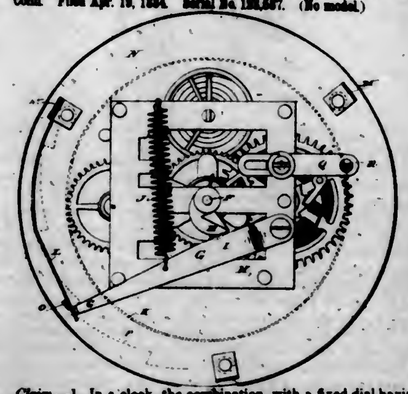
2. In combination with the condenser of an ice or refrigerating machine, a pipe, E, connecting the lower end of the condenser-coil through the condenser-tank with the regulating-valve D, and provided with a jacket, E', communicating from near its upper end with the water-supply, and an air-jacket, E², in the tank surrounding the jacket E', substantially as described.

3. In combination with the condenser of an ice or refrigerating machine, manifolds C and C' at opposite ends of the condenser coils, and a pipe, E, connecting the manifold C' through the condenser-tank with the regulating-valve D, and provided with a jacket, E', communicating from near its upper end with the water-supply, and an air-jacket, E², in the tank surrounding the jacket E', substantially as described.

385,158. SAFETY-SEAL FOR CHECKS. ANNA M. WOODRUFF, Freehold, N. J. Filed Apr. 2, 1887. Serial No. 233,414. (No model.)

Claim.—1. As a new article of manufacture, a safety-seal consisting of a disk or plate having one surface coated with a viscid material and provided with a central aperture and a semi-transparent flap covering said aperture, the whole being adapted to be applied over a character to prevent it from being tampered with, as set forth.

2. The combination, with a check, of a centrally-apertured disk and a semi-transparent flap, a stratum of viscid material and the flap being arranged between the check and the disk, substantially as described.

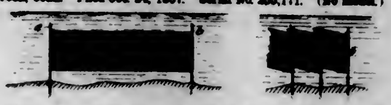


385,159. CUSPIDOR. JOHN P. ANSEN and FRED H. FOX, Chicago, Ill. Filed Jan. 10, 1888. Serial No. 260,273. (No model.)

Claim.—1. In a cuspidor, the combination of the body A and the lugs H and H', combined with the handle D, T-shaped projection E, ends e and e', and grooves b and b', all arranged substantially as set forth and described.

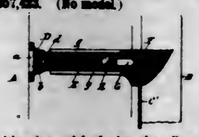
2. In a cuspidor, the combination, with the body A, having the ridge J, of the hinge a, the bottom B, eye G, rubber ring I, lever-hook C, and pivot F, all as and for the purpose substantially as set forth and described.

385,160. CLOCK-DIAL. ARCHIBALD BARRATTER, Waterbury, Conn. Filed Apr. 19, 1884. Serial No. 128,867. (No model.)



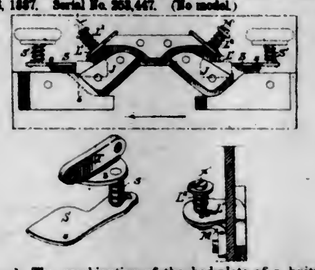
Claim.—1. In a clock, the combination, with a fixed dial having an opening in it, of a movable dial located behind such fixed dial, two ratchets carried by the movable dial, and means, substantially as shown, for engaging with such ratchets to hourly shift the movable dial and limit its forward movement, substantially as set forth.

2. In a clock, the combination, with a fixed dial having an opening in it, of a movable dial located behind such fixed dial, two ratchets carried by the movable dial, a locking-finger engaging with one ratchet, and a lever engaging with the other ratchet to turn the movable dial and operating to disengage such locking-finger from the ratchet with which the same engages, substantially as set forth.



3. In a clock, the combination, with a fixed dial having an opening in it, of a movable dial located behind such fixed dial, two ratchets carried by the movable dial, a locking-finger engaging with one ratchet, a lever engaging with the other ratchet to turn the movable dial, and a finger engaging with the ratchet engaged by the lever and holding the dial between the intervals of its hourly actuations, substantially as set forth.

385,161. OBTAINING OYSTER-SPAT. OLIVER R. BRAGG, Stony Creek, Conn. Filed Oct. 24, 1887. Serial No. 253,171. (No model.)

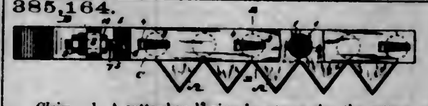


Claim.—The herein-described method for obtaining oyster-spat, consisting in submerging and securing upon the oyster-grounds a surface coated with a soft plastic-like material which adheres to the said surface, the said coating forming the surface upon which the sets may form, substantially as described.

385,162. ROCK-HINGE. THEODORE S. REESE, Albany, N. Y., assignor of one-half to Herman M. Darnell, same place. Filed Dec. 9, 1887. Serial No. 257,623. (No model.)

Claim.—The combination, with the bracket D and the latch-hook having with its head end the incline *f* and holding-slot *f'*, and the arm *f²*, provided with the longitudinal slot G and flanges *g g*, of the arm E, pivoted to said bracket at one of its ends and secured to the slotted arm of the latch-hook by the set-bolt H, substantially as and for the purposes set forth.

385,163. KNITTING-MACHINE. DAVID C. BELLIS, Philadelphia, Pa., assignor of one-half to Sigmund H. Wolfenmayer, same place. Filed Oct. 26, 1887. Serial No. 253,447. (No model.)



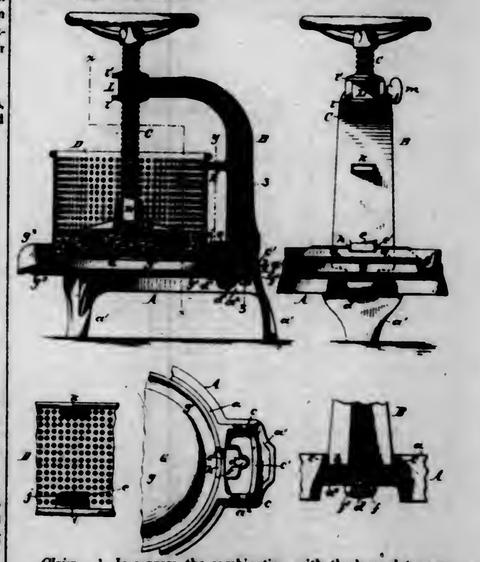
Claim.—1. The combination of the bed-plate of a knitting-machine, the cam-cylinder, and a needle-cylinder, with a supporting-cylinder for the latter, flanged at its lower end and secured to the bed-plate, and a cam-ring on the flange of the supporting-cylinder to raise and lower the needle-cylinder, all substantially as specified.

2. The combination of the needle-cylinder of a knitting-machine, having needles, some with long projecting bits and others with short projecting bits, with a cam-cylinder having a needle-rest, a cam adapted to slide laterally into and from said needle-rest, devices for pushing the said cam inward and drawing it outward, and means for restricting the inward movement before the cam reaches a position to act upon the short bits of the needles, all substantially as specified.

3. The combination of the needles and needle-cylinder of a knitting-machine, with a cam-cylinder having a needle-rest, a cam adapted to slide laterally in said cylinder, a cam-lever to push the said cam inward and springs to draw it outward, and a tripping-pin acting on said cam-lever as the latter rotates with the cam-cylinder, all substantially as specified.

4. The combination of the cam-cylinder of the machine and its fixed cam with the cam-nose, a spring acting thereupon to hold it in operative position, and a pivot-pin for said cam-nose, inclined in respect to the vertical, whereby said cam-nose has an upward and backward yielding movement, all substantially as specified.

385,164. CUTTING APPARATUS FOR HARVESTERS. JAMES A. BLAIR, Philadelphia, Pa., and WILLIAM G. BIRD, Wilmington, Del. Filed Jan. 19, 1888. Serial No. 261,264. (No model.)



Claim.—1. A cutter-bar having lugs to receive the cutters, and tongues on said lugs tapered toward the outer end of the bar, and a boss at its inner or heel end, a locking-bar with slots tapered to correspond with the tongues and having hook-shaped lugs at one end, a draft-screw passed through said boss and having a cross-head to engage said lugs, and a nut working on said screw against said boss, said parts being combined substantially as described.

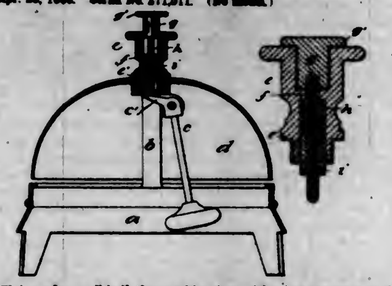
2. In a cutting apparatus for harvesters, the combination of the cutter-bar, the knives, and the locking mechanism therefor, of a draft-screw for the locking-bar, a boss on the cutter-bar, forming a bearing for said screw, a nut threaded on the screw to bear against the boss and having teeth on its rim, and a rocking and sliding dog adapted to engage a tooth on said nut to prevent said nut from unscrewing, said dog being secured in a T-shaped slot in the side of the bearing for the screw, and having a handle wherewith the dog is operated, substantially as described.

3. In a cutting apparatus for harvesters, the combination of the cutting-bar having a boss thereon, the knives or cutters, a locking-bar, a draft-screw passing through said boss and having a cross-head securing it to the locking-bar, a nut working on said draft-screw against said boss and having a toothed rim, and a dog secured to said boss adapted to engage the teeth of said rim, substantially as described.

385,165. DOMESTIC HAND-PRESS. JOHN W. CONDON, CHARLES G. SHEPARD, and PETER ADAMS, Buffalo, N. Y.; said Condon and Adams assignors to Walter J. Shepard, same place. Filed Jan. 9, 1888. Serial No. 260,194. (No model.)

Claim.—1. In a press, the combination, with the base-plate provided with an extension, a^3, having an opening, of the standard B, resting upon said extension and provided with a lug or hook engaging under the base-plate, and a fastening-screw whereby the standard is secured to the base-plate, substantially as set forth.

2. In a press, the combination, with a base-plate, A, provided with an extension, a^3, having an opening, d', and lips or flanges *e*, of the standard B, provided at its lower end with a base-flange, *b*, and a lug, *d*, engaging under the base-plate A, and a screw-bolt, *f*, whereby the standard is secured to the extension a^3, substantially as set forth.



3. The combination, with the base-plate A, cylinder D, and standard B, provided with a lug or projection, *e*, of the removable pan G, provided with a recess, A, in which said lug engages, substantially as set forth.

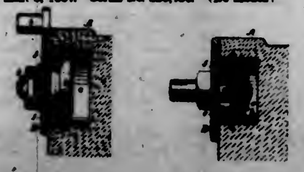
4. The combination, with the base-plate A and the standard B, provided with a lug or projection, of the cylinder D, provided with a lug engaging with the lug of the standard, substantially as set forth.

5. The combination, with the base-plate A and the standard B, provided with a lug or projection, *e*, of the cylinder D, provided with a lug, *i*, adapted to be interlocked with the lug *e*, and a lug or support, *k*, formed on the standard B, and against which the upper portion of the cylinder D bears, substantially as set forth.

6. In a press, the combination, with the base-plate A and the standard B, provided with a lug, *e*, of the removable pan G, provided with a recess, A, engaging under the lug *e* of the standard, a cylinder, D, provided with a lug, *i*, also engaging under the lug *e* of the standard, a lug, *k*, formed in the standard and bearing against the upper end of the cylinder D, a follower, E, provided with a socket, *n*, and a feed-screw seated loosely in the socket *n* and provided with a screw-nut, L, arranged in a recess in the standard, substantially as set forth.

385,166. CALL-BELL. JOHN P. CONNELL, Kensington, Conn. Filed Apr. 20, 1888. Serial No. 271,511. (No model.)

Claim.—In a call-bell, the combination, with a base to support the bell, a sounding-shell, and a hammer pivotally supported in the sounding-shell and provided with a tappet-arm, of a push-pin sleeve, *e*, formed with a diaphragm, *f*, having a central aperture, and the push-pin *h*, fitted to reciprocate through the aperture in the diaphragm, and provided with pistons *g h*, arranged with a space between their approaching ends, whereby the strokes of the push-pin are limited in both directions, substantially as described.

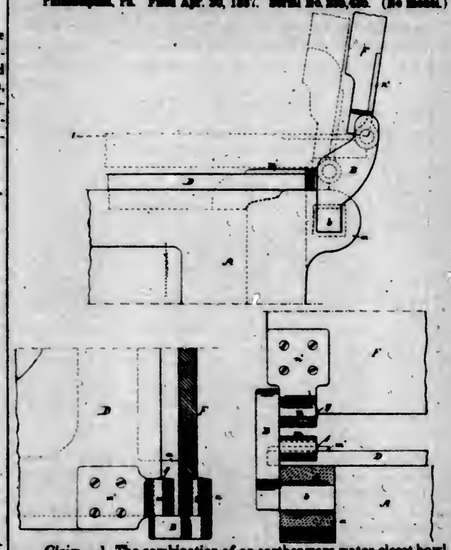


385,167. WATER-CLOSET. WILLIAM S. COOPER, Philadelphia, Pa. Filed Dec. 30, 1886. Serial No. 222,966. (No model.)

Claim.—1. The combination of the earthenware bowl of a water-closet, hinge-plates for the lid or seat, securing-bolts for said plates adapted to recesses in the bowl, and elastic bushings interposed between said bolts and the walls of the recesses, all substantially as specified.

2. The combination of the bowl having recesses, the hinge-plates, the confining-bolts therefor, elastic bushings adapted to the recesses of the bowl, and sleeves confined to said bushings and receiving the bolts which secure the hinge-plates, all substantially as specified.

385,168. WATER-CLOSET. WILLIAM S. COOPER, Philadelphia, Pa. Filed Mar. 6, 1887. Serial No. 229,736. (No model.)



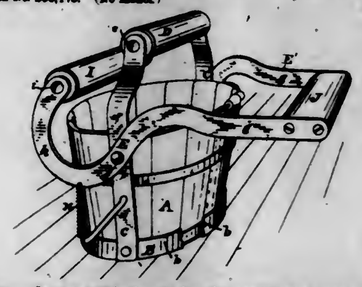
385,168.

Claim.—1. The combination of the recessed bowl of a water-closet, a hinge-plate, a securing-bolt therefor, having a head or nut contained within said recess, and an elastic bushing subjected to the pressure of said head or nut and expanded thereby against the walls of the recess, all substantially as specified.

2. The combination of the bowl of a water-closet having a recess therein, a hinge-plate, a ring, a bolt for securing the hinge-plate, and an elastic bushing compressed between said ring and the head or nut of the bolt, and expanded thereby against the walls of the recess, all substantially as specified.

385,169. WATER-CLOSET STRUCTURE. WILLIAM S. COOPER, Philadelphia, Pa. Filed Apr. 30, 1887. Serial No. 236,625. (No model.)

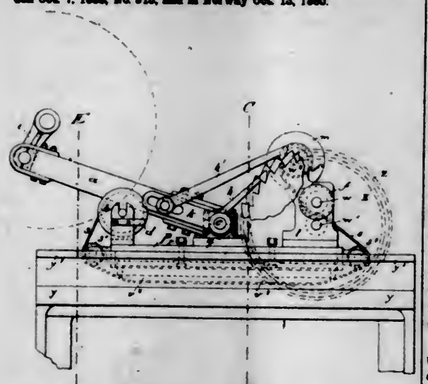
Claim.—1. The combination of an earthenware water-closet bowl, a lid or seat therefor, and a hinge having one part secured to said lid or seat and the other part secured directly to the bowl, all substantially as specified.



2. The combination of an earthenware water-closet bowl, with a seat and cover both hinged directly to the bowl, all substantially as specified.

3. The combination of the earthenware bowl of a water-closet, having a recess therein, a plate having a shank adapted to and secured within said recess, and a seat or lid hinged to said plate, all substantially as specified.

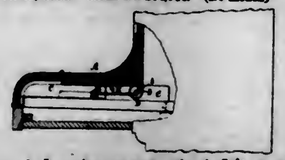
4. The combination of the earthenware bowl of a water-closet, having a recess therein, with a hinge-plate having a shank adapted to and secured within said recess, and with a seat and lid both hinged to said hinge-plate, the axis of the lid-hinge being in a higher plane than that of the seat-hinge, all substantially as specified.



5. The combination of the earthenware bowl of a water-closet, having a recess therein, a plate having a shank adapted to and secured within said recess, and two laterally-projecting hinge-pintles, one of which is in a higher plane than the other, a seat hung to the lower pintle, and a lid hung to the upper pintle, all substantially as specified.

385,170. MOP-WRINGER. JESSE A. CRANDALL, Brooklyn, N. Y., assignor of one-half to John Wood, same place. Filed July 16, 1888. Serial No. 209,173. (No model.)

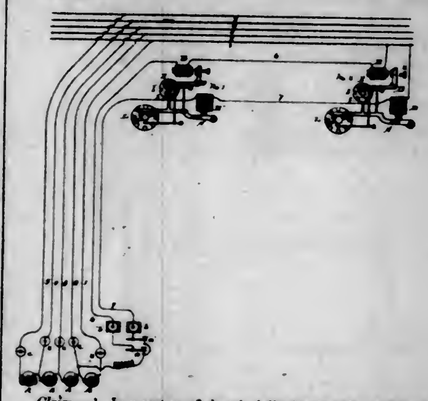
Claim.—In a mop-wringing device, the combination, with the bottom band, B, having diametrically-opposite uprights C C, bent toward each other at their tops, and having a roll, D, journaled between them in their upper ends, of the spring-actuated angular levers E E', pivoted near their ends on the uprights C C, and having their arms rigidly connected by a suitable foot-piece, and their arms A having a roll, I, similar to roll D, all constructed and arranged substantially as and for the purpose described.



385,171. POLISHING APPARATUS FOR WOOD, &c. THEODOR DAVIDS, Hanover, Prussia, Germany. Filed Feb. 2, 1887. Serial No. 226,293. (No model.) Patented in Germany Jan. 20, 1886, No. 32,290; in Austria-Hungary Sept. 30, 1885, No. 30,463 and No. 67,306; in Sweden Oct. 7, 1885, No. 312, and in Norway Oct. 12, 1885.

Claim.—1. The combination of the sledge P and means for moving it to and fro with the adjustable filling-block v^2, the two grinding-cloth rollers *b* and *m*, the grinding-cloth *a*, the spur-wheel *x'*, with pawl *h* on the connecting-rod *o*, the rollers *w' w*, and the strap-gear *f f'*, for the purpose specified.

2. The combination of the sledge P and means for moving it to and fro with the adjustable filling-block v^2, the adjusting-screws *r*, the grinding-cloth rollers *b* and *m*, the guide-rollers x' x^2, the transporting-rollers *w' w*, the transporting cog-wheel *x'*, the pawl *h* on the connecting-rod *o*, and the strap-gear *f f'*, substantially as described.



385,172. PIANO-CASE. ALPHONSO F. DELANO, Hyde Park, assignor to the South American Organ and Piano Company, Boston, Mass. Filed Feb. 23, 1888. Serial No. 264,913. (No model.)

Claim.—1. In a piano or organ, the shaft *k*, arranged in bearings in the case, as shown, and having pulleys, the bands connected with said pulleys and with the lid and arranged with each as set forth, and the hangers E, sustaining the shaft in its relation to the lid and serving to limit the said lid in either its inward or outward movement, all substantially as shown and set forth.

2. In a piano or organ, the combination of the lid with the shaft and its pulleys and bands arranged with each other, as shown, and the hangers serving both to connect the shaft with the lid and as stops to limit the said lid in its inward and outward movements, substantially as shown and set forth, all being arranged in the case as represented.

385,173. SYSTEM OF ELECTRICAL DISTRIBUTION. THOMAS A. EDISON, Llewellyn Park, N. J. Filed Dec. 9, 1887. Serial No. 257,269. (No model.)

Claim.—1. In a system of electrical distribution, the combination of two or more electrically-operated switches, two or more simultaneously electrically-controlled stops—one for each switch—such stops being situated or arranged differently relative to their respective switches, whereby any particular switch can be released for action while the others are held from action by the stops, and a circuit controlled by each switch, substantially as set forth.

2. In a system of electrical distribution, the combination of a main circuit extending from a central station, two or more branch circuits supplied therefrom, a switch for each of said branch circuits, a magnet for operating each switch, a circuit from the station including all said magnets, a circuit-breaker in said circuit at the station, a movable stop for each switch, such stops being situated or arranged differently relative to their respective switches, a magnet controlling the position of each stop, a circuit from the station including all said stop-magnets, and a circuit-breaker in said circuit at the station, substantially as set forth.

3. In a system of electrical distribution, the combination of a main circuit composed of four or more conductors, house-circuits, each connected in multiple arc with a pair of said conductors, and switches for certain of said house-circuits, controlled from the central station, for shifting the connections thereof progressively from one pair of conductors to the other pairs, substantially as set forth.

4. In a system of electrical distribution, the combination of a main circuit composed of four or more conductors, a switch having a suitable number of contact-plates, connections from pairs of said plates to the main conductors, two arms bearing on said plates and movable relative thereto, and a house-circuit connected with said arms, whereby the movement of said arms shifts the connections of said house-circuit from one pair of main conductors to another, substantially as set forth.

5. In a system of electrical distribution, the combination of a main circuit composed of four or more conductors, house-circuits, each connected in multiple arc with a pair of said conductors, switches for certain of said house-circuits, for shifting the connections thereof progressively from one pair of conductors to the other pairs, and magnets controlled from the central station for operating said switches, substantially as set forth.

6. In a system of electrical distribution, the combination of a main circuit composed of four or more conductors, a switch having a suitable number of contact-plates, connections from pairs of said plates to the main conductors, two arms bearing on said plates and movable relative thereto, a house-circuit connected with said arms, whereby the movement of said arms shifts the connections of said house-circuit from one pair of main conductors to another, and a magnet controlled from the central station for operating said switch, substantially as set forth.

7. In a system of electrical distribution, the combination of a main circuit extending from a central station, two or more branch circuits supplied therefrom, a switch for each of said branch circuits, a magnet and an armature-lever for operating each switch, a circuit from the station including all said magnets, a circuit-breaker in said circuit at the station, a rotating stop-disk for limiting the movement of each of said armature-levers, said disks each having a notch and such notches being all located at different points on the disks' peripheries, a magnet and suitable gearing controlled thereby for revolving each disk, a circuit from the station including all said magnets, and a circuit-breaker in said circuit at the station, substantially as set forth.

8. In a compensating system of electrical distribution, the combination, with the main and compensating conductors forming the main circuit, of branch circuits connected therewith and unisoned switching mechanism controlled from the central station, for independently controlling said branch circuits, substantially as set forth.

9. In a system of electrical distribution, the combination of the switches revolved by electro-magnets controlled from the station, the stop-disks for said switches revolved by other magnets controlled from the station, unison-stops for the switches, unison-stops for the disks, releasing devices for the stop-disk unisons operated by the switch-magnets, and releasing devices for the switch-unisons operated by the stop-disk magnets, substantially as set forth.

10. In a system of electrical distribution, the combination of a main circuit composed of four or more conductors, switches, each having a suitable number of contact-plates, connections from pairs of contact-plates in each switch to the main conductors, two arms bearing on the plates of each switch and movable relative thereto, a house-circuit connected with the arms of each switch, a magnet for operating each switch, a circuit from the station including all said magnets, a circuit-breaker in said circuit at the station, a movable stop for each switch, such stops being situated or arranged differently relative to their respective switches, a magnet controlling the position of each stop, a circuit from the station including all said stop-magnets, and a circuit-breaker in said circuit at the station, substantially as set forth.

385,174. POTTED-PLANT SUPPORT. FREDERIK S. FARRINGTON, Cohoes, N. Y. Filed Oct. 21, 1887. Serial No. 253,033. (No model.)

Claim.—A potted-plant support consisting of the pan A, having the screw-nut B secured in the bottom thereof, a bracket having a screw-threaded outer end, said outer end being in engagement with the screw-nut aforesaid, and the cock C in the side of the pan, in combination with the plate D, provided with an upwardly and a downwardly extending flange, as specified, said plate being perforated, substantially as described, and for the purposes set forth.

385,175. FLOUR-MILL. JAMES J. FAHLBERG, Jackson, Mich. Filed Aug. 17, 1888. Serial No. 211,128. (No model.)

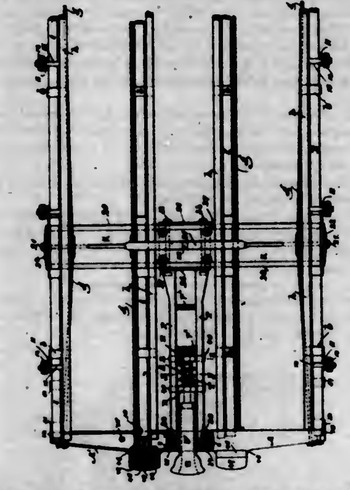
Claim.—1. The combination, with a casing having a grain-feed and a rotary beater located within the casing, of a series of adjustable grate-bars located in a plane between the planes of the beater and grain-feed, substantially as set forth.

2. The combination, with a casing and an exhaust-chamber in open communication therewith, of a rotary beater located within the casing below the exhaust-chamber, a series of adjustable grate-bars arranged in arched form above the beater, and a flour-conducting pipe connected with the exhaust-chamber, substantially as set forth.

3. The combination, with a tapered exhaust-chamber, a beater-casing, and a set of adjustable grate-bars separating said chamber and casing, of a grain-feed at small end of the exhaust-chamber and an exhaust-fan at the large end of said exhaust-chamber, substantially as set forth.

4. The combination, with a flaring casing and the winged beater journaled therein, of the exhaust-chamber located above the beater, the exhaust-fan in open communication with the exhaust-chamber, and the valves or dampers in the end of the casing for regulating the force of the draft, substantially as set forth.

5. In a pulverizing-mill, the combination, with one or more revolving beaters provided with corrugated or roughened surfaces, of an impact-plate and grate-bars located above the beaters and having corrugated or checked surfaces, substantially as set forth.



385,176. SICKLE-GRINDER. JOSEPH W. GARDLE and LEVI M. RUFF, Casey, Iowa. Filed Aug. 6, 1887. Serial No. 246,262. (No model.)

Claim.—1. The combination of the frame, the rotating shaft having the series of detachable grindstones N, the vertically-adjustable bearing-blocks, the sickle-holder journaled therein, and the screw to bear upon the upper side of the sickle-holder, substantially as described.

2. The combination of the longitudinally-adjustable frame, the rotating shaft L, journaled therein, the series of detachable grindstones secured to the said shaft, and the sickle-holder, substantially as described.

385,177. METALLIC PLATFORM FOR RAILWAY-CARS. JAMES T. GOODRLLEW, Troy, N. Y., assignor to the Iron Car Company, Stamford, Conn. Filed June 15, 1887. Serial No. 241,266. (No model.)

Claim.—1. The combination, with the tubes and truss-bolts in a car-platform, of cast-metal end sill's that are hollow and box-shaped, and provided with sockets cast with the end sill for the reception of the ends of the tubes, and holes for the passage of the truss-rods, substantially as set forth.

2. The end sills for car-platforms, each formed of right and left hand parts, in combination with the splice-piece C and yoke-piece B for uniting the two parts of the end sill together, substantially as set forth.

3. The combination, with the draw-bar, spring, and followers, of a cast-metal draw-frame composed of two bars, each of which is made in one piece, having holes near the ends for attaching the same firmly in place, and supports for the movable followers at the ends of the spring, substantially as specified.

4. The combination, with the end sill and transom-beam, of draw-

frames, each of which is made with openings and flanges for stiffening the metal, and a boss or circular projection upon the draw-frame, entering a recess in the end sill, and bolts for connecting the respective parts, substantially as set forth.

5. The combination, with the longitudinal tubes, the transom-beam, truck, and king-bolt, of the king-bolt plates, one of which has a cone-shaped projection and the other a similar-shaped recess, and a cylindrical projection on one entering a similar recess in the other, substantially as set forth.

6. The combination, with the transom-beam and the draw-frames, of the upper king-bolt plate having tubular flanges upon the same and the bolts for connecting the ends of the draw-frames with the king-bolt plate, substantially as set forth.

7. The combination, with the draw-frames, draw-bar, and spring, of follower-plates, each one of which is hollow and box-shaped and provided with internal ribs, and with a central hole, and the draw-bar bolt passing through the spring follower-plates and into the draw-bar, substantially as set forth.

8. The combination, with the T-shaped tie-bar *c* and the truss-bolts *g*, of the saddle adapted to receive the T-head of the tie-bar and grooved on the under side for the truss-bolt, substantially as set forth.

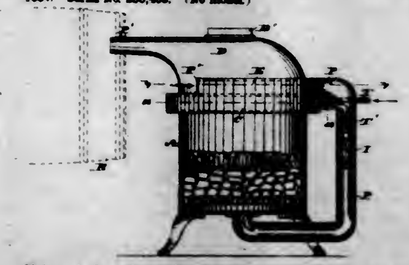
9. The transom-beam of wood with trough-shaped metal bars at its sides, in combination with the metal tubes of the car-frame, the floor-sills, the tie-rod passing across the tubes and through the end portions of the transom-beam, and the end plates through which the tie-rod passes, substantially as set forth.

10. The combination, with the metallic tubes in a car-platform, of the U-shaped step, the clip-piece passing around the metallic tube, the coupling-pieces at the upper ends of the step, and the bolts passing through the same and through the clip-pieces, substantially as set forth.

11. The combination, with the longitudinal sills in a car-platform, of hollow box-shaped metallic end sills having sockets or recesses cast upon them for the reception of the longitudinal sills, substantially as set forth.

12. The combination, with the end sill and transom-beam, of draw-frames, each of which is made in one piece with flanges for stiffening the metal and openings for receiving the ends of the followers, and bolts for connecting the ends of the draw-frame to the end sill and transom-beam, respectively, substantially as set forth.

13. The cast-metal draw-frame P, made in one piece, having flanges to strengthen the metal, openings for the attaching-bolts, and an opening for the followers of the draw-bar, substantially as set forth.



14. The cast-metal end sill formed as a hollow box, with openings to lessen the weight and tapering toward the ends, substantially as set forth.

15. The follower for the draw-bar spring, made of malleable cast-iron in one piece and having front and back plates and connecting plates or flanges, so as to form a hollow box with an opening through it for the draw-bolt, substantially as specified.

16. The compound clip-pieces 50 and 51, adapted to connect the step and tube, substantially as set forth.

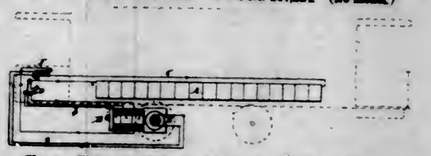
17. The end sill formed of cast metal as a hollow box with openings, in combination with the brake-shaft passing through the top of the sill, and having its lower end within a socket in the lower part of the sill, substantially as set forth.

385,178. APPARATUS FOR PITCHING BARRELS. LOUIS HAGENBUCHLER and OTTO HAGENBUCHLER, Philadelphia, Pa. Filed Nov. 18, 1887. Serial No. 255,462. (No model.)

Claim.—1. In a device for pitching barrels, a furnace having a steam-injection pipe connected to a superheating-jacket, in combination with an air-pipe connected to a second superheating-jacket, the air-pipe surrounding the injection-pipe and connected to the base of the furnace at a point below the bed of the fire, substantially as described.

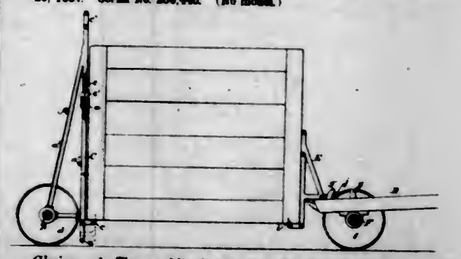
2. In a device for pitching barrels, two superheating-jackets arranged in close proximity to a furnace, in combination with a steam-injecting pipe and an air-pipe, each connected to one of said superheating-jackets, and so arranged that the admission of steam through the injector forces intermingled superheated steam and air through the furnace, substantially as described.

3. A barrel-pitching apparatus consisting of a furnace with hood having a nozzle, an air-heating chamber with air-pipe leading therefrom into the base of the furnace, and a steam-pipe leading into said air-pipe, said parts being combined substantially as described.



4. In a barrel-pitching apparatus, the combination of an air-tube connected to the base of a furnace with a steam-injector located within said air-tube, the air-tube and the injector being connected, respectively, to superheating chambers and jackets, substantially as described.

385,179. MUG. ZACHARY T. HALL, Philadelphia, Pa. Filed Dec 31, 1887. Serial No. 260,476. (Model.)



Claim.—A metallic mug consisting of outer and inner walls, the outer wall being embossed or chased and the inner wall plain, the inner wall having a bead at the top inclosing the top of the outer wall, and a bottom with circumferential flange inclosing the base of both walls, substantially as described.

385,180. ELECTRIC RAILWAY. RUDOLPH M. HUNTER, Philadelphia, Pa. Filed Mar. 15, 1888. Serial No. 267,294. (No model.)

Claim.—The method of propelling and controlling an electrically-propelled vehicle supplied with motive power from secondary batteries carried by the vehicle, which consists in coupling up the cells of the battery or batteries in fixed relation, supplying the motor or motors propelling the vehicle with the full current of the battery, and varying the speed and power of the motor or motors by coupling up the coils of the motor or motors in different relations to vary their internal resistance.

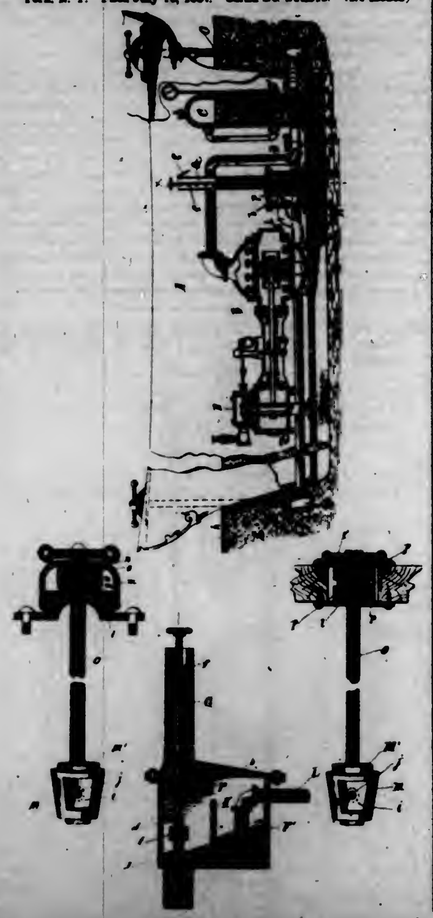
385,181. TRUCK. MAURICE HUNTLY, Philadelphia, Pa. Filed Nov. 29, 1887. Serial No. 256,440. (No model.)

Claim.—1. The combination, in a truck, of a wheeled support consisting of a frame-work having a portion adapted to pass under the object to be carried and another portion adapted to press against one end of the object, with a lever mounted on wheels and with a frame adapted to be supported by said lever, and having a portion adapted to bear against the other end of the object to be carried, and a portion passing under said object, so that on raising the lever the object is supported by the two end frames, substantially as specified.

2. The combination, in a truck, of the frame A and wheels therefor, with claws C passing under the object to be carried, with a frame, E, at the opposite end, having claws *i*, with a carrying-truck for this frame E, substantially as described.

3. The combination of the frame A, with the frame E and its carrying-truck B, and a roller, C, sliding on the frame A, and having claws which engage with the object to be carried, substantially as described.

4. The combination of the frame A, carrying-wheels therefor, with a frame, C, adapted to slide on said frame E, and provided at one end with a threaded bolt, which passes through a portion of the frame A, and a nut by which the frame C is hung upon the frame A, substantially as described.



5. The combination of the frame, the rear carrying-frame, A, having wheels and having an eye, *c'*, with the front truck, B, having wheels, and a pin over which the eye of the rear truck passes when the two are connected, substantially as described.

6. The combination of the wheeled rear frame, A, having an eye, *c'*, with a wheeled front truck, B, having a pivot-pin, with a platform, G, having a portion adapted to pass over the said pivot-pin, and a pin adapted to pass through the eye *c'* in the rear truck, substantially as specified.

7. The combination of the front truck, the wheels, the shaft, a crow-bar, *b*, forming the handle for said truck, and a pivot-pin thereon, with a pike, *b'*, substantially as described.

8. The combination of the rear truck, A, mounted on wheels, having a portion adapted to pass under the object to be carried, with a front truck, and a frame, E, thereon, having a portion adapted to pass under the object to be carried, with a cord or chain passing from the front frame, E, to a windlass on the frame A, substantially as described.

385,182. MARINE PROPULSION. WALTER M. JAMESON, New York, N. Y. Filed July 16, 1887. Serial No. 244,519. (No model.)

Claim.—1. In an apparatus for propelling or maneuvering vessels, the combination, with a steam-pump in which the steam-piston is of greater area than the pump-piston, of a receiver connected with the pump and adapted to contain air or other elastic material and the pumped water stored therein under dynamic compression, and submerged outlets (one or more) in communication with said receiver, substantially as set forth.

2. In an apparatus for propelling or maneuvering vessels, the combination, with steam-pistons of different areas and pump-pistons connected therewith, of a submerged water-discharge orifice, for the purpose of propelling or maneuvering a vessel, substantially as set forth.

3. The combination, with the differential pistons of a compound engine and a pump-piston of less area than the high-pressure piston of the engine, of a receiver adapted to contain air or other elastic material, in which the pumped water is stored under dynamic compression, and submerged water-discharging orifices connected therewith, the latter being of less area than the pump-piston to create and maintain a greater pressure to the square inch at the submerged outlets than the initial boiler-pressure, for the purpose of propelling or maneuvering a vessel, substantially as set forth.

4. In apparatus for propelling or maneuvering a vessel, the combination, with a water-forcing device and a submerged discharge-orifice connected therewith, an adjustable discharge-plug, and a pipe leading from the water-forcing device to the discharge-plug, of a water-supply tank having submerged inlet-ports and a pipe connecting the supply-tank and water-forcing device, substantially as set forth.

5. In apparatus for propelling or maneuvering a vessel, the combination, with a water-forcing device and a submerged discharge, of a water-supply tank having submerged inlet-ports and an air and water separating chamber, and a suction-pipe leading from the tank to the water-forcing device, substantially as set forth.

6. In apparatus for propelling or maneuvering a vessel, the combination, with a water-forcing device, a submerged discharge, and a pipe connecting the water-forcing device and submerged discharge, of a chambered water-supply tank having submerged inlet-ports, valves for controlling the ports, elevated air-receiving and discharge stand-pipes, and a suction-pipe leading from one chamber of the tank to the water-forcing device, substantially as set forth.

7. In apparatus for propelling or maneuvering a vessel, the combination, with a water-receiver containing air or other elastic medium and a forcing device for supplying said receiver with water, of a water-supply tank, the latter having submerged inlet-ports, a pipe connecting the supply-tank and water-forcing device, and submerged water-discharge pipe or pipes leading from the receiver, substantially as set forth.

8. In apparatus for propelling or maneuvering a vessel, the combination, with a water-receiver containing air or other elastic medium and a forcing device for supplying said receiver, of a water-supply tank having submerged inlet-ports and an air-receiving chamber, a pipe connecting the supply-tank and water-forcing device, and submerged water-discharge orifice or orifices leading from the water-receiver, substantially as set forth.

9. In apparatus for propelling or maneuvering a vessel, the combination, with a water-receiver containing air or other elastic medium and a forcing device for supplying water to said receiver, of a water-supply tank having submerged water-inlet ports, a pipe connecting the supply-tank and water-forcing device, valves for controlling the ports in said submerged inlet-ports, air-receiving stand-pipes leading upwardly from the water-supply tank, covers for said stand, and submerged water-discharge orifice or orifices leading from the water-receiver, substantially as set forth.

10. In apparatus for propelling or maneuvering a vessel, the combination, with a water-receiver containing air or other elastic medium and a forcing device for supplying said receiver, of a water-supply tank having submerged inlet-ports, valves for controlling the ports, and a partition extending transversely of the tank, pipes connecting the water-forcing device and supply-tank, the ends of the pipe within the tank being below the top of the partition on the opposite side from the inlet-ports, and submerged water-discharge orifice or orifices leading from the receiver, substantially as set forth.

11. In apparatus for propelling and maneuvering a vessel, the combination, with a water and air receiving tank having water-inlet ports and air-chamber, of a water-forcing device having a submerged outlet, and a pipe connecting the water-forcing device and tank, substantially as set forth.

12. In a vessel, a water and air receiving tank having inlet-ports, valves for controlling the ports, air-receiving stand-pipes extending above the tank and in communication therewith, and covers for the stand-pipes, substantially as set forth.

13. In apparatus for propelling or maneuvering a vessel, the combination, with a water-forcing device, a tank having submerged inlet-ports, and a pipe connecting the tank and water-forcing device, of a discharge-pipe leading from the water-forcing device, and means for

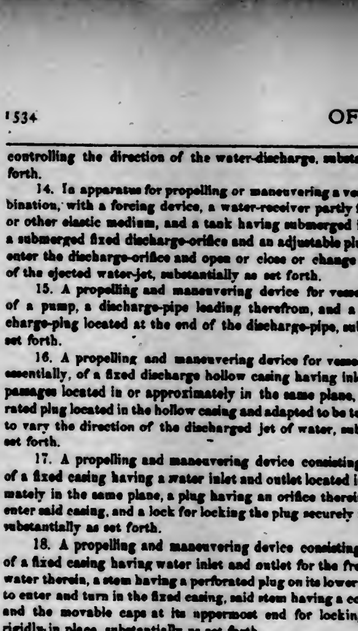
controlling the direction of the water-discharge, substantially as set forth.

14. In apparatus for propelling or maneuvering a vessel, the combination, with a forcing device, a water-receiver partly filled with air or other elastic medium, and a tank having submerged inlet-ports, of a submerged fixed discharge-orifice and an adjustable plug adapted to enter the discharge-orifice and open or close or change the direction of the ejected water-jet, substantially as set forth.

15. A propelling and maneuvering device for vessels, consisting of a pump, a discharge-pipe leading therefrom, and a movable discharge-plug located at the end of the discharge-pipe, substantially as set forth.

16. A propelling and maneuvering device for vessels, consisting, essentially, of a fixed discharge hollow casing having inlet and outlet passages located in or approximately in the same plane, and a perforated plug located in the hollow casing and adapted to be turned therein to vary the direction of the discharged jet of water, substantially as set forth.

17. A propelling and maneuvering device consisting, essentially, of a fixed casing having a water inlet and outlet located in or approximately in the same plane, a plug having an orifice therein adapted to enter said casing, and a lock for locking the plug securely in the casing, substantially as set forth.



18. A propelling and maneuvering device consisting, essentially, of a fixed casing having water inlet and outlet for the free passage of water therein, a stem having a perforated plug on its lower end adapted to enter and turn in the fixed casing, said stem having a collar thereon and the movable cape at its uppermost end for locking the collar rigidly in place, substantially as set forth.

19. In a vessel, the combination, with a water-forcing device, of submerged discharge-outlets for elevating the vessel to the surface of the water, and pipes connecting the outlets with the water-forcing device, substantially as set forth.

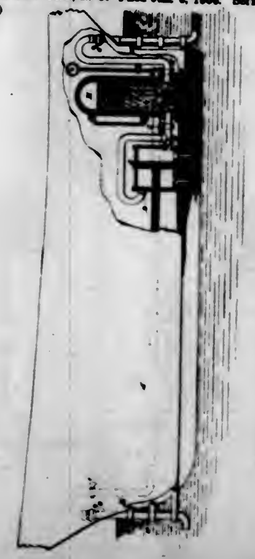
20. In a vessel, the combination, with a water-forcing device, of discharge-outlets at one or both ends of the boat, which direct the discharged water upwardly, and pipes connecting the outlets with the water-forcing device, substantially as set forth.

21. In a vessel, the combination, with a water-forcing device and submerged outlets at the stern for propelling the vessel, of the double discharge-outlets for directing the discharged water up or down, and pipes connecting the water-forcing device with the several outlets, substantially as set forth.

385,183. MARINE PROPULSION. WALTER M. JACKSON, New York, N. Y. Filed Dec. 16, 1886. Renewed Dec. 15, 1887. Serial No. 258,015. (No model.)

Claim.—1. The combination of a suitable pump or water-forcing device having water-inlet pipe and outlet or outlets, the latter being of smaller capacity than the inlet, and water-storage tank or reservoir adapted to contain air or other elastic medium, the said tank being located between the pump or water-forcing device and the propelling or guiding outlet or outlets.

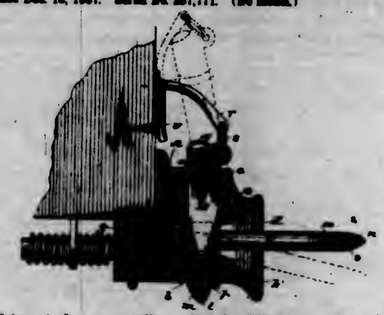
2. In a device for propelling or handling a floating vessel, the combination of a pump or water-forcing device having a water-inlet, an outlet-pipe the submerged discharge end of which is of smaller capacity than the inlet, a tank or receiver adapted to contain air or other elastic medium and located between the pump and discharge-pipe, and valves for cutting off the water to and from the tank, substantially as set forth.



3. In a device for propelling and handling a floating vessel, the combination, with a tank or reservoir provided with an air-cushion, a pump or other device for forcing water into said tank or reservoir, and an inlet-pipe leading to said tank, of a water-discharge pipe connected to said tank or reservoir at or near the bottom thereof, the submerged outlet of said discharge-pipe being of smaller capacity than the inlet, substantially as set forth.

4. In a device for guiding or steering floating vessels, the combination, with a pump having an inlet, of a storage-tank into which the water is forced under a column of air or other elastic medium, a pipe leading from said storage-tank, and a movable discharge-pipe communicating with said tank and having a submerged discharge-orifice of less capacity than the water-inlet, substantially as set forth.

5. In a device for propelling and guiding a floating vessel, the combination, with a pump or water-forcing device and inlet-pipe leading thereto, of a storage-tank into which the water is forced under a column of air, a discharge-pipe a section of which is adapted to rotate and thus change the direction of the issuing jet of water, the submerged outlet of said rotating section being of smaller capacity than the water-inlet, and valves for cutting off the water to and from the tank, substantially as set forth.



6. The herein-described apparatus for propelling or maneuvering a vessel, consisting, first, in a suitable boiler; second, in any suitable water-forcing device; third, in the employment of any suitable means for taking the water in which the vessel is wholly or partially submerged through the vessel and into said water-forcing device, and, fourth, in discharging said water by means of suitable conduits connecting with said water-forcing device, said conduits having their discharge-orifices opening into the water in which the vessel is wholly or partially submerged at a greater pressure to the square inch than that exerted to the square inch by the boiler, for the purpose of creating aqueous molecular confusion or the impact of water particles in the water in which the vessel is wholly or partially submerged, establishing intense reactionary resistance in said water and attaining a greater percentage of the energy of the boiler for propelling and maneuvering vessels than has heretofore been secured, substantially as specified.

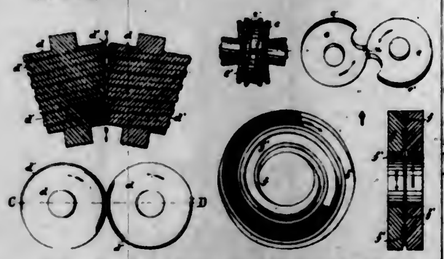
385,184. METHOD OF MARINE PROPULSION. WALTER M. JACKSON, New York, N. Y. Filed Jan. 6, 1888. Serial No. 259,953. (No model.)

Claim.—Claim.—The herein-described method of marine propulsion, which consists in developing a pressure exceeding the boiler-pressure by means located between the boiler and water-exit, subjecting water received into the vessel to such increased pressure, and then discharging said water in the form of one or more submerged jets against the water of flotation.

385,185. CAR-COUPLING. EDWARD L. KEELER, Beaver Falls, Pa. Filed Dec. 13, 1887. Serial No. 257,771. (No model.)

Claim.—1. In a car-coupling, a draw-head having a vertical rectangular slot, one of the walls of which is inclined and provided with two supports for a coupling-pin, in combination with a pin having a notch or seat in its lower end, and an operating-shaft upon which said pin is suspended, substantially as described.

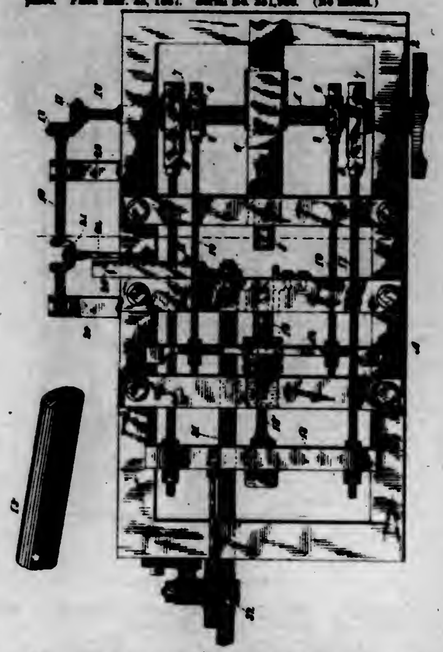
2. In a car-coupling, a draw-head having a chamber in the rear portion thereof, provided with a rearwardly-inclined upper wall, and a projection across the front end of said chamber, in combination with a link having its ends curved, substantially as shown, and for the purpose described.



3. In a car-coupling, a draw-head having a vertical right-angular slot and a transverse support, in combination with a pin having a projection on its end provided with front and rear curved surfaces and a notch or seat, and a link having double-curved surfaces on its ends, substantially as described.

4. In a car-coupling, a draw-head provided with a vertical slot having an inclined wall, a transverse shaft secured to the car-body and provided with an arm, and a coupling-pin secured to said arm by a ring or chain on one side of its median line, substantially as described.

5. A coupling-pin weighted on one side of its median line, in combination with an operating-arm to which the pin is attached by a ring or chain on the opposite side of said line, a slotted draw-head, and a link, substantially as described.



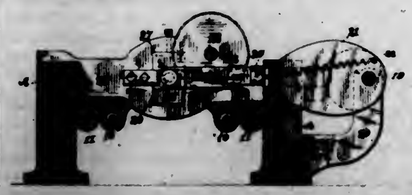
6. In a car-coupling, a slotted draw-head having two transverse supports, a link, and a pin, in combination with an arm of a rock-shaft, the pin being attached to the arm on one side of its median line and supported to swing rearward under said arm at its upper end and forward at its lower end to rest upon said support, substantially as described.

385,186. DIE FOR ROLLING ARTICLES OF METAL. DANIEL R. KENFIELD, Boston, Mass. Filed Feb. 6, 1886. Serial No. 262,360. (No model.)

Claim.—Dies for roll-forging metal articles having circular cross-sectional area from metal blanks separated from the main rod or bar, said dies having their forming, reducing, and spreading surfaces entirely within working-grooves running obliquely to the line of rotation of the metal article being rolled therein, or to the line of movement of the dies proper, substantially as herein specified, and for the purpose set forth.

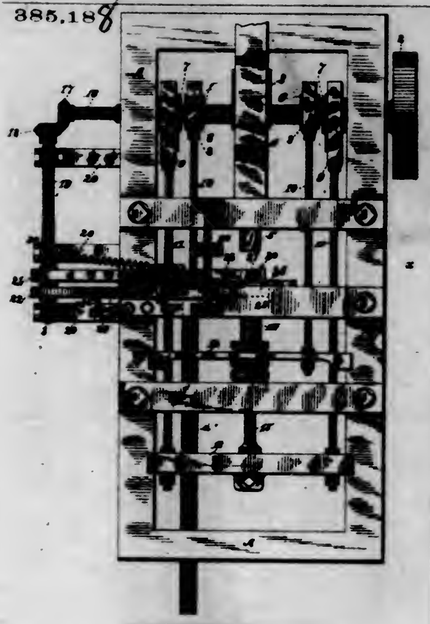
385,187. NUT-MACHINE. FREDERICK LACKNER, Pittsburg, Pa., assignor to Thomas Healy, Edwin Bindley, and John Bindley, all of same place. Filed Mar. 22, 1887. Serial No. 231,969. (No model.)

Claim.—1. In a nut-machine, the combination of a cutter, adapted to sever the section or blank and transfer it to a position in front of the nut-forming matrix, and a crank having a loose connection with the cutter, said parts being so constructed and combined as to permit of a stop in the movement of the cutter at the opposite limits of its stroke, substantially as set forth.



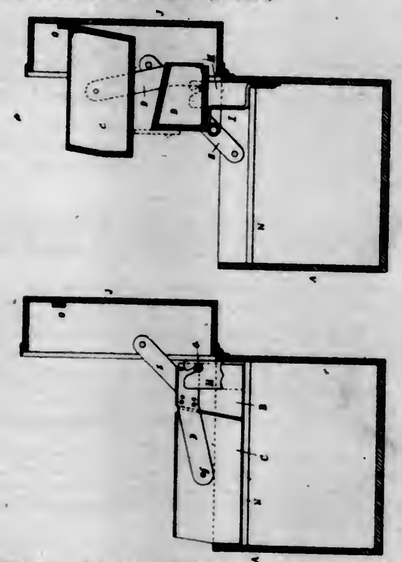
2. In a nut-machine, the combination of a nut-forming matrix, oppositely-acting compressing-dies, and a punch having its entering point or edge eccentric to the axis, but within the perimeter of the punch, substantially as set forth.

385,188. NUT-MACHINE. FREDERICK LACKNER, Pittsburg, Pa., assignor to Thomas Healy, Edwin Bindley, and John Bindley, all of same place. Filed Mar. 22, 1887. Renewed May 7, 1888. Serial No. 273,126. (No model.)



Claim.—1. In a machine for forming polygonal nuts, the combination of nut-shaping mechanism, consisting of a matrix, compressing-die, and a perforating-punch, a saw, and mechanism for feeding the bar to the the saw and the severed blank to the nut-shaping mechanism, substantially as set forth.

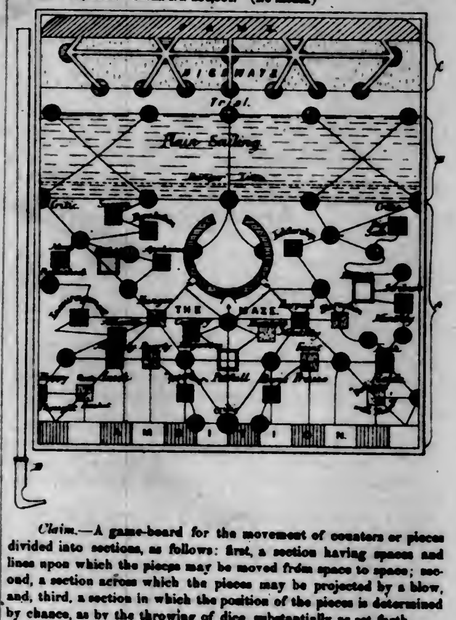
2. In a machine for forming polygonal nuts, the combination of nut-shaping mechanism, consisting of a matrix, compressing-dies, and a perforating-punch, a saw, and slides for feeding the bar to the saw and the severed blank to the nut-shaping mechanism, substantially as set forth.



3. In a machine for forming polygonal nuts, the combination of nut-shaping mechanism, consisting of a matrix, compressing-dies, and a perforating-punch, and a saw for dividing a bar into sections or blanks for subsequent shaping by the nut-shaping mechanism, substantially as set forth.

385,188

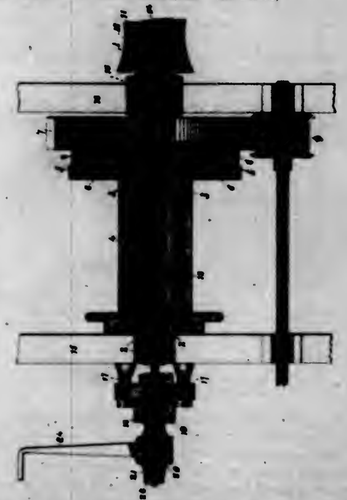
385,189. TRUNK. WILLIAM J. LARKE, Brooklyn, N. Y. Filed May 3, 1888. Serial No. 273,243. (No model.)



Claim.—1. In a trunk, the combination of two movable tray-sections, end arms fixed to one section and pivoted to the other section, trunnions on the ends of one section, and bearings for said trunnions on the trunk-body, substantially as and for the purpose described.

2. In a trunk, the combination of two movable tray-sections, end arms fixed to the rear section and pivoted to the front section, trunnions on the ends of the rear section, and bearings for said trunnions on the trunk-body, substantially as and for the purpose described.

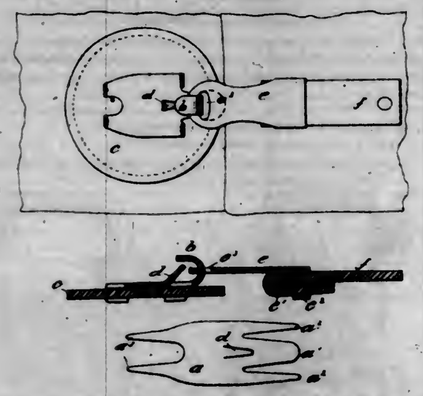
3. In a trunk, the combination of two movable tray-sections, end arms fixed to the rear section and pivoted to the front section, trunnions on the ends of the rear section, bearings for said trunnions on the trunk-body, and a swinging bracket on the trunk-body, forming a support for the rear section, substantially as and for the purpose described.



4. In a trunk, the combination of two movable tray-sections, end arms fixed to the rear section and pivoted to the front section, trunnions on the ends of the rear section, bearings for said trunnions on the trunk-body, a swinging bracket on the trunk-body, forming a support for the rear section, and a stop on the trunk-cover to engage the front section, substantially as and for the purpose described.

385,190. GAME. GEORGE P. LATHROP, New London, Conn. Filed Nov. 28, 1887. Serial No. 256,301. (No model.)

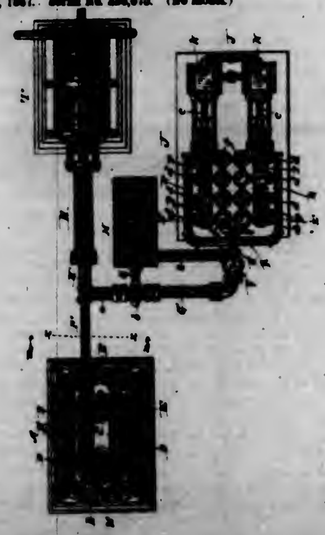
Claim.—A game-board for the movement of counters or pieces divided into sections, as follows: first, a section having spaces and lines upon which the pieces may be moved from space to space; second, a section across which the pieces may be projected by a blow, and, third, a section in which the position of the pieces is determined by chance, as by the throwing of dice, substantially as set forth.



385,191. FRICTION-DRUM. HUGH J. MCKNOWN, Newport, Ky. Filed Feb. 7, 1888. Serial No. 263,310. (No model.)

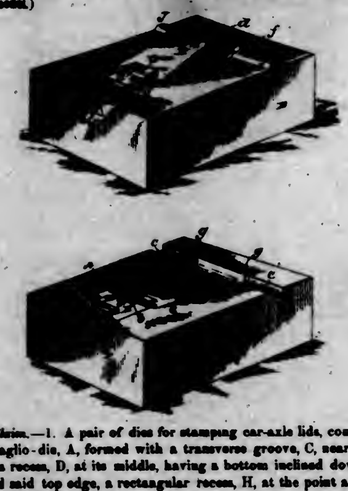
Claim.—1. In combination with the engaging gear-wheel and the friction-drum mounted on a hollow shaft supported in suitable frames, a tubular screw-threaded piece, a rod fixed to one of the supporting-frames and screw-threaded to receive the said piece, and a rod passing loosely through the tubular piece and the hollow shaft and provided with an engaging device, substantially as shown and described.

2. In combination with the gear-wheel 7, drum 4, provided with friction-surfaces, hollow shaft 1, which receives the wheel and drum, and frames 15 and 16, in which shaft 1 is mounted, studs 17 on frame 15, nut 18, fitted on said studs, tubular piece 20, screwed into said nut, handle 24, fitted on the former, and rod 13, having nuts 21 and 23, wherewith piece 20 is adapted to engage and move rod 13 longitudinally, said rod being provided with an enlargement, 14, adapted to engage the hub of wheel 7 and bring the wheel 7 and friction-surfaces of the drum into contact, substantially as set forth.



385,192. CLASP. JOSEPH MERRIAM, Middletown, Conn. Filed Apr. 9, 1887. Serial No. 234,204. (No model.)

Claim.—1. The improved base-plate blank made of thin metal cut or stamped to shape with the forward-projecting parts, a' a^2, and the rearward-projecting spurs, a^3, and the tongue-piece cut free from the base-piece on all but one side, all substantially as described, and for the purpose set forth.



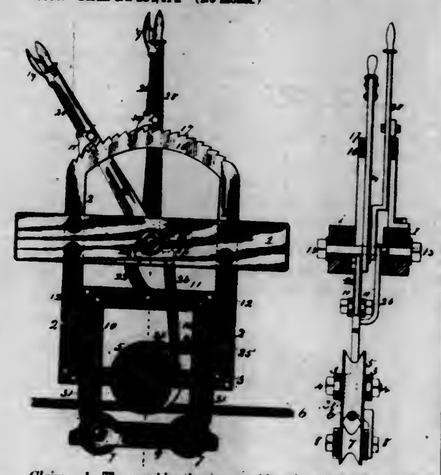
2. In combination with the attaching-disk c, the base-plate having on its front edge the hook b, and the integral rigid tongue d, extending forward at an angle with the base-plate and with its front end lying close to the point of the hook, and the loop-base e, with the integral strap-loop and stop and the slot e^1, and the attaching-strap f, all substantially as described.

385,193. COTTON-PRESS. LEWIS MILLER, Philadelphia, Pa. Filed Feb 8, 1887. Serial No. 226,675. (No model.)

Claim.—The combination, with the hydraulic press, of the hydraulic ram T, connected directly with the leader-pipe of the said press, the primary forcing-pump J, consisting, essentially, of the engines K K, provided with pistons, which operate in pumping-cylinders P, the said cylinders P communicating with the outlet valve-boxes d and the inlet valve-boxes f, the outlet-boxes in turn communicating, by means of the pipe R, with the pipe R', and the inlet-boxes with a pipe, c, the supply-tank connected to the inlet-pipe c of this forcing-pump, the pipe G', connecting the outlet-pipe R' of this pump with the leader-pipe of the press, the automatic check-valve V in the pipe G', adjacent to the outlet-pipe R', and adapted to close automatically when the primary pump reaches its maximum pressure, to protect the valves of the pump from back-pressure, the laterally-enlarged valve-box b, inserted in the pipe G', between the leader-pipe of the press and the check-valve V, and provided with an outlet in its under side, the vertically-working balance-valve b', closing the lower outlet in the valve-box b and passing through the center of the said enlarged valve-box, so as not to obstruct the passage of the pressing-liquid therethrough, and the return-pipe G, connecting the outlet in the valve-box b with the supply-tank H, all arranged as and for the purpose specified.

385,194. DIE FOR MAKING CAR-AXLE-BOX LIDS. GEORGE W. MORRIS, Pittsburg, Pa. Filed Apr. 18, 1888. Serial No. 271,157. (No model.)

Claim.—1. A pair of dies for stamping car-axle lids, comprising an intaglio-die, A, formed with a transverse groove, C, near its top edge, a recess, D, at its middle, having a bottom inclined downward toward said top edge, a rectangular recess, H, at the point at which said inclined bottom merges into the face of said die, and a projection or rib, I, upon the face of the die between said recess H and the front edge of said die, and a relief-die, B, formed with a transverse rib, J, corresponding to and registering with said groove C in the intaglio-die, an inclined bulge, K, corresponding to and registering with said inclined recess D in the said die, a rectangular block or projection, N corresponding to and registering with said rectangular recess H in said die, and a groove or recess, O, corresponding to and registering with said projection or rib I of said die, substantially as described, for the purpose specified.



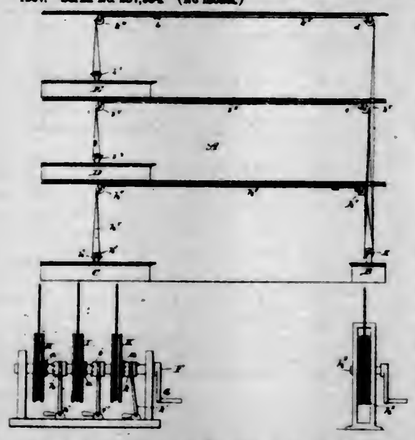
2. The die herein described, consisting of the two flat-faced parts A and B, the part A having a central-longitudinal recess, D F, intersected at one end by transverse surface grooves C C and closed at its other end by a removable part, E, having a surface, C, inclining downward to a feather-edge coincident with the bottom of said recess D F, a surface recess, H, having a shearing-edge, a, its bottom terminating in the inclined surface G and a surface projection, I, the other die part, B, having the inclined surface bulge K, a transverse rib, J, intersecting the inclined bulge at its end of greatest surface projection, a recess, M, intersecting the bulge at its feather-edge, closed by a removable part, L, having a surface projection, N, intersecting the feather-edge of said bulge and having a shearing-edge, b, and the groove or depression O, substantially as described, for the purpose specified.

3. The combination of the intaglio-die A, which is formed with the transverse groove C, inclined recess D, and dovetailed recess F, and the relief-die B, which is formed with the transverse rib J, the inclined swell or bulge K, and the dovetailed recess M, with the dovetailed block E, which is formed with the inclined side G, rectangular recess H, and transverse rectangular rib I, and the dovetailed block L, which is formed with the rectangular projection N and the trans-

verse rectangular groove or recess O, substantially as and for the purpose described.

385,195. CABLE-GRIP.

FREDERICK H. MOSES, St. Louis, Mo., assignor of one-half to Edward M. STAFF, same place. Filed Apr. 11, 1887. Serial No. 234,414. (No model.)

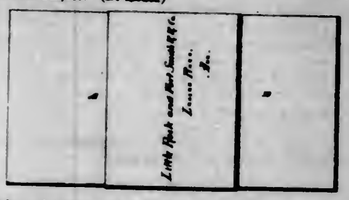


Claim.—1. The combination, in a cable-grip, of a pulley against which the upper side of the cable bears, a break adapted to lock said pulley, and a movable frame carrying pulleys adapted to bear against the under side of the pulley at each side of the top pulley, substantially as and for the purpose set forth.

2. The combination, in a cable-grip, of a pulley adapted to bear upon the top of the cable, and a vertically-sliding frame carrying pulleys adapted to bear against the under side of the cable, and inclines on the frame adapted to push the cable aside as the sliding frame is moved downward, substantially as and for the purpose set forth.

3. The combination, in a cable-grip, of a stationary frame carrying a pulley against which the upper side of the cable bears, a brake adapted to bear against the pulley and operated by a hand-lever, and carrying pulleys adapted to press against the under side of the cable and force it against the upper pulley, for the purpose set forth.

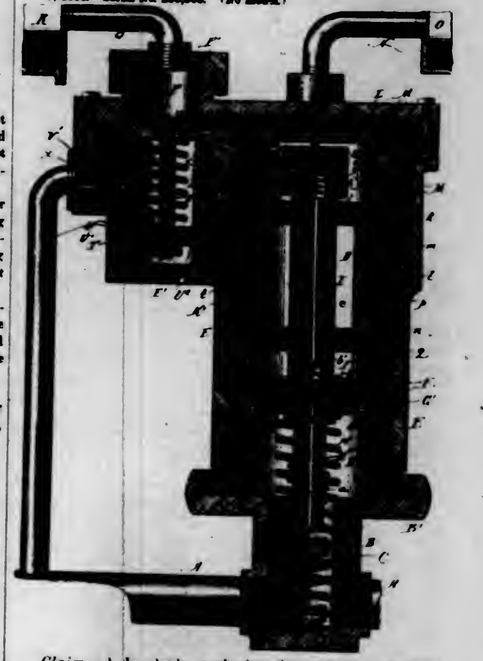
385,196. CASH-CARRIER.



NELSON NEWMAN, Springfield, assignor of one-half to George A. Sanders, Sangamon County, Ill. Filed Dec. 15, 1887. Serial No. 257,984. (No model.)

Claim.—In a cash-carrier, the combination of the endless traveling cord, the car or case suspended therefrom and having the pointed end, the guide-pulleys over which the cord passes, and the finger-fingers *d*, attached to the axles of the pulleys, adapted to engage the pointed end of the car, and thereby swing the same to one side and cause it to clear the guide-pulleys, substantially as described.

385,197. RETURN-PACKET FOR THE TRANSMISSION OF PAPERS, &c.



WILLIAM R. HOLLEY, Conway, Ark. Filed July 7, 1887. Serial No. 243,703. (No model.)

Claim.—A return-packet for the transmission of papers, &c., consisting, substantially as before set forth, of a primary unsealed wrapper to inclose the papers transmitted and a secondary wrapper for encircling the primary wrapper, provided on its inner face with a gummed overlapping end, and also with a small gummed patch at a point remote from said gummed overlapping end.

385,198. AIR-BRAKE.

HARVEY S. PARR, Chicago, Ill. Filed Jan. 3, 1888. Serial No. 259,568. (No model.)

Claim.—1. In a brake mechanism, the combination of a train-pipe, a car-reservoir, a brake-cylinder, a chamber having communication with the train-pipe, the car-reservoir, and the brake-cylinder, two slide-valves located and operating in said chamber, a secondary chamber having communication with the train-pipe, brake-cylinder, and car-reservoir, a piston or movable wall located and operating in said chamber, and a valve connected with said piston or movable wall and held seated by air-pressure from the train-pipe on the piston and opened by the admission of air-pressure from the car-reservoir to overcome the train-pipe pressure on the piston for the air-pressure from the train-pipe to act on the valve, substantially as described.

2. In a brake mechanism, the combination of a train-pipe, a car-reservoir, a brake-cylinder, a chamber communicating with the car-reservoir, brake-cylinder, and train-pipe, a second chamber communicating with the train-pipe, brake-cylinder, and car-reservoir through the first chamber, a movable piston or wall in the second chamber controlling a valve between the train-pipe and brake-cylinder, and two slide-valves located in the first chamber and operated by a piston in said chamber, one of said valves at the initial travel of the piston opening a port between the car-reservoir and the brake-cylinder, and the further travel of the same valve opening a communication between the brake-cylinder and atmosphere, and a still further travel of the same valve closing such communication and opening a communication through the other valve between the car-reservoir and the second chamber containing the movable piston or wall to overcome the train-pipe pressure on the piston and open direct communication between the train-pipe and brake-cylinder, substantially as set forth.

3. In a brake mechanism, the combination of a slide-valve, a piston connected with the said valve, a chamber communicating with a car-reservoir and a brake-cylinder, a second chamber connected with the car-reservoir through the first chamber and communicating with the train-pipe and brake-cylinder, a movable wall or piston in the said second chamber, a valve connected with said movable wall or piston and controlling communication between the train-pipe and brake-cylinder, and a second slide-valve operated by the piston of the first slide-valve, whereby the first slide-valve controls the communication between the car-reservoir and brake-cylinder and the brake-cylinder and atmosphere, and the second slide-valve controls the communication between the train-pipe and the brake-cylinder direct by overcoming the train-pipe pressure on the piston in the second chamber, substantially as specified.

4. In a brake mechanism, the combination of a train-pipe, a car-reservoir, a brake-cylinder, two slide-valves, a secondary valve controlled by a piston moving in a chamber, and a piston carried by a hollow stem having at one end a valve seated downward and at the other end a valve seated upward, each held seated by a spring and operating, when said piston is at its normal position, to have the upper valve unseated and the lower valve lifted to permit air to pass from the train-pipe through the piston and hollow stem to the car-reservoir, and with the preliminary travel of the piston to have the upper valve seat and prevent the passage of air from the train-pipe to the car-reservoir and the lower valve seat and prevent the passage of air from the car-reservoir to the train-pipe, substantially as specified.

5. In a brake mechanism, the combination of a train-pipe, a car-reservoir, a chamber communicating with the train-pipe and car-reservoir, a brake-cylinder communicating with said chamber, a slide-valve in said chamber provided with ports controlling ports and passages in the chamber connecting the car-reservoir, brake-cylinder, and atmosphere, a second chamber connected with the car-reservoir through the first chamber, a slide-valve in the first chamber controlling communication between the two chambers, a piston or movable wall in the second chamber, a valve connected with said piston and controlling the communication direct between the train-pipe and brake-cylinder, a hollow stem connecting the slide-valves with the piston, valves for the said stem seated upward and downward, and springs to return the piston for the slide-valves to its normal position, substantially as set forth, and for the purposes specified.

6. In a brake mechanism, the combination of a train-pipe, a car-reservoir, a chamber provided with ports and passages connecting the car-reservoir and brake-cylinder and the brake-cylinder and atmosphere, a piston in said chamber, a slide-valve attached to said piston and provided with a port and recess to coact with the ports and passages of the chamber, and springs for returning the piston, whereby the first movement of the slide-valve opens a port for the car-reservoir and brake-cylinder by lowering the pressure in the train-pipe, the equalization of the pressure through the spring restores the piston and slide-valve to normal position, holding the pressure on the brake-cylinder and refilling the car-reservoir through the stem of the piston from the train-pipe, a further reduction of the train-pipe pressure moving the valve to open the ports for discharging the brake-cylinder to the atmosphere, a further reduction of the train-pipe pressure closing such port, and a further reduction of the train-pipe pressure moving the valve to open a port for increased pressure between the car-reservoir and brake-cylinder, and a quick restoration of the train-pipe pressure returning the piston and valve instantly to normal position, holding the pressure on the brake-cylinder, substantially as set forth, and for the purposes specified.

7. In a brake mechanism, the combination of a train-pipe, a car-reservoir, a brake-cylinder, a chamber connected with the train-pipe car-reservoir, and brake-cylinder, a piston, and two slide-valves located in said chamber, one of said slide-valves controlling the connection between the car-reservoir and brake-cylinder, and the other of said slide-valves controlling a port from its chamber to a second chamber, a piston in said second chamber, and a valve attached to said piston and controlling the supply from the train-pipe to the brake-cylinder, said valve being closed by train-pipe pressure on the piston and raised by train-pipe pressure on the valve when said pressure on the piston is overcome by air admitted from the car-reservoir, substantially as set forth, and for the purposes specified.

8. In a brake mechanism, the combination of the cap L, passage M, passage M', and ports *k m n q*, with slide-valve K, port *o*, and recess *p*, substantially as and for the purposes specified.

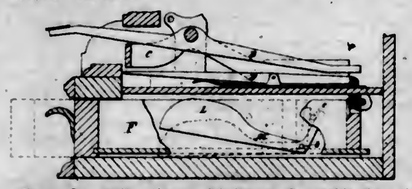
9. In a brake mechanism, the combination of a piston or movable wall, a stem, G, having a passage, *e*, and stem I, having a passage, *c*, with the valve *b*, valve *i*, and cap L, substantially as and for the purpose specified.

10. In a brake mechanism, the combination of the slide-valve K', having port *r* and recess *s*, with the chamber S, ports *t* and *u*, a piston or movable wall, valve *w*, and pipe V, substantially as and for the purpose specified.

11. In a brake mechanism, the combination of the slide-valve K', having the port *i* and recess *s*, with the chamber S, ports *t* and *u*, a piston or movable wall, a valve, *w*, a connecting-pipe, V, and a valve, *x*, substantially as and for the purpose specified.

12. The chamber D, connecting-pipe N, car-reservoir O, slide-valve K', having a port, *r*, and a piston or movable wall in the chamber D, in combination with the chamber S, port *u*, a movable wall or piston in the chamber S controlling a valve, *w*, and a valve, *x*, for operating the brake in case of parting of the train-pipe, substantially as specified.

13. In a brake mechanism, the combination of a chamber or casing, S, having connection with a brake-cylinder, a valve, *w*, which opens toward the brake-cylinder and controls communication between the chamber S and the brake-cylinder, a piston or diaphragm, U', a piston-rod, U, and a pipe, V, communicating at one end with the chamber S and at the other end with a train-pipe, a car-reservoir, a chamber, D, and a port, *u*, in the wall of the chamber S, through which air can be admitted to the under side of the piston, substantially as and for the purpose specified.



14. In a brake mechanism, the combination of a train-pipe, a car-reservoir, a brake-cylinder, a valve-chamber, D, a slide-valve in said chamber D, a chamber, S, a piston, U', and a valve, *w*, held seated by air on the piston U' and actuated by air-pressure from the train-pipe when by the admission of air from the car-reservoir to the under side of the piston the effect of the air from the train-pipe upon the upper side of the piston has been neutralized, substantially as specified.

15. In a brake mechanism, the combination of a train-pipe, a car-reservoir, a brake-cylinder, a valve-chamber, D, a slide-valve in said chamber operated by the piston I', a port, *m*, opened and closed by the preliminary travel of the piston, ports *n*, recess *p*, and port *q*, for opening communication between the brake-cylinder and atmosphere, ports *r* and *u* to open communication between the chamber D and the chamber S, passage *s* and port *t* to open communication between the chamber S and the atmosphere, and port *k* to open communication between the car-reservoir and the brake-cylinder, substantially as and for the purpose specified.

16. In a brake mechanism, a valve-chamber, D, provided with ports *k*, *m*, *n*, *q*, *r*, and *t*, a slide-valve having passages *p* and *s*, a piston, I', a hollow stem, I, and valves *b* and *i*, in combination with a chamber, S, provided with a port, *u*, valve *w*, piston U', and pipe V, substantially as and for the purpose specified.

385,199. CASH REGISTER AND INDICATOR.

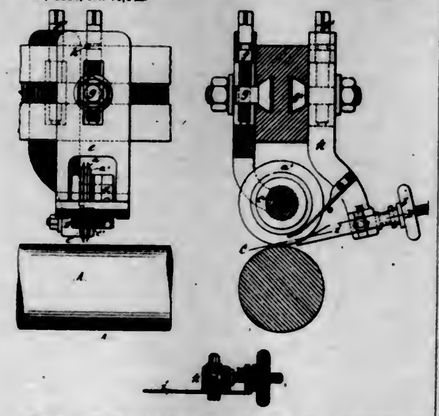
FRANK J. PATTERSON and ISAAC P. DAVIS, Dayton, Ohio, assignors to the National Cash Register Company, same place. Filed Sept. 6, 1886. Serial No. 212,790. (No model.)

Claim.—In a cash register and indicator, the combination, with the money-till and bolt mechanism for unlocking the same, of a bell-crank lever pivoted within the till-compartment and having one end engaging said drawer, while the other end is weighted to cause it to swing on its pivot when the bolt releases the till, and by such movement propel the till from its compartment, substantially as set forth.

385,200. SECONDARY BATTERY.

ANTHONY REICHENBACH, London, England, assignor to the Electric Car Company of America, Philadelphia, Pa. Filed Mar. 22, 1888. Serial No. 268,186. (No model.)

Claim.—1. An electrode for secondary batteries, consisting of a retaining-plate having a series of double-concave grooves parallel to each other and containing therein cylindrical pieces of active material exposed equally on both sides of the plate, the exposed portions being the outwardly curved or raised lateral surfaces of the cylindrical pieces of active material, which project beyond the surface of the retaining-plate.



2. An electrode for a secondary battery, consisting of a retain-

ing-plate having a series of parallel openings through the same and a series of parallel previously-formed cylinders of compacted active material arranged in said openings and extending out from both surfaces to form ribs or raised portions of active material extending beyond the surface of the retaining-plate.

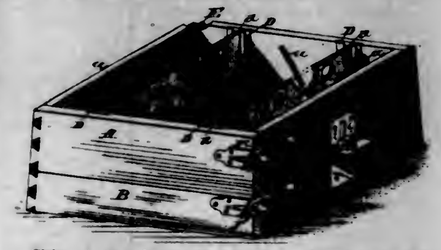
3. An electrode for a secondary battery, consisting of a series of cylindrical pieces of active material formed of a firmly-compacted mass under pressure, arranged parallel and close to each other without touching, a retaining-plate of metal cast about said active-material cylindrical pieces and shrunk thereon to form a positive contact and a firm electrode, and in which the cylinders extend out upon each side of the retaining-plate, forming parallel ribs.

4. A cylinder or section of active material for an electrode, consisting of an elongated mass of oxide of lead or equivalent active material compacted into a solid smooth-surfaced cylinder or section by pressure.

385,201. GROOVING APPARATUS FOR CARD-BOARD, LEATHER, AND LIKE MATERIAL. THEODOR REICH, Dresden, Saxony, Germany, assignor of one-half to Jean Siburtel, same place. Filed May 7, 1887. Serial No. 237,403. (No model.) Patented in England Apr. 30, 1886, No. 5,894; in France Mar. 28, 1887, No. 176,049, and in Belgium Mar. 26, 1887, No. 76,842.

Claim.—1. The combination, with a rail, of a longitudinally-slotted holder, a bolt passed through the slot of the holder into the rail, a bolt mounted longitudinally in the slot in the holder and passed through a screw-threaded aperture in the bolt that holds the holder on the rail, and cutters on the holder, substantially as herein shown and described.

2. The combination, with a rail, of the holders *e* and *k* on the same, the cutters *a a'*, mounted to turn in the lower forked end of the holder *e*, the clamping-piece *s* on the holder *k*, the screw *m* on the holder *k*, the nut *l*, mounted on the screw *m* and having an annular groove, the gouge *i*, supported by the clamping device *s* and having a bent end inserted in the groove of the nut *l*, and the scraper *o* on the holder *k*, substantially as herein shown and described.



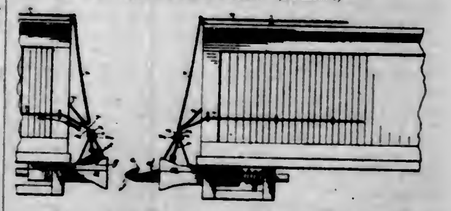
385,202. EVAPORATOR. NATHANIEL R. RICE, Chicago, Ill. Filed Apr. 9, 1887. Serial No. 234,314. (No model.)

Claim.—1. In an evaporator, the combination of the case A, provided with partitions B, said partitions having passages therethrough, with the closed horizontal tubes D, having circulating and heating cross-pipes, said tubes being placed in the chambers formed by the partitions, leaving a space between said tubes and the bottom of the case A, whereby a continuous circulation of the liquid is obtained, substantially as described.

2. In an evaporator, the combination of the case A, provided with partitions B, passages for the liquids at the ends of the partitions, the bottom formed with the inclined sides C, and the horizontal tubes D, having circulating and heating cross-pipes, said tubes being placed within the chambers formed by the partitions, leaving a space between the tubes and the bottom of the case A, substantially as described.

385,203. MOLDER'S SNAP-FLASK. EDWARD RILEY, Milwaukee, Wis., assignor of one-half to the Milwaukee Harvester Company. Filed Apr. 17, 1886. Serial No. 199,173. (No model.)

Claim.—1. As an improved article of manufacture, a snap-flask having the sides thereof tapered inwardly, whereby there is a gradual decrease in the area of said flask from the bottom of the drag to the top of the cope, substantially as set forth.

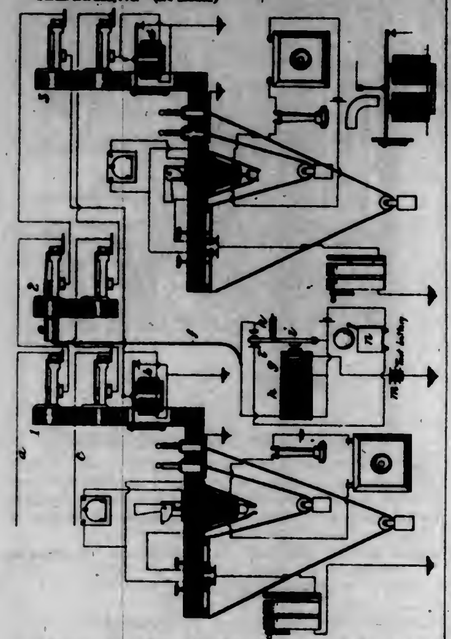


2. A snap-flask having the inner sides of its cope provided with cleats that are more or less inclined and of such contour that they will readily leave the sand when said flask is opened for removal from a mold, substantially as set forth.

3. A snap-flask having two opposite inner sides of its cope and drag provided with ways, in combination with sand-plates having their ends shaped to fit said ways, the latter and said ends of the sand-plates being of such contour as to readily separate when the flask is opened for removal from a mold, substantially as set forth.

4. A snap-flask having the inner sides of its cope provided with beveled cleats that are more or less inclined and wedge-shaped ways secured to two opposite sides of the cope and drag, in combination with sand-plates having their ends of a contour corresponding to that of the ways and adapted to loosely fit the latter, substantially as set forth.

5. A snap-flask, in combination with castings let into two opposite sides of the cope and drag and provided with ways having stops at their lower ends, and sand-plates having their ends shaped to loosely fit said ways, the latter and said ends of the sand-plates being of such contour as to readily separate from each other when the flask is opened, substantially as set forth.

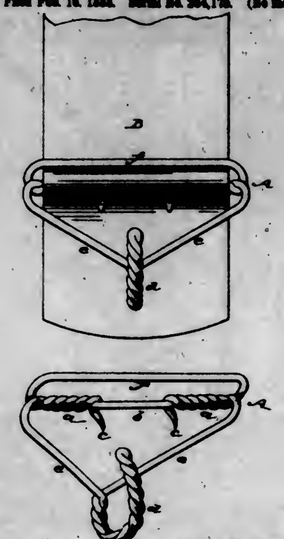


385,204. CAR-COUPLING. HAMPTON S. SANDERS, Magnolia, Ark. Filed Feb. 6, 1888. Serial No. 263,110. (No model.)

Claim.—1. In a car-coupler, as above described, the friction-pulley holder *m*, having the arms *l*, secured to the upper face of the bulk-heads *c*, grooved friction-rollers *n*, pinioned in bearings *o* on said holder, leaving the opening *p*, rope *r*, one end attached to the dog *g*, the other passing up through the opening *r*, then divided into three parts, substantially as shown and described, and for the purposes set forth.

2. A car-coupler consisting of the bulk-heads *c c*, having the dogs *f*, raised points *i*, and depressions *k*, coupling-pin *d*, having the open *o* and straight bottom beyond the raised points *i*, friction-roller holders *m*, supported by the arms *l*, grooved friction-rollers pinioned in bearings *o* on said friction-roller holder, and rope *r*, secured to dog *f* and passing between said friction-rollers, all substantially as shown and described, and for the purposes set forth.

385,205. TEST SYSTEM FOR MULTIPLE SWITCH-BOARDS. CHARLES E. SCRIBNER, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Dec. 27, 1886. Renewed Nov. 21, 1887. Serial No. 255,771. (No model.)



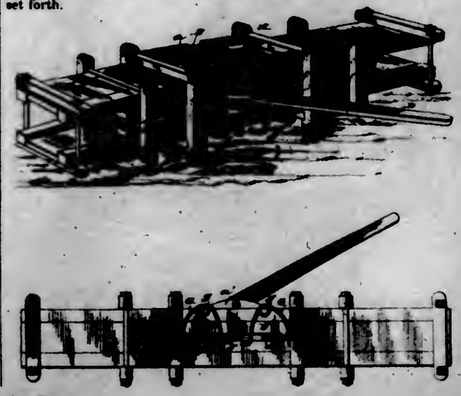
Claim.—1. A telephone-line connected with a switch on each of two or more switch-boards and through a polarized annunciator to ground, in combination with a shunt around said polarized annunciator, which is closed when current is sent in one direction through the annunciator, and testing apparatus consisting of an electro-magnet having two windings, one of low resistance and the other of high resistance, a battery included in a normally-open ground-circuit with said electro-magnet, and switching apparatus whereby on closing said circuit to line at any switch of the line the shunt will be closed around the polarized annunciator, and thereupon the circuit of the testing apparatus is changed so as to include the high-resistance winding, substantially as described.

2. The combination, with a telephone-line passing through a series of spring-jacks, the spring-jack switches being distributed on different boards, of a polarized annunciator included in said line between the switch on the last board and the ground, a shunting device operated by the armature of said polarized annunciator to shunt out the coils immediately on said annunciator-magnet being energized, a ground-circuit including a battery and a doubly-wound electro-magnet of a signal device, said windings being of high and low resistance, respectively, a circuit-closing device actuated by the armature of said relay to bring the fine-wire coil into circuit on closing the battery through the coarse-wire coil directly to ground, and a plug terminal adapted to be inserted in any one of the spring-jack switches of the line, whereby on inserting the plug in any switch the line may be tested in both directions, substantially as specified.

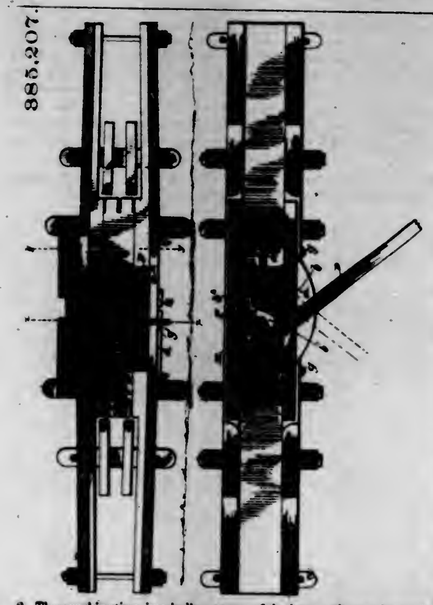
3. A telephone-line passing through a series of spring-jack switches and through a polarized annunciator to ground, a shunt around said polarized annunciator, which is closed when current is sent in one direction through the annunciator, and testing apparatus consisting of a battery included in a ground-circuit with an electro-magnet having two windings, one of low resistance and the other of high resistance, and switching apparatus whereby on closing said circuit to any switch of the line the shunt will be closed around the polarized annunciator, and thereupon, the resistance of the coil of the polarized annunciator being removed from the circuit, the circuit of the testing apparatus will be changed to include the high-resistance winding, substantially as described.

4. The combination, with a telephone-line connected with a different spring-jack switch on different sections of a multiple switch-board, of a polarized annunciator and a shunting device connected by the armature thereof, and testing apparatus consisting of a battery and a doubly-wound electro-magnet, the different windings being of high and low resistance, respectively, a plug forming the terminal of said testing-apparatus circuit, whereby on applying the plug of the testing apparatus to any switch of the line a test may be made first through said polarized relay to determine whether the line is in use on the ground side of the switch at which the test is made, and on inserting the plug further to lift the spring of the switch at which the line is being tested in the other direction, substantially as described.

385,206. BACK-BAND BUCKLE. RAPHAEL T. SEMMES, Atlanta, Ga. Filed Feb. 16, 1888. Serial No. 264,178. (No model.)



Claim.—1. A back-band hook made of wire, consisting of a loop and a hook proper, and having the free ends *c c* twisted around the center bar, *b*, from its end to its middle portion and terminating in barbs, substantially as described.

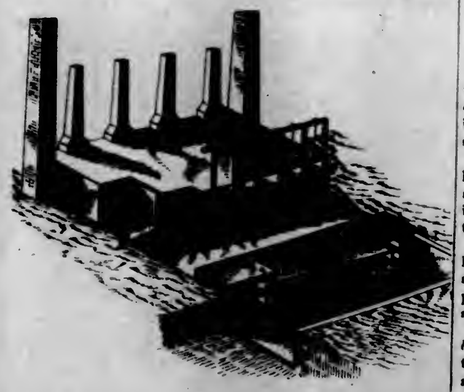


2. A back-band hook made of a single piece of wire having its end portions, *a a*, doubled and twisted with the center-bar portion *b* and terminating in barbs *c c*, and having the hook proper or nose, *d*, also doubled and twisted, essentially as and for the purposes herein set forth.

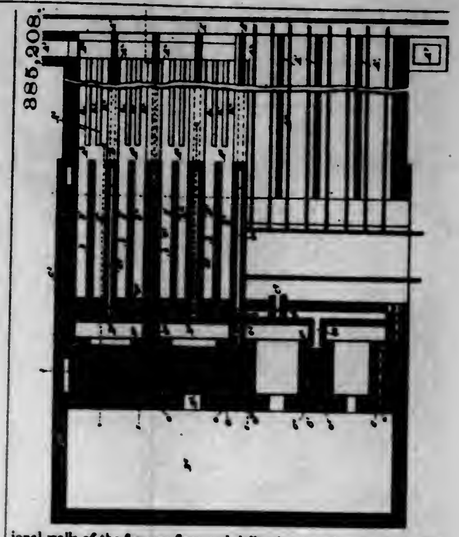
385,207. BALING-PRESS. WILLIAM P. SHAFER and GEORGE W. SHAFER, Rich Hill, Mo. Filed Dec. 3, 1887. Serial No. 256,868. (No model.)

Claim.—1. The combination, in a baling-press, of the box, a plunger located within said box, a pin projecting from the plunger through a slot in the floor of the box, springs adapted to engage said pin, whereby a recoil action is given to the plunger at the completion of the stroke, and a lever for operating the plunger, substantially as set forth.

385,207.



2. The combination, in a baling-press, of the box, a plunger located therein and recessed upon one side and having a slotted semicircular projection within said recessed side, a lever pivoted to the box and having a rounded inner end engaging said recessed portion of the plunger, and a link or plate connecting the plunger and lever and having a slotted end loosely secured within the slotted projection in the plunger, and its other end pivotally secured to the inner end of the lever, substantially as set forth.



3. The combination, in a baling-press, of a box, a plunger located therein and having spring-boards secured in recesses on top of same, said plunger being recessed on one side and provided with a projection within said recessed portion, a lever pivoted to the box, a link or plate connecting the inner end of the lever and plunger, said inner end of lever engaging the projection, and a pin projecting from the plunger through a slot in the floor of the box and adapted to engage springs upon the under side of the box, whereby, when the lever has nearly completed a stroke, the inner end of the same is disengaged from the projection and is caused to recoil by the tension of one of the springs, substantially as and for the purpose set forth.

385,208. DRIER. GEORGE W. SEARLE, Terre Haute, Ind. Filed Aug. 19, 1887. Serial No. 247,363. (No model.)

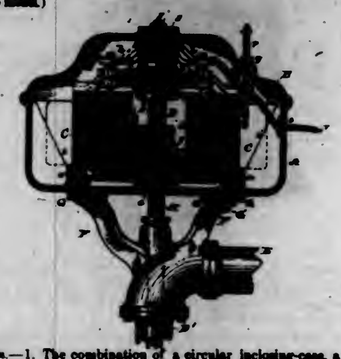
Claim.—In a drier, the combination of the drying-chambers having flues under the bottoms, furnaces having flues communicating with the flues beneath the drying-chambers, the air-ducts C and C' in the side walls of the furnaces, and air-ducts c^3 and c^4, formed in the divisional walls of the furnace-flues and delivering into the air-inlets of the drying-chambers, and the air-ducts c^4 being connected with duct C by lateral passages, and air-ducts c^3 being connected together by the duct c^5, and by it with passage or duct C', substantially as described.

385,208.

385,209. BRICK-KILN. GEORGE W. SEARLE, Terre Haute, Ind. Filed Aug. 19, 1887. Serial No. 247,364. (No model.)

Claim.—1. In a brick-kiln, the combination of a furnace, the wall of the kiln having eyes connecting the furnace with the interior of the kiln, and cold-air passages in the wall of the kiln and opening into said eyes through the top wall of the latter, substantially as described.

2. In a brick-kiln, the combination of a furnace, the wall of the kiln having eyes connecting the furnace with the interior of the kiln, and the cold-air passages, one leading to each eye, and the one leading to the middle eye passing under one of the other eyes, substantially as described.



3. In a brick-kiln, the combination of a furnace, the wall of the kiln having eyes connecting the furnace and the interior of the kiln, and cold-air passages leading from the open air into the eyes, and the passage to the middle eye passing around one of the side eyes, substantially as described.

4. In a brick-kiln, the combination of a furnace having passages b' b^2 b^3 and chamber b^4, subdivided by bricks, and the front wall of the furnace having abutments provided with eyes and facets b^5 and b^7 and abutting in the combustion-chamber of the furnace.

385,210. SALVE. JONAS B. SMITH, Newton, Kans. Filed Jan. 27, 1888. Serial No. 262,104. (No specimens.)

Claim.—The herein-described medicinal compound to be used as a salve, consisting of *Phytolacca*, *Arum triphyllum*, saltpeter, copperas, blue vitriol, corrosive sublimate, and vaseline, in the proportions specified.

385,211. ELECTRICAL PUMPING APPARATUS. FRANK J. SPRAGUE, New York, N. Y. Filed June 4, 1887. Serial No. 240,202. (No model.)

Claim.—1. The combination of a circular inclosing-case, a shaft passing vertically through the center of said case, a circular armature on said shaft, and a circular field-magnet resting on the bottom of said case, substantially as set forth.

2. The combination of an electric motor, a case inclosing said motor, a removable cover for said case, and bearings for the motor-shaft supported from the case and independent of the cover, substantially as set forth.

3. The combination of an inclosing-case having a removable cover, and an electric motor in said case having a vertically-placed armature with its upper shaft-bearing independent of the cover, substantially as set forth.

4. The combination of a shaft and a journal inclosing and supporting said shaft, said shaft having a cross-aperture within said journal, an opening for the admission of oil, and a longitudinal bore or aperture extending continuously from said opening to said cross-aperture, substantially as set forth.

5. The combination of a vertically-placed shaft and a journal inclosing said shaft at its lower end, said shaft having a longitudinal bore or aperture extending continuously from its upper end to a point within said journal, where there is a communicating cross-aperture, substantially as set forth.

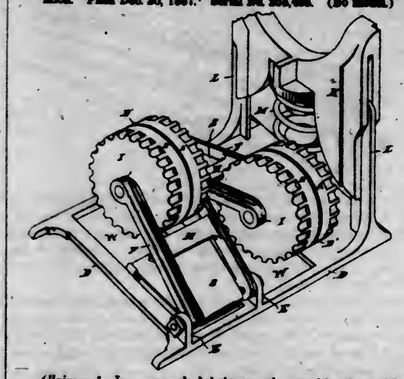
6. The combination of the inclosing-case, the shaft passing vertically through said case, the bearing-pin in the top of the case entering the end of the shaft, and bearings for the shaft in the lower side of the case, said bearing-pin having a longitudinal aperture extending from its top, a communicating cross-aperture extending to its bearing-surface, and said shaft having a longitudinal bore or aperture extending from its upper end and a cross-aperture at its lower bearing, substantially as set forth.

7. The combination of a pump and a case inclosing an electric motor detachably connected with said pump, said case having guiding projections on its bottom for determining its position on the pump, substantially as set forth.

8. The combination of a rotary pump provided with upwardly-projecting standards and a shaft extending vertically up from said pump, with an inclosing-case, an electric motor placed vertically therein, means for securing said case upon said standards, and means for connecting the pump-shaft with the motor-shaft, substantially as set forth.

9. The circular field-magnet consisting of two semicircular cores wound with wire coils and curved bars secured to the ends of said cores on each side, substantially as set forth.

10. The combination of a separable motor and pump and a spring-connection between their shafts, substantially as set forth.

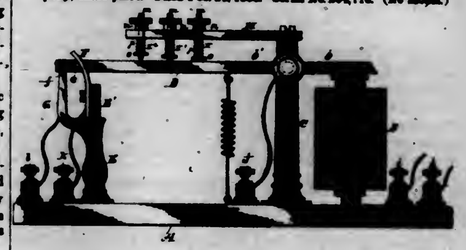


385,212. STOVE-PIPE THIMBLE. ALEXANDER SEARS, Fort Wayne, Ind. Filed May 6, 1886. Serial No. 201,255. (No model.)

Claim.—In a stove-pipe thimble, the combination of the adjustable cylinders A B, the annular flanged plates C C, secured to said cylinders and provided with inner rabbeted edges, *d*, the annular perforated plates D D, having annular inner rims or flanges, *k k*, and the inner cylinders, F F', attached to said flanges, substantially as described.

385,212.

385,218. CAR-AXLE LUBRICATOR. JAMES J. SEEVER, Owosso, Mich. Filed Dec. 20, 1887. Serial No. 258,422. (No model.)



Claim.—1. In a car-axle lubricator, the combination, with a suitable frame, of rollers supported flexibly within said frame, having plain or smooth central parts or surfaces, with shallow corrugations on each side of such plain surfaces and parallel with the axis of the roller, substantially as and for the purposes set forth.

2. In a car-axle lubricator, the combination, with a suitable frame, of rollers supported flexibly with said frame, having the smooth or plain surfaces at A', a continuous centrally-located recess, B', and indentations C upon the edges of the rollers, all arranged substantially as and for the purpose set forth.

3. In a car-axle lubricator, the combination, with a frame, of the rollers flexibly supported within said frame, said rollers being provided with a continuous centrally-located recess, B', and smooth portion A', extending on both sides of said recess to the edges of the rollers, with indentations C at the edges, all constructed substantially as and for the purpose set forth.

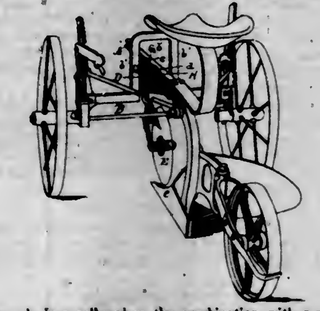
385,214. TELEGRAPH-RELAY. FREDERICK SUTTON, and CHARLES WHEELER, Louisville, Ky., assignors to the American Semaphore Company, same place. Filed Feb. 21, 1888. Serial No. 264,716. (No model.)

Claim.—1. In a relay, the combination, with an electro-magnet and a pivoted lever, of a series of yielding abutments arranged in the path of said lever and adapted to be engaged in regular order, substantially as set forth.

2. In a relay, the combination, with an electro-magnet and a pivoted lever, of a series of yielding abutments in the path of said lever.

and a spring-contact with which said lever makes contact, substantially as set forth.

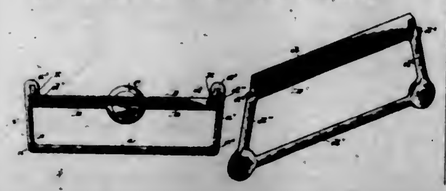
3. In a relay, the combination, with an electro-magnet and a pivoted lever carrying an armature at one end and a contact-point near the other end, of an arm, yielding abutments mounted therein, a curved spring secured to a suitable post and adapted to engage said lever, and an arm with which the lever makes contact, substantially as set forth.



385,215. ELECTRICAL CONNECTOR. FREDERICK STITES, and CHARLES WEHRLE, Louisville, Ky., assignors to the American Semaphore Company, same place. Filed Feb. 21, 1888. Serial No. 264,734. (No model.)

Claim.—1. In an electrical connection, the combination, with two sections of railroad-rail, each of which is provided with a perforation, of collars each having a central opening for the reception of one end of a wire and adapted to closely fit within the perforation in the track-section, and a wire passing through both collars and secured thereto, substantially as set forth.

2. In an electrical connector, the combination, with two sections of a railroad-rail, each of which is provided with a tapering opening, of the collars shaped externally to closely fit within said openings and a wire the ends of which are secured within openings formed in said collars, substantially as set forth.



385,216. PLOW. JOHN THOMPSON and SAMUEL R. SHORES, Beloit, Wis.; said Shores assignor to John Thompson & Sons, (Limited,) same place. Filed Sept. 26, 1887. Serial No. 250,656. (No model.)

Claim.—1. In a sulky-plow, the combination, with a widened slotted arch in the frame-work, of a plow-beam provided with a brace fitting within said slotted arch and guided thereby, and a colter secured to said plow-beam, and with its body underneath said slotted arch, whereby the colter can run with its cutting-edge over the plow-point and at one side of the vertical plane of the plow-beam, and can also be raised without obstruction from the frame-work, substantially as described.

2. In a sulky-plow, the combination, with a widened slotted arch in the frame-work, of a plow-beam provided with a brace fitting within said slotted arch and guided thereby, and a colter and its shank, clasps for embracing said shank, and a U-shaped rod for securing said clasps together and to the plow-brace, substantially as described.

385,217. BROOM-HEAD. WILLIAM W. THOMPSON, Guthrie Centre, Iowa. Filed Oct. 3, 1887. Serial No. 251,331. (No model.)

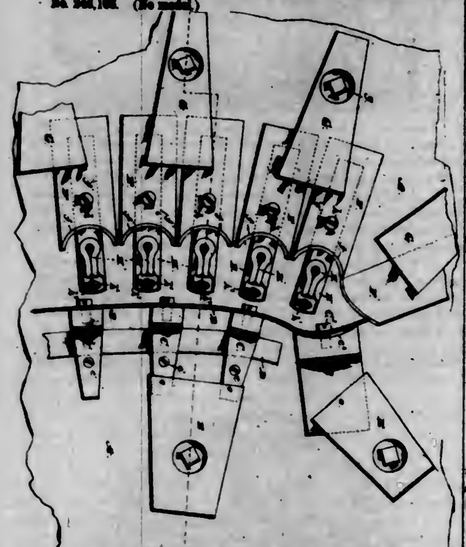
385,217.

Claim.—1. The herein-described broom-head, comprising the frame having the projecting arms provided with hooked ends, the clamping-plate, the nutted bolts, and the blocks or wedges, substantially as shown and described.

2. The combination, with the frame, of the outwardly-projecting arms, the clamping-plate having upper shouldered ends, and the nutted bolts passed through apertures in the outer ends of the lower longitudinal bars of said frame and clamping-plate, substantially as shown and described.

385,218. BOOT OR SHOE. GEORGE VALLIANT, Toronto, Ontario, Canada. Filed May 26, 1887. Serial No. 239,033. (No model.)

Claim.—1. A lace-hole strip of leather having a series of independent tongues bent back on the strip and separately fastened to the body of the strip, so as to form loops for the lacing, substantially as and for the purpose set forth.



2. A lace-hole strip having the series of lace-holes along its lower portion and the series of loops along its upper portion, substantially as and for the purpose shown.

3. In combination with the quarter of a boot or shoe, the two strips on the quarter-edges, each provided with the series of lacing-holes on their lower portions and with the series of loops for the lacing along their upper portions, substantially as and for the purpose specified.

4. In combination with the quarter of a boot or shoe, the strips fastened on the quarter-edges, each provided with a series of lace-holes, a series of loops made of tongues of the strip folded back and fastened to the strip at their ends and with a lace-hole above the series of loops, substantially as and for the purpose shown.

5. In combination with the quarter of a boot or shoe, the lacing-strips fastened on the quarter-edges, provided with series of lacing-loops made of tongues on the strips folded back and fastened, each loops being situated, substantially as described, that those on one strip come directly opposite those on the other strip, substantially as and for the purpose described.

385,219. MECHANISM FOR STAMPING OR CUTTING OUT BUTTON-HOLE FLIES. GEORGE VALLIANT, Toronto, Ontario, Canada, and CHRISTIAN DAEBER, New York, N. Y. Filed Aug. 4, 1887. Serial No. 246,168. (No model.)

Claim.—1. In combination with a flexible knife, a series of independently-adjustable blocks connected with the knife, whereby the curvature or direction of the knife can be adjusted, substantially as and for the purpose shown.

2. In combination with the flexible knife and a support therefor, a series of independently-adjustable pieces on the support connected with the knife and means for holding the pieces as adjusted on the support, substantially as and for the purpose set forth.

3. In combination with the flexible knife and a support therefor, the adjustable slides attached to the knife and clamps for clamping the slides against the knife-support, substantially as and for the purpose described.

4. In combination with the flexible knife, the series of blocks or slides attached to the knife, a guide, and means for clamping the slides to such guide, substantially as and for the purpose specified.

5. In combination with the flexible knife and the series of blocks or pieces attached to the knife and forked or slotted, the guide embraced within the forks or slots in the blocks and the set-screws for drawing the arms of the forks together to clamp the guide between them, substantially as and for the purpose shown.

6. In combination with the flexible knife, the series of blocks or pieces, each attached at one end to the knife and at the other end slit or slotted, the guide-strip passing through the slots in the blocks, and the set-screws for drawing together the parts of the blocks or pieces on opposite sides of the slot, so as to clamp the blocks to the strip, substantially as and for the purpose set forth.

7. In combination with the flexible knife, the series of slides attached to the knife, a supporting-table, the guide-strip to which the slides are adjustably attached, and the clamps adapted to engage the slides and clamp them to the table, substantially as and for the purpose described.

8. In combination with the flexible knife, a block having a concave face toward the knife and a screw passing through the knife and into the block, substantially as and for the purpose specified.

9. In combination with the flexible knife and a support therefor, the slide provided with a concave face toward the knife, a screw passing through the knife and into the slide between the extremes of the concave face, and a clamp to secure the slide to the support, substantially as and for the purpose shown.

10. In an apparatus for cutting out flies for boots and shoes, in combination with a suitable support, a series of adjustable cutters adapted together to cut out the outer edge of the fly, and the series of button-hole cutters made adjustable to and from the edge-cutters, substantially as and for the purpose specified.

11. In combination with the series of adjustable cutters adapted together to cut out the outer edge of a fly for boots or shoes, the series of button-hole cutters made adjustable to and from the edge-cutters and also as to their angles with reference to such cutters, substantially as and for the purpose set forth.

12. In combination with the series of movable pieces having the scallop-cutting edges, the slides made adjustable with reference to the scallop-cutters and the button-hole cutters on such slides, substantially as and for the purpose described.

13. In combination with the series of pieces, each provided with a scallop-cutting edge and having a longitudinal groove, the slides fitting and guided in these grooves, the button-hole cutters on the slides, and means for fastening the slides at any desired adjustment in the grooves, substantially as and for the purpose shown.

14. In combination with the slides for the button-hole cutters, the cutters pivotally attached to the slides, so as to be capable of being turned thereon, substantially as and for the purpose set forth.

15. In combination with a slide or piece for carrying a button-hole cutter, the cutter pivoted thereon and means for fixing the cutter at any point to which it may be swung on its pivotal connection with the supporting-piece, substantially as and for the purpose described.

16. In an apparatus for cutting out flies for boots and shoes, a flexible knife for cutting the inner or attaching edge of the fly, and adjusting devices for adjusting the curvature of the knife, the series of adjustable pieces carrying cutters to cut the outer edge of the fly and adjustable button-hole cutters, all in combination with each other and with a suitable support, substantially as and for the purpose specified.

385,220. COMPOSITION FOOD FOR CATTLE, HORSES, AND SWINE. WALDEMAR WEHRSEN, Milwaukee, Wis. Filed Aug. 30, 1887. Serial No. 248,570. (No specimens.)

Claim.—A composition food for cattle, horses, and swine, consisting of a mixture of refuse distillery-swill, sawdust, ground linseed, salt, and rye-flour, in practically the proportions hereinbefore named, baked into loaves, substantially as set forth.

385,221. CIGAR-CUTTER. CHARLES P. YOUNG and JOHN W. SHERRER, York, Pa.; said Sherrer assignor to John H. Thomas, same place. Filed Apr. 16, 1888. Serial No. 271,085. (No model.)

Claim.—1. In a cigar-cutter, the combination, with the base and the throat-plate, of the spring-actuated rock-shaft, the operating-lever attached thereto, so as to rotate with it, a rotating cutter mounted loosely upon the rock-shaft, a ratchet-wheel mounted loosely upon the rock-shaft and engaging the said cutter, and the pawl, substantially as described.

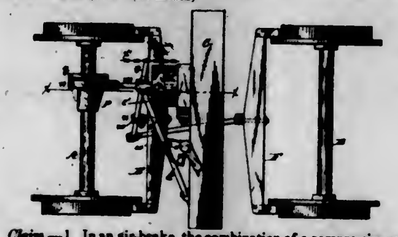
2. In a cigar-cutter, the combination, with the base and the throat-plate, of the spring-actuated rock-shaft provided with a head, *e*, a rotating cutter, H, provided with blades A, a ratchet-wheel engaging the cutter H, the said cutter and ratchet-wheel being mounted loosely upon the rock-shaft, the operating-lever, also upon this shaft, the rod G, adapted to secure the operating-lever to the shaft, the handle F, and the spring-pawls, substantially as described.

385,222. TANNING PROCESS. WILLIAM EARL, Newark, N. J. Filed Dec. 26, 1887. Serial No. 259,261. (No specimens.)

Claim.—1. The method herein described of tanning skins, which consists in subjecting the prepared and depilated skins successively to the action of three different tanning solutions: first, to a solution of bichromate of potassium, muriatic acid, and water; secondly, to a solution of hyposulphite of soda, sulphuric acid, and water, and, thirdly, to a mixture of saponified neat's-foot oil and a suitable bark extract, substantially as set forth.

2. The method herein described of tanning skins, which consists, first, in subjecting the skins to the preparatory treatment of unhairing, softening, and cleaning the same; second, subjecting the skins to the action of a solution of bichromate of potassium, salt, muriatic acid, and water; thirdly, to the action of a solution of hyposulphite of soda, sulphuric acid, and water, and, fourthly, to the action of a mixture of saponified neat's-foot oil with a suitable bark extract, substantially as set forth.

385,223. TRACE-LOCK FOR HARNESS. LEE ANDERSON, Paris, Tex. Filed Apr. 14, 1888. Serial No. 271,009. (No model.)



Claim.—1. In a trace-lock, the combination, with the slotted plate adapted to be secured to a trace, and the locking-plate pivoted thereto, of the bolt B, having the angular portion *a*, the shank *c'*, and the head *b*, rounded on its outer side, substantially as specified.

2. In a trace-lock, the combination, with the singletree and the bolt, of the recessed and slotted metal strap, the locking-plate pivoted to said strap, and the spring, substantially as specified.

3. In a trace-lock, the combination of the bolt B, the metal strap secured to the trace, provided with the recess *c*, the projection *c'*, and the slot *d*, having the enlarged opening *d'*, the locking-plate pivoted on the recess, having the opening *g*, and the spring, substantially as specified.

385,224. AIR-BRAKE. EDWARD ANDREWS, Pottsville, Pa., assignor of one-half to William G. Metz, same place. Filed Jan. 26, 1888. Serial No. 261,982. (No model.)

Claim.—1. In an air-brake, the combination of a compressing-cylinder operated from the axle of the car, a conical eccentric-cam, a laterally-adjustable eccentric strap and rod, and a brake-cylinder having its piston-rod in operating contact with a brake-lever, substantially as described.

2. In an air-brake, the combination of a compressing-cylinder operated from the axle of the car, a conical eccentric-cam, an eccentric-strap having a rod connected to the piston of the air-compressing cylinder by a ball-and-socket joint, a brake-cylinder operating upon the brake-levers, and means for putting on and releasing the brakes, substantially as described.

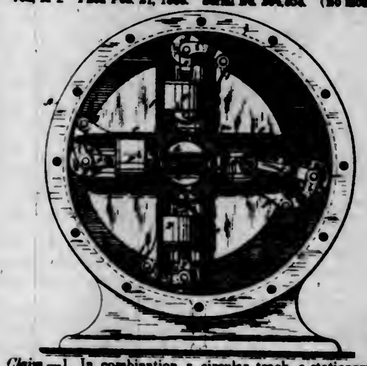
3. In an air-brake, the combination of a compressing-cylinder and a brake-cylinder having their inner ends in the same plane and connected directly by ports in a base common to both cylinders, valve-chambers and valves in said base, and a detachable cover on one side of the base, substantially as described.

4. In an air-brake, the combination of a compressing-cylinder and a brake-cylinder having their inner ends in the same plane and connected directly by ports in a base common to both cylinders, valves for controlling said ports, a relief-port in said base, connections between the compressing-cylinder and the axle of a car, an arm or lever for controlling said relief-port, and suitable means for applying and releasing the brakes, and simultaneously therewith opening and closing the relief-port, substantially as described.

5. In an air-brake, the combination of a compressing-cylinder and a brake-cylinder having their inner ends in the same plane, connected directly by ports and open outer ends, connections between the brake-cylinder and the brake-beam of a car, and an escape-port in the wall of the brake-cylinder uncovered by its piston under excessive pressure, substantially as described.

6. In an air-brake, the combination of a compressing-cylinder operated from the axle of the car, a brake-cylinder communicating therewith, a chipper, a rock-shaft and cam, and toggle-levers, substantially as described.

385,225. TOY MONEY-BOX. CHARLES A. BAILEY, Middletown, Conn. Filed Jan. 19, 1888. Serial No. 261,292. (No model.)

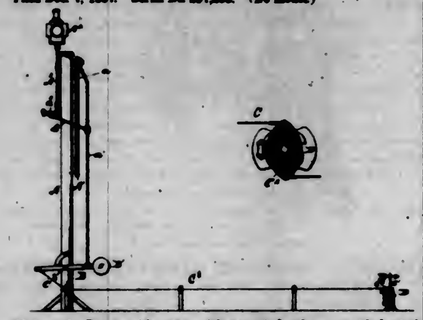


Claim.—1. In a toy bank, the figure of a foot-ball player having a pivoted leg provided with a crank and operating-spring secured to the said crank and to the base, in combination with a catch-trigger pivoted to the rigid portion of the figure, substantially as specified.

2. A toy bank consisting of a slotted base having a slotted coin-receptacle at one end, a foot-ball supported on a pivoted arm in the middle portion, and at the opposite end of said base a figure having a spring-operated crank-leg and trigger, substantially as specified.

3. In a toy bank, the combination, with the rigid portion of the figure of a foot-ball player, of the movable crank-leg and its operating-spring, the transverse shaft carrying the arms of the figure and having a projection, *n*, the rear lug, *m*, the slotted rod N, and the pivoted head portion of said figure, substantially as specified.

385,226. ROTARY CYLINDER-ENGINE. JOHN S. BARNES, Warren, R. I. Filed Feb. 21, 1888. Serial No. 264,858. (No model.)

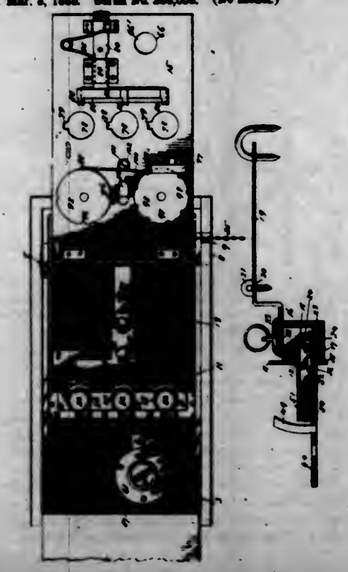


Claim.—1. In combination, a circular track, a stationary valve eccentric with the said track, the radial piston-cylinders adapted to revolve upon the stationary valve, the pistons provided with a pivoted link and roller which are adapted to reciprocate with the piston, and the link pivoted exteriorly of the piston-chamber for guiding the movement of the piston-link and roller, substantially as described.

2. In combination, a closed case the inner periphery of which forms a circular track, a stationary valve eccentric with the said track, the radial piston-cylinders adapted to revolve upon the stationary valve, the pistons provided with a pivoted link and roller which are adapted to reciprocate with the piston, and the link pivoted exteriorly of the piston-chamber for guiding the movement of the piston-link and roller, and a supplementary passage leading from the chamber of the case to the exhaust-passage of the valve, substantially as and for the purpose specified.

3. In combination, a closed case the inner periphery of which forms a circular track, a stationary valve eccentric with the said track, the radial piston-cylinders adapted to revolve upon the stationary valve, the pistons provided with a pivoted link and roller adapted to reciprocate with the piston, the link pivoted exteriorly of the piston-chamber for guiding the movement of the piston-link and roller, the shaft in line with the axis of the stationary valve, a valve-tightening screw between the inner end of the shaft and the inner end of the stationary valve, and means for imparting movement from the rotary piston-cylinders to the shaft, substantially as described.

4. In combination, a closed case the inner periphery of which forms a circular track, a stationary valve eccentric with the said track, the radial piston-cylinders adapted to revolve upon the stationary valve, the pistons provided with a pivoted link and roller adapted to reciprocate with the piston, the link pivoted exteriorly of the piston-chamber for guiding the movement of the piston-link and roller, the shaft in line with the axis of the stationary valve and having a fixed collar provided with a beveled edge, means for imparting rotary motion to the shaft from the rotary piston-cylinders, the beveled bearing for holding the beveled collar of the shaft, the elastic packing, means for tightening the same against the outer face of the collar of the shaft, and the stuffing-box around the shaft, substantially as described.



385,227. SEMAPHORE SIGNALING APPARATUS. ABEL BARNES, Pontiac, Mich., assignor of one-half to Robert Le Baron, same place. Filed Dec. 7, 1887. Serial No. 257,295. (No model.)

Claim.—1. The combination, with post A, having arm A' pivoted thereto to swing up and down, and the upright shaft A^3, carrying light A^2 and pivoted thereto to turn, of the rod *a'*, connected with arm A', crank a^6, connected to lower end of shaft A^3, rod a^5, joining rod *a'* and crank a^6, and the pivoted lever B, provided with the adjustable weight B', and having rod *a'* connected to it, substantially as and for the purpose described.

2. The combination, with the post A and rod *a'*, adapted to rise and fall, of the upright shaft A^3, connected with the post to revolve, and the arm A', connected therewith to rise and fall, and both of said parts connected with rod *a'* to be operated thereby, the lever B, having rod *a'* connected thereto, the switch-standard D, and a cable connecting said standard and lever B, the several parts operating as described, for the purpose set forth.

385,228. PERMUTATION-LOCK. JOHN C. BARR, Bismarck, Dak. Filed Mar. 3, 1888. Serial No. 266,053. (No model.)

Claim.—1. The combination of a lock-casing provided with a door and lock mechanism for said door, with a main-lock mechanism within said casing and devices which connect, control, and operate both of said lock mechanisms, substantially as described.

2. The combination of a lock-casing provided with a door having locking devices and a main bolt within said casing, with spindles provided with disks and constructed and arranged to connect, control, and operate said locking devices and main bolt, substantially as described.

3. In a permutation-lock, the combination of the lock-casing provided with a cover having a lock, and the main bolt secured within said casing and provided with a cross-head having lugs or arms, with the spindles and the disks mounted thereon and having radial slots which are adapted to register with and receive said lugs or arms, substantially as described.

4. In a permutation-lock, the combination of a lock-casing, a main bolt within said casing, a bolt upon the door for controlling the closure of said casing, and spindles provided with two sets of disks respectively controlling said main and door bolts, and having suitably-marked disks, substantially as described.

5. In a permutation-lock, the combination of a lock-casing provided with a door, a set of spindles, each provided with two cogged disks formed with a slot or notch in the periphery of each, a main bolt having lips or arms adapted to register with and enter the slots in one set of said disks, and another bolt secured within said lock-casing and adapted to control the door of said casing, and also having lugs or arms adapted to register with and enter the slots of the other set of disks, substantially as described.

6. In a permutation-lock, the combination of a lock-casing provided with a hinged door formed with holes and slots and having a cross-piece formed with bearings, and also with slots or notches in its edge which register with said bearings, spindles mounted in said bearings and provided with a set of inner cogged disks having a radial slot or notch in each, with a set of outer cogged disks, also formed with radial slots or notches which are adapted to register with the slots in said cross-piece, and with knobs and disks on their outer ends which project through said holes in the door, a main bolt provided with a cross-head having lips or arms which are adapted to register with and enter the slots in said inner set of disks, and having a handle projecting through a slot in said door, and a bolt adapted to be slid upon the inner side of said door and provided with a cross-head having lugs or arms which are adapted to register with and enter the slots in said cross-piece, substantially as described.

7. In a permutation-lock, the combination of a lock-casing provided with a hinged door formed with holes and slots, and having a cross-piece formed with bearings and also with slots or notches in its edge which register with said bearings, spindles mounted in said bearings and provided with a set of inner cogged disks having a radial slot or notch in each, with a set of outer cogged disks, also formed with radial slots or notches which are adapted to register with the slots in said cross-piece, and with knobs and disks on their outer ends which project through said holes in the door, a main bolt provided with a cross-head having notched lips or arms which are adapted to register with and enter the slots in said inner set of disks, and having a handle projecting through one of the slots in said door, and a bolt adapted to be slid upon the inner side of said door, and provided with a cross-head having notched lugs or arms which are adapted to register with and enter the slots in said cross-piece, the notched ends of said lips or arms being adapted to bear against the cogs of said inner and outer disks, substantially as and for the purpose described.

8. In a permutation-lock, the combination, with the main bolt 44, having an arm or lip, 48, of the spindle 27, provided with the knob 32, the dial 31, and the cogged disk 38, the disk 39, having the radial slot 40 and the notch 42, and the flat half-moon-shaped spring 41, having a stud, 43, projecting through said notch 42 and engaging the notches of said inner cogged disk, 38, substantially as described.

9. In a permutation-lock, the combination of the spindles 27, the disks 39, adjustably secured thereon and provided with radial slots 40 in their peripheries, the bolt 44, provided with a cross-head, 47, having arms or lips 48, which are adapted to register with and enter said slots in disks 39 and formed with a perforation, 72, the cross piece or bar 74, having a perforation, 73, and the pin 75, adapted to fit in either or both of said perforations, substantially as and for the purposes described.

10. In a permutation-lock, the combination of the outer cross-piece, 26, having the slots 33, the spindles 27, the disks 35, having slots 34, the plate 86, having lips 87, the bolt 80, provided with the beveled end 81, the knob 89, and the cross-head 82, having lips 83, and the spring 85, substantially as described.

11. In a permutation-lock, the combination of a lock-casing provided with a door formed with holes, lock-spindles projecting through said holes and having knobs and marked disks, a lock mechanism controlled and operated by said spindles, and one or more adjustable index-disks pivoted upon the inner side of said door and having marks

or inscriptions thereon for indicating the lock-combination and for registering successively with one or more of said holes in the door, substantially as described.

12. In a permutation-lock, the combination of a lock-casing provided with a door formed with holes, a main bolt, and a bolt for locking the door, with spindles having disks or wheels for controlling said bolts, and also knobs and marked dials projecting through said holes, the adjustable index-disks pivoted upon the inner side of said door and having inscriptions or marks upon their outer faces for indicating the combinations and for successively registering with said holes in the door, and means for holding said index-disks in their adjusted positions, substantially as described.

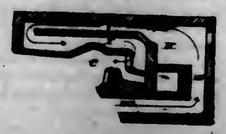
13. In a permutation-lock, the combination of a lock-casing provided with a door formed with holes, a main bolt, and a bolt for locking the door, with spindles having disks or wheels for controlling said bolts, and also knobs and marked dials projecting through said holes, the adjustable index-disks pivoted upon the inner side of said door and having inscriptions or marks upon their outer faces for indicating the combinations and for successively registering with said holes, and also having notches in their edges which register with their marks, and a spring-wire secured to said door at its middle, between said disks, and having studs upon its ends for engaging said notches, substantially as described.

14. In a permutation-lock, the combination of a lock-casing, a sliding bolt within the same provided with a cross-head having lugs or arms, spindles provided with disks having radial slots adapted to register with and receive said lugs or arms, a rod having one end rigidly secured to said cross-head, and a register or tallying device provided with a plunger against which the other end of said rod is adapted to bear, substantially as described.

15. In a permutation-lock, the combination of the lock-casing 3, the sliding bolt 44, provided with the cross-head 47, having the groove 69 and lugs or arms 48, and the spindles provided with the disks 39, having the radial slots 40, adapted to receive said lugs or arms, with the rod 67, having one end fitted in said groove and provided with the screw 70 and lips 71, which bear against said cross-head, and a register or tallying device, 61, provided with a plunger, 62, against the end of which the other end of said rod is adapted to bear, substantially as described.

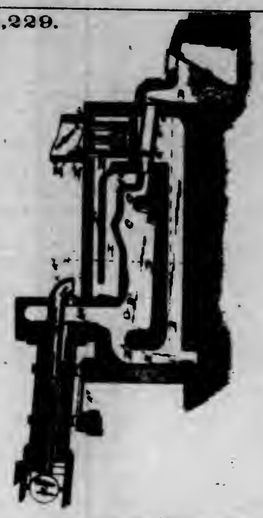
16. In a lock, the combination of a main bolt provided with a box or casing, a transverse pin fitted in the sides of said casing, a small bolt sliding within said casing and formed with a recess for said pin and with a beveled outer end, and a spiral spring bearing against the inner end of said bolt and against the end of said casing, substantially as described.

17. In a lock, the combination of a lock-casing having a bolt-slot, a throat or frame secured to the end of said casing and over said bolt-slot, a socket formed with a slot which is smaller than and registers with said bolt-slot, a main bolt provided with a box or casing having a transverse pin, a small bolt formed with a recess for said pin and with a beveled outer end, and a plug formed with a beveled end, and also with a recess for the engagement of the end of said small bolt, substantially as described.



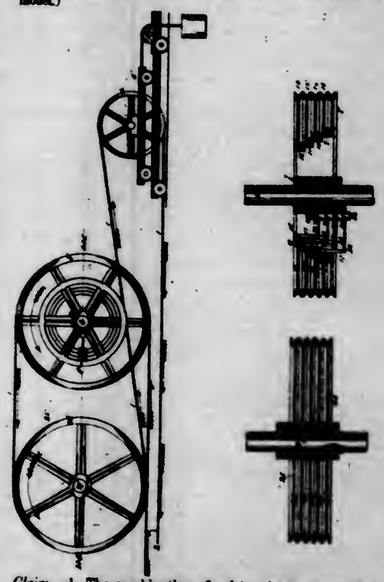
18. The combination, with the car-door, of the hasp 19, formed with the slot 20 and round perforation 22, the eye or staple 21, the plug 23, the main bolt 44, the spring 54, and the small bolt 52, substantially as described.

19. The combination of the lock-casing having a hinged door and the lock mechanism, with the outer casing, also having a hinged door inclosing said lock-casing, and devices for securing the last-named door, substantially as described.



20. The combination of the lock-casing having a hinged door and the lock mechanism, with the outer casing, also having a hinged door inclosing said lock-casing and formed with a notch, 7, and a slot, 8 9, and provided with a flat latch, 6, a wire strap, 10, and a spring, 10', substantially as described.

385,229. ORE-SMELTING FURNACE. CALEB W. BARRY, Keokuk, Iowa. Filed Dec. 30, 1886. Serial No. 222,856. (No model.)



Claim.—The combination of a smelter chamber and hearth having a diving return-flue for waste gases arranged in its sole, a gas-producer connected to said chamber, and means for heating the air-supply to said chamber, consisting of air-supply flues located in said sole, an air-heating chamber provided with pipes connected with said waste-gas flue, and air-heating flues located in the furnace-roof and connecting said air-heating chamber with said smelter chamber or hearth.

385,229.

385,230. DRIVING-DRUM FOR RAILWAY-CABLES. P. A. JOHN BEHEL, St. Louis, Mo. Filed Nov. 10, 1887. Serial No. 254,631. (No model.)

Claim.—1. The combination of a drive-shaft, a grooved flat pulley on the drive-shaft, said flat pulley having a stepped extension, and a grooved loose pulley on the stepped extension driven by frictional contact with the flat pulley, substantially as described.

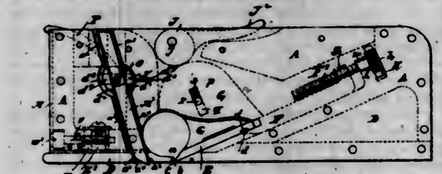
2. The combination of a drive-shaft, grooved flat pulley on the drive-shaft, said flat pulley having a stepped extension, and a grooved loose pulley of greater diameter on the stepped extension driven by frictional contact with the flat pulley, substantially as described.

3. The combination of a drive-shaft, a grooved flat pulley on the drive-shaft, said flat pulley having a stepped extension, and grooved loose pulleys on the stepped extension driven by frictional contact, substantially as described.

4. The combination of a drive-shaft, a grooved flat pulley on the drive-shaft, said flat pulley having a stepped extension, and grooved loose pulleys of gradually-increasing diameter on the stepped extension driven by frictional contact, substantially as described.

5. The combination of a drive-shaft, a grooved flat pulley on the drive-shaft, said flat pulley having a stepped extension, a grooved loose pulley on the stepped extension, and a friction-brake between the flat pulley and the loose pulley, substantially as described.

6. The combination of a drive-shaft, a grooved flat pulley on the drive-shaft, said flat pulley having a stepped extension, grooved loose pulleys on the stepped extension, and friction-brakes between the flat pulley and the loose pulleys, substantially as described.



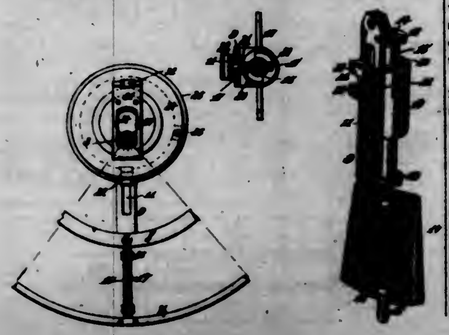
7. The combination of a drive-shaft, a grooved flat pulley on the drive-shaft, said flat pulley having a stepped extension, a grooved loose pulley on the stepped extension, and a friction-brake secured to the stepped extension and bearing against the hub of the loose pulley, substantially as described.

8. The combination of a drive-shaft, a grooved flat pulley on the drive-shaft, said flat pulley having a stepped extension, a grooved loose pulley on the stepped extension, a brake-lever having a shoe bearing against the loose pulley, and an adjusting-screw connected indirectly with the brake-lever, substantially as described.

9. The combination of a drive-shaft, a grooved flat pulley on the drive-shaft, said flat pulley having a stepped extension, a grooved loose pulley on the stepped extension, a brake-lever having a shoe bearing against the loose pulley, adjusting-screw, and spring connecting the brake-lever with the adjusting-screw, substantially as described.

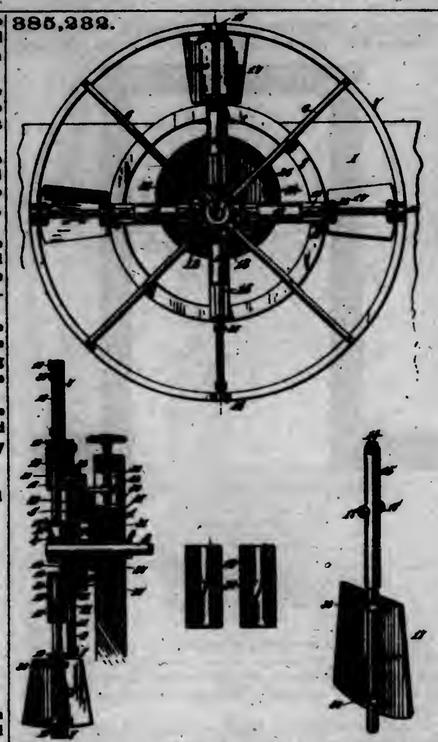
10. The combination of a drive-shaft, a grooved flat pulley on the drive-shaft, said flat pulley having a stepped extension, a grooved loose pulley on the stepped extension, a guide-shaft, and a flat pulley and a loose pulley on the guide-shaft, substantially as described.

385,281. PLANE. JULIUS A. BERNSTEIN, New York, N. Y. Filed Nov. 8, 1887. Serial No. 254,622. (No model.)



Claim.—1. The combination, with the plane-stock having the pin r, the cam J, and the plane-iron, of the block G between said cam and plane-iron, having slot g, substantially as described.

2. The combination, with the plane-stock having the pin r, the cam J, and the plane-iron, of the block G between said cam and plane-iron, having slot g, and spring e, substantially as and for the purpose described.



3. The combination, with the recessed plane-stock having lug m, screw F^3, ribbed plane-holder F, having lug g, notched plane-iron E, and pivoted cam J, having handle J^3, of block G between said cam and plane-iron, having slot g, and spring e, substantially as and for the purpose described.

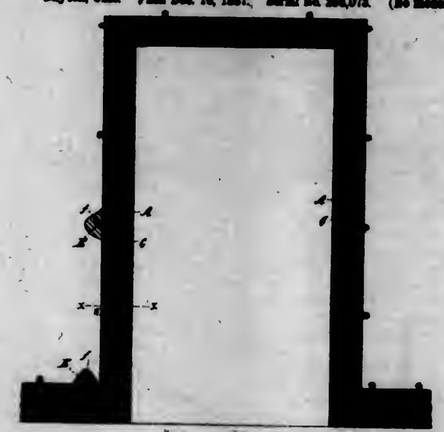
4. The combination, with a plane-stock having vertically-arranged recesses c^2 c^2, and the horizontal grooves d^3 d^3, of the clamping-blocks N N, having dovetailed sockets, inwardly-extending projections d^4, and threaded screw-receiving holes, the right and left threaded screw having the intermediate projecting lovirs, P, and grooving-knives having dovetailed edges bearing in said socketed block, substantially as described, for the purposes set forth.

385,282. FEATHERING PADDLE-WHEELS. DAVID J. BLAKER, Westernville, assignor of one-half to Henry D. Hager, Rome, N. Y. Filed Sept. 10, 1887. Serial No. 249,369. (No model.)

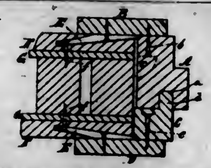
385,282.

Claim.—1. In a paddle or propeller wheel, a series of floats mounted on radial shafts adapted to turn in their bearings, cam-sleeves moving longitudinally on said shafts and having grooves engaging with pins on the shafts, an adjustable annulus eccentric to and mounted on the axis of the wheel, and a connection between the cam-sleeves and said annulus, substantially as described.

2. The combination, with a series of floats mounted on a series of radial shafts provided with cam pins or lugs, of sleeves having cam-grooves engaging with said cam-pins, an annulus having connection with said sleeves, and a circular bearing upon which said annulus is loosely mounted, substantially as described.



3. The combination, with a wheel having radial slotted brackets, of radial shafts having support therein and in bearings on the hub, cam-sleeves having lugs moving in the slots of said brackets and provided with grooves which engage pins on the shafts, clasps mounted on the lugs of the cam-sleeves, a flanged annulus on which said clasps may slide, a circular bearing on which the annulus may turn, and a set-screw for adjusting the eccentricity of the bearing and annulus, substantially as described.



4. The combination, with an adjustable circular bearing through which the wheel-shaft passes, of an annulus having a loose connection with a channel in said bearing, a series of radial float-shafts having support and turning in bearings on the wheel, radially-reciprocating cam-sleeves engaging with the float-shafts, and loose connections between said sleeves and the annulus, substantially as described.

5. The combination, with the wheel having radial shafts for the floats, said shafts being provided with cam-pins, of sleeves moving upon said shafts and having spiral cam-grooves with which said pins engage, an annulus eccentric to said wheel and engaging with said sleeves, and an adjusting-screw engaging with the bearing of said annulus, whereby the eccentricity of the latter may be varied, substantially as described.

6. The combination, with the shaft having a flanged hub, of slotted brackets bolted to said hub and to a concentric ring, float-shafts having bearings in lugs on said brackets, in angle-plates on the hub, and in brackets on an outer annulus, cam-sleeves having grooves 20, engaging pins 18 on the float-shafts, lugs 21 on the sleeves, clasps 22, carried by the lugs, an annulus, 24, with which the clasps engage, a circular bearing with which said annulus has loose connection, and a set-screw swiveled on the wheel-support and engaging with an arm on said bearing, substantially as described.

385,238. FINISHING OF HOUSE INTERIORS. WILLIAM J. BOSA, Dayton, Ohio. Filed Dec. 16, 1887. Serial No. 258,073. (No model.)

Claim.—1. As a new article of manufacture, a completed door-frame consisting of the facings and the jamb divided longitudinally in two parts, the sections being secured to opposite facings and adapted to be applied to the wall-opening from opposite sides, substantially as described.

2. As a new article of manufacture, a completed door-frame consisting of the facings and an interlocking jamb divided longitudinally in two parts, the sections being secured to the opposite facings and adapted to be applied to the wall-opening from opposite sides and locked together, substantially as described.

3. As a new article of manufacture, a completed door-frame consisting of the facings and the jamb divided longitudinally in two parts, having their abutting faces tongued and grooved, respectively, the sections being secured to the opposite facings and adapted to interlock with each other when the two parts of the frame are applied to the wall-opening from opposite sides, substantially as described.

4. As a new article of manufacture, a completed door-frame consisting of the facings and the jamb divided longitudinally in two parts, the sections being secured to the opposite facings and adapted to be applied to the wall-opening from opposite sides, and each of the two parts of the completed frame being provided with fastening devices arranged to secure it to the wall and be covered by the completed wall, substantially as described.

5. As a new article of manufacture, a completed door-frame consisting of the facings and an interlocking jamb divided longitudinally in two parts, the sections being secured to the opposite facings and adapted to be applied to the wall-opening from opposite sides and locked together, and each of the two parts of the completed frame being provided with fastening devices arranged to secure it to the wall and be covered by the completed wall, substantially as described.

6. As a new article of manufacture, a completed door-frame consisting of the facings and the jamb divided longitudinally in two parts, the sections being secured to the opposite facings and adapted to be applied to the wall-opening from opposite sides, and each of the two parts of the completed frame being provided with fastenings devices which project from beneath the edges of its facings and are arranged to secure it to the wall and be covered by the completed wall, substantially as described.

7. As a new article of manufacture, a completed door-frame consisting of the facings and an interlocking jamb divided longitudinally in two parts, the sections being secured to the opposite facings and adapted to be applied to the wall-opening from opposite sides and locked together, and each of the two parts of the completed frame being provided with fastening devices which project from beneath the edges of its facings and are arranged to secure it to the wall and be covered by the completed wall, substantially as described.

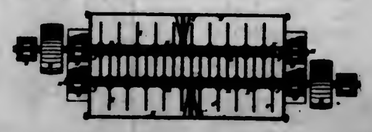
8. As a new article of manufacture, a completed door-frame consisting of the facings and the jamb divided longitudinally in two parts, the sections being secured to the opposite facings and adapted to be applied to the wall-opening from opposite sides, and each of the two parts of the completed frame being provided with fastening-lugs which project from beneath the edges of its facings and are arranged to secure it to the wall and be covered by the completed wall, substantially as described.

9. As a new article of manufacture, a completed door-frame consisting of the facings and an interlocking jamb divided longitudinally in two parts, the sections being secured to the opposite facings and adapted to be applied to the wall-opening from opposite sides and locked together, and each of the two parts of the completed frame being provided with fastening-lugs which project from beneath the edges of its facings and are arranged to secure it to the wall and be covered by the completed wall, substantially as described.

10. As a new article of manufacture, a completed door-frame consisting of the facings and the jamb divided longitudinally in two parts, having their abutting faces tongued and grooved, respectively, the sections being secured to the opposite facings and adapted to interlock with each other when applied to the wall-opening from opposite sides, and each of the two parts of said frame being provided with fastening-lugs which project from beneath the edges of its facings and are arranged to secure it to the wall and be covered by the completed wall, substantially as described.

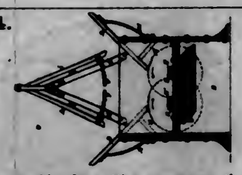
11. As a new article of manufacture, a finished facing provided with narrow fastening-lugs secured to the rear surface thereof at a point removed from the edge and projecting beyond said edges on a plane back of the rear surface of the facing and arranged to secure it to the wall and be covered by the completed wall to a point beneath the edges of the facing, substantially as described.

12. As a new article of manufacture, a completed door-frame consisting of the facings and the jamb divided longitudinally in two parts adapted to be applied to the wall-opening from opposite sides, the sections of the jamb being secured to the opposite facings by screws, nails, or other fastening devices inserted from the inner side of said sections, substantially as and for the purpose described.



13. As a new article of manufacture, a completed door-frame consisting of the facings and an interlocking jamb divided longitudinally in two parts adapted to be applied to the wall-opening from opposite sides and locked together, the sections of the jamb being secured to the opposite facings by screws, nails, or other fastening devices inserted from the inner side of said sections, substantially as and for the purpose described.

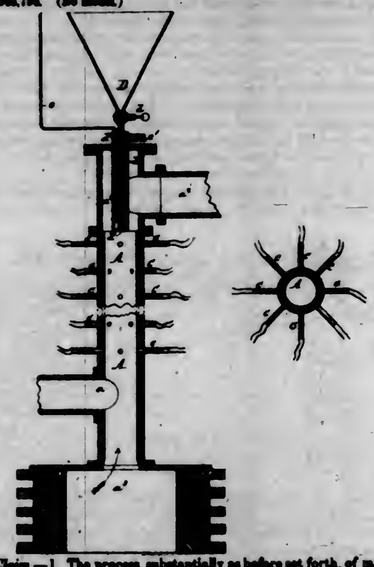
14. As a new article of manufacture, a completed door-frame consisting of the facings and the jamb divided longitudinally in two parts adapted to be applied to the wall-opening from opposite sides, the sections of the jamb being secured to the opposite facings by screws, nails, or other fastening devices inserted from the inner side of said sections, and each of the two parts of the completed door-frame being provided with fastening devices arranged to secure it to the wall and be covered by the completed wall, substantially as described.



15. As a new article of manufacture, a completed door-frame consisting of the facings and an interlocking jamb divided longitudinally in two parts adapted to be applied to the wall-opening from opposite sides and locked together, the sections of the jamb being secured to the opposite facings by screws, nails, or other fastening devices inserted from the inner part of said sections, and each of the two parts of the completed door-frame being provided with fastening devices which project from beneath the edge of its facings and are arranged to secure it to the wall and be covered by the completed wall, substantially as described.

16. As a new article of manufacture, a completed door-frame made in two parts, consisting of the facings and a two-part jamb, the abutting faces of the two parts of the jamb being tongued and grooved, respectively, to interlock with each other, the set of facings and the portion of the jamb forming each part being united by screws or nails inserted from the inner side of said part, and each of said parts being provided with fastening-lugs which project from beneath the edges of its facings and are arranged to secure it to the wall and be covered by the completed wall, substantially as described.

385,284. MACHINE FOR CUTTING SUGAR-CANE. LEOPOLD BOS, Guantanamo, Cuba. Filed Nov. 3, 1887. Serial No. 254,191. (No model.) Patented in Spain Apr. 21, 1887, No. 7,037, and in England Oct. 15, 1887, No. 14,009.



385,284.

Claim.—In a machine for cutting sugar-cane, the combination, with the two oppositely-rotating shafts carrying the series of overlapping saws and the two oppositely-arranged inclined chutes for guiding the cane between said saws from opposite sides, of two inclines pivoted at their upper ends between said chutes and adjustable with relation thereto at their lower ends, whereby the cane passing down said chutes may be regulated, substantially as described.

385,285. PROCESS OF MANUFACTURING OXIDE OF IRON. ARTHUR C. BRADLEY, Brooklyn, N. Y. Filed Aug. 12, 1887. Serial No. 246,796. (No model.)

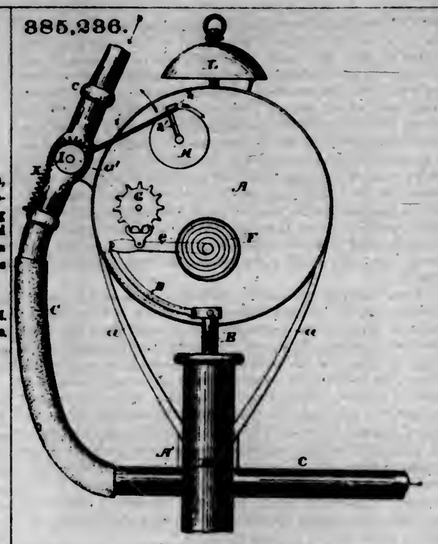
Claim.—1. The process, substantially as before set forth, of manufacturing an oxide directly from a metal, which consists in subjecting the metal, in a comminuted condition and free from earthy matter, directly to the action of an inclosed gas-flame, with an excess of highly-heated air and in collecting the pulverulent oxide from said current.

2. The process, substantially as before set forth, of manufacturing an oxide directly from a metal, which consists in subjecting the comminuted metal free from earthy matter in a shower directly to the action of an inclosed gas-flame and heated air, and in collecting the pulverulent oxide from said current.

385,286. AUTOMATIC REGULATOR FOR VULCANIZING APPARATUS AND OTHER PURPOSES. OSCAR B. BRAIN, Portland, Me. Filed Aug. 13, 1887. Serial No. 247,248. (No model.)

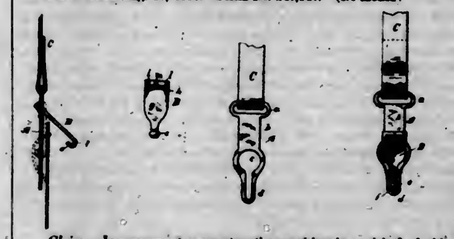
Claim.—1. In combination with the clock mechanism and the piston-rod, operated as described, the finger-bar, spring, and escapement.

2. An automatic heat-regulating device consisting of a steam-actuated piston, clock mechanism, and alarm-wind, and an automatic cut-off for the gas, substantially as described.



3. In combination with the gas-supply pipe having cock I and spring K attached thereto, the arm A and alarm-wind H, with which one end of the arm is connected, substantially as described.

4. In combination with the steam-actuated piston and the finger pivoted thereto, the clock mechanism, the gas-supply pipe, the cock I thereon, and its spring-actuated arm *i*, substantially as described.



5. The steam-pipe B', its piston B, the finger D, pivoted at one end to said piston, the bar *c*, the spring F, and the escapement G, substantially as and for the purposes set forth.

6. In combination with the gas-supply pipe C, the spring-actuated cock I, the steam-pipe B' and piston B, the escapement, and the alarm-wind, substantially as and for the purposes set forth.

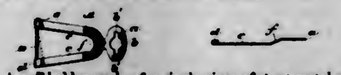
385,286.

385,287. GARMENT-SUPPORTER. FRED R. BRIGHT, Cleveland, Ohio. Filed Aug. 17, 1887. Serial No. 247,147. (No model.)

Claim.—In a garment-supporter, the combination, with the holder A, formed in its upper body portion with the longitudinal shank *b*, and provided at its lower extremity, below said shank, with the key-hole slot *c d*, of the clasp B, having its main body portion *g* provided at its lower extremity with a garment-locking device, and having its upper extremity provided at its two edges, respectively, with the sliding loop *h l*, said loop overlapping opposite sides of said shank *b* and having sliding movement thereon, substantially as set forth.

385,288. MAGAZINE FIRE-ARM. JOHN M. BROWNING and MATTHEW S. BROWNING, Ogden, Utah. Filed Dec. 13, 1887. Serial No. 257,706. (No model.)

Claim.—1. In a fire-arm in which the barrel opens into the receiver at the rear, the combination therewith of a breech-piece arranged longitudinally in rear of the barrel and constructed with laterally-projecting ribs upon its sides, and the receiver with corresponding grooves, the said grooves being deeper than the depth of the ribs, so as to allow a certain amount of vertical movement to the breech-piece, the said grooves contracting at their rear end to about the depth of the ribs and the said contracting portions opening through the receiver at the rear, the breech-piece constructed with one or more lateral projections upon its sides adapted to engage corresponding recesses in the sides of the receiver, and the breech-piece also constructed with a downward projection at its forward end, and the said projection constructed with a downward and rearwardly inclined groove, a handle arranged forward of the receiver and adapted for longitudinal reciprocating movement, with a bar extending from said handle into the receiver, and with a stud thereon adapted to work in the said groove of the breech-piece, substantially as described.



2. The combination, in a fire-arm, of a barrel opening into the

receiver at the rear, a breech-piece arranged longitudinally in the receiver in rear of the barrel and constructed with laterally-projecting ribs upon its sides, the receiver constructed with corresponding longitudinal grooves upon its inner surface, the said grooves in the receiver being deeper than the ribs on the breech-piece, the said grooves extending rearward and opening through the rear end of the receiver, the depth of the rear end being substantially the depth of the said ribs, the said breech-piece constructed with one or more lateral projections, and the receiver with corresponding recesses, with which said projections are adapted to engage when the breech-piece is in the closed position, and the breech-piece also constructed with a cam-shaped groove, a handle forward of the barrel, and a bar extending therefrom into the receiver, adapted to engage the said cam-shaped groove, and an extractor-hook on the side of the carrier adapted to engage the head of a cartridge in the barrel as the breech-piece rises, substantially as described.

3. In a magazine fire-arm, the combination of a barrel, a magazine beneath the barrel, both magazine and barrel opening into the receiver at the rear, the breech-piece E, arranged longitudinally in the receiver in rear of the barrel, constructed with longitudinal ribs H upon its sides, and the receiver with corresponding longitudinal grooves I, the breech-piece constructed with one or more lateral projections, F, and the receiver with corresponding recesses G, the said breech-piece constructed with a cam-shaped groove, L, near its forward end, a handle beneath the barrel arranged for longitudinal movement, a bar, N, extending from said barrel into the receiver and into engagement with said cam-groove L, a carrier, S, hung in the receiver beneath the barrel, with an upward projection, T, therefrom, the breech-piece constructed with a shoulder, V, adapted to engage said finger as the breech-piece approaches its extreme open position, substantially as and for the purpose described.

4. In a magazine fire-arm, the combination of the breech-piece E, constructed with one or more lateral projections, and the receiver with corresponding recesses, with which said projections on the breech-piece are adapted to engage, the breech-piece also constructed with longitudinal ribs H upon its sides, and the receiver with longitudinal grooves I, in which said ribs are adapted to work, the breech-piece also constructed with a cam-shaped groove, L, a handle beneath the barrel forward of the receiver arranged for longitudinal reciprocating movement, a bar extending from said handle into the receiver and into engagement with said cam-groove L, a carrier, S, hung in the receiver beneath the breech-piece with an upward projection therefrom, and the breech-piece provided with a shoulder adapted to engage said finger as the breech-piece approaches its extreme open position, the breech-piece also provided with an extractor, *a*, upon its side, and the carrier constructed with an overhanging finger, W, substantially as and for the purpose described.

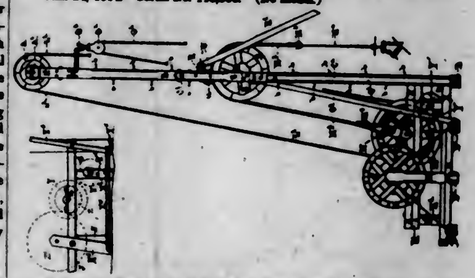
885,239. CUFF-HOLDER. EDWARD L. CLARKE, Aberdeen, Dak. Filed Apr. 18, 1888. Serial No. 271,107. (No model.)

Claim.—A cuff-holder made of a single piece of sheet metal and provided with members *c c*, one of said members being bent upon itself to retain in position a pin, D, the point of said pin being adapted to lie under a loop formed upon the end of the opposite member, the portion *a*, having an opening, *b*, and slots connecting therewith, substantially as shown, and for the purpose set forth.

885,240. CASTER FOR STOVES, &c. ANDREW H. COOK, Montezuma, Iowa. Filed Jan. 10, 1888. Serial No. 260,357. (No model.)

Claim.—1. In a combined caster and base for stoves and other articles, the combination of a base mounted upon casters, with a rotatable ring or flange mounted upon the base and adapted to be thrown below or above the plane of its casters, substantially as and for the purpose specified.

2. In a combined caster and base for stoves and other articles, the combination of a base having casters swiveled therein and outwardly-

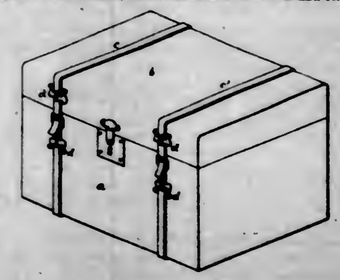


extending lugs or rivets, with a ring or flange mounted on said base and provided with slanting slots adapted to receive said lugs, substantially as specified.

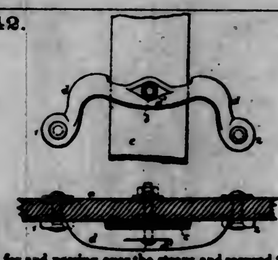
3. In a combined base and caster for stoves and other articles, the combination of a base having casters swiveled therein and outwardly-extending lugs or rivets, with a ring or flange mounted on said base and provided with slanting slots terminating in parallel slots adapted to receive said lugs and lock said flange above or below the plane of the casters, substantially as specified.

4. In a combined base and caster for stoves and other articles, the combination of a base having a countersunk leg-receiving recess, the wall of which is provided with a set-screw, and having depending peripheral perforated lugs or ears provided with rivets, and having a series of casters, with an annular ring or flange loosely mounted on the base and provided with an inwardly-flanged upper edge and a lower flanged edge, and intermediate diagonal slots terminating in horizontal slots adapted to receive said rivets, substantially as specified.

885,241. DRILLING-RIG. GEORGE CORBETT, Bradford, Pa. Filed Jan. 24, 1884. Serial No. 118,868. (No model.)



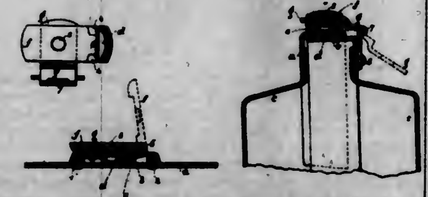
Claim.—1. In combination with a derrick and a pulley or wheel for the working-rope, a pillow-block on which said pulley or wheel is supported, having elongated bearings to allow of transverse movement of such wheel, substantially as and for the purposes set forth.



2. The combination, with the driving-shaft n, having the friction-wheel Y, and a friction-wheel, Z, of smaller diameter than the wheel Y thereon, of the bull-wheel friction-wheel and the sand-reel friction-wheel adapted to engage the wheels Z Y, respectively, swinging levers in which said bull-wheel friction-wheel and sand-reel friction-wheel are mounted, a rod connecting the ends of said levers, and a lever connected to said rod for causing the bull-wheel friction-wheel and sand-reel friction-wheel to engage the friction-wheels on the shaft n alternately, as set forth.

885,242. COMBINED TRUNK-LIFT AND STRAP-FASTENING. GEORGE CROSBY, New York, N. Y. Filed May 18, 1888. Serial No. 274,260. (No model.)

Claim.—1. The combination, in a trunk, with the strap or straps passing around the same, of the combined trunk-lift and strap fasten-



885,242.

ings *d*, slotted for and passing over the straps and secured to the body of the trunk by rivets, and each provided with a rivet or bolt, 3, passing through said lift and fastening, through a slot in the strap, and through the body or shell of the trunk to secure the strap in place, substantially as specified.

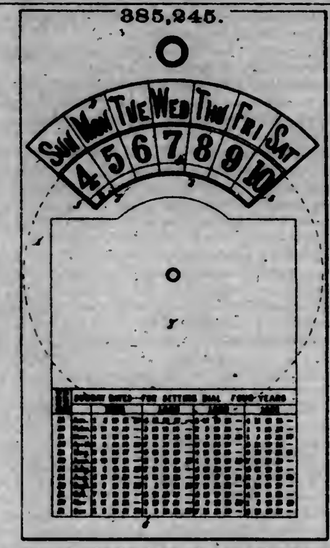
2. The combination, in a trunk, with the strap or straps passing around the same, of the combined trunk-lift and strap-fastenings *d*, slotted for and passing over the straps and having at their central portion an overhanging edge, *d'*, beneath which the fingers are adapted to pass in lifting the trunk-lid, the same being secured to the body of the trunk by rivets, and provided with a rivet or bolt, 3, passing through said lift and fastening, through a slot in the strap, and through the body or shell of the trunk, and provided with a fastening upon the inner side to secure the strap in place, substantially as specified.

885,243. FASTENING FOR HAND-BAGS AND SATCHELS. GEORGE CROSBY, New York, N. Y. Filed May 18, 1888. Serial No. 274,261. (No model.)

Claim.—1. The combination, in a fastening for hand-bags and satchels, of a frame-piece secured to one of the hinged sections of the hand-bag and having a stud thereon, a hinged hasp secured to the other hinged section of the bag and adapted to pass over the stud on the frame-piece, and a spring-catch or lifting-plate connected to the frame-piece and adapted to be snapped down upon the hinged hasp-plate, substantially as specified.

2. The combination, with the hinged sections *a b* of the bag, of the frame-piece *d*, secured to the section *a* by lugs or their equivalent and recessed upon its under side, and provided with a spring, *e*, and stud 5, the spring-catch or lifting-plate *f*, pivoted to the frame-piece *d* and acted upon by the spring *e*, and the hinged hasp *g*, secured to the section *b* and adapted to pass over the stud 5 and beneath the spring-catch or lifting-plate *f*, substantially as set forth.

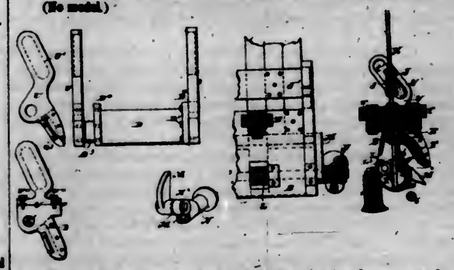
885,244. CAN FOR OIL. EDWARD G. CHESMAN, New York, N. Y. Filed Mar. 30, 1888. Serial No. 268,738. (No model.)



Claim.—The wooden heads for sheet-metal cans, each provided with a central opening to give access to the handle or to the cap of the can, and channeled, in combination with the sheet-metal bands introduced within the channel and soldered at their ends to the can for holding such heads in place, substantially as set forth.

885,245. CALENDAR. JOHN CROSBY, Glen Allen, Va. Filed Mar. 13, 1888. Serial No. 267,005. (No model.)

Claim.—1. As a new article of manufacture, a calendar consisting of a face-plate, 1, having a segmental slot and a corresponding



885,245.

space above the slot bearing stationary designations of the names of all the seven days of a week, said face-plate having a rectilinear space, 6, divided vertically into several divisions, one division containing figures giving the number of days each month in regular order in a single vertical column from top to bottom, another division containing in regular order designations of all the months in a year in a single vertical column from top to bottom, and the remaining divisions being substantially equal, and in which, under the current year and one or more succeeding years, are respectively displayed in regular order figures designating the several days of each month upon the initial day in the segmental space above the slot, falls, and a rotating dial behind the face-plate having an annular row of figures designating the thirty-one days of a month, of which figures seven only are exposed through the slot, substantially as and for the purposes described.

2. The combination, with a calendar having a space showing the days of a week in order and provided with a tabular statement showing the day of the month upon which the initial week day will fall throughout each of the months for a series of years, of a dial pivoted centrally upon the calendar-plate and having the numerical designations of the days of the month represented on its margin in spaces adapted to register with the spaces containing the designations of the days of the week, substantially as described.

885,246. CABLE-SHIFTING APPARATUS FOR STREET-RAILWAYS. JOHN H. DALE, Philadelphia, Pa., assignor of one-half to Edward D. Dougherty, same place. Filed Aug. 24, 1887. Serial No. 247,761. (No model.)

Claim.—1. The combination, with a block having flanges upon its ends, of two cam-grooved links adjustably secured to the ends of the block, substantially as set forth.

2. The combination, with a base-block having one inclined face and a wear-plate inserted longitudinally in the gripping-face of this base-block, of an upper grip-jaw having two upright links secured adjustably to its grip-block, said links being slotted diagonally to afford cams, housing-plates to support the base-block, and sliding bars secured together by cross-bars which are provided with bosses, and

thimbles on these bosses to engage the cam-slots of the limbs of the upper swinging jaw, substantially as set forth.

3. A pick-up arm and a cable-ejector limb secured to a single hub and mounted on one shaft, substantially as set forth.

4. A pick-up arm and a cable-ejector limb supported on the same shaft adjacent to each other, they being placed at right angles to each other on this shaft and adapted to move in parallel planes, substantially as set forth.

5. A pick-up arm and a cable-ejector limb affixed on the end of the supporting-shaft, adapted to receive motion from a lever, their relative positions on the shaft being such that the cable-ejector will be nearly upright when the cable-pick-up arm has raised the cable, and said ejector-limb be depressed to eject the cable when the cable-pick-up arm is downwardly moved, substantially as set forth.

6. The combination, with a base-block, housing-plates to support the base-block, a shaft that is longitudinally supported in a perforation of the base-block, a pinion affixed near the center of length of the shaft, and a connected cable pick-up arm and ejector limb mounted upon the same shaft, of a pair of sliding bars, a central rack-bar, and links and levers pivoted to the sliding bars and rack-bar to operate the swinging grip-jaw as well as the cable pick-up and ejecting devices simultaneously or consecutively and independently, substantially as set forth.

7. The combination, with a base-plate having an inclined jaw on one side, a pivoted upper grip-jaw, cam-grooves in the top ends of the limbs of the upper grip-jaw, two housing-plates attached to the base-block, a yoke, and a quadrant on top edge of the yoke, of two sliding bars held spaced apart by rigidly-affixed plates and adapted to engage the cam-grooves of the pivoted upper grip-jaw to vibrate this jaw, a center bar having rack-teeth on lower end, a cross-shaft supported to rotate in the base-block, a pinion on this shaft that engages the teeth of the rack-bar, a jointed cable pick-up arm and ejector limb mounted together, one set at each end of the base-block, links and levers to operate the sliding bars and center rack-bar, and a means for locking the levers to hold the sliding bar and rack-bar in raised or lowered adjustment, substantially as set forth.

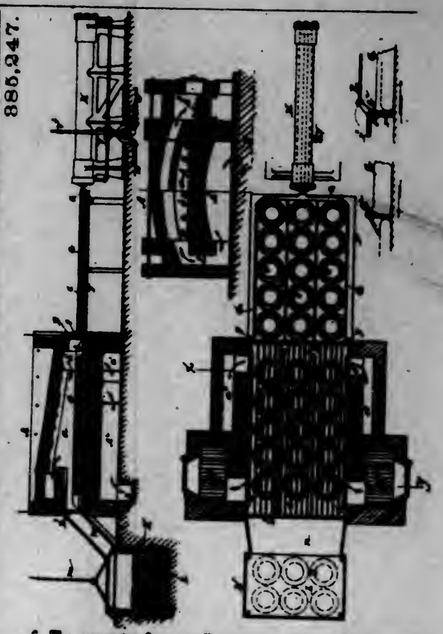
8. The combination, with an upper grip-jaw block, of an attached cam-slotted limb adapted to be adjusted to change the pressure of the upper jaw upon the lower jaw or base-block, substantially as set forth.

9. The combination, with a swinging upper grip-jaw and an adjustable wear-plate affixed to this jaw, of a movable cam-grooved limb adapted to be adjusted and regulate the pressure of the upper jaw upon the lower jaw or base-block, substantially as set forth.

10. The combination, with a pick-up arm, of a cable-ejector limb adapted to work in parallel planes and be changed in regard to the angle of divergence of their outer ends and bodies, substantially as set forth.

11. The combination, with a cable-pick-up arm and a cable-ejector limb made to move in parallel planes and have the angle of their divergence changed, of a shaft adapted to support and simultaneously rock the arm and limb, substantially as set forth.

385,247. APPARATUS FOR ANNEALING WIRE. FRED H. DANIELS, Worcester, Mass. Filed Dec. 4, 1886. Serial No. 220,656. (No model.)



Claim.—1. A furnace-charging device for wire in coils, having a reciprocating movable frame provided with guide-bars between which to receive, carry, and deposit wire in coils upon the receiving bed or hearth of a furnace, and means, substantially as described, for advancing and retracting said frame into and from the furnace, as hereinbefore set forth.

2. A furnace-charging device for wire in coils, consisting of a platform or supporting-way in front of the furnace, a movable frame having guards between which to receive, carry, and deposit the wire coils upon the furnace-bed, and an operating-motor, substantially as described, for advancing and retracting said frame into and from the furnace-chamber, as hereinbefore set forth.

3. In a charging and discharging mechanism for handling wire in coils, the combination of a platform or way, a movable frame having compartments for receiving, supporting, and transferring wire in coils, an operating-motor for reciprocating said frame along the way to and from the annealing-bed, and a swing-gate across said compartments for engaging the coils, substantially as set forth.

4. In an annealing plant for wire, the combination, with a heating-chamber and a charging-frame adapted to receive, advance, and deposit coils of wire, of guiding devices disposed at the entrance of the furnace, as at *g*, for maintaining proper alignment of the charging-frame in its advance movement into said heating and annealing chamber.

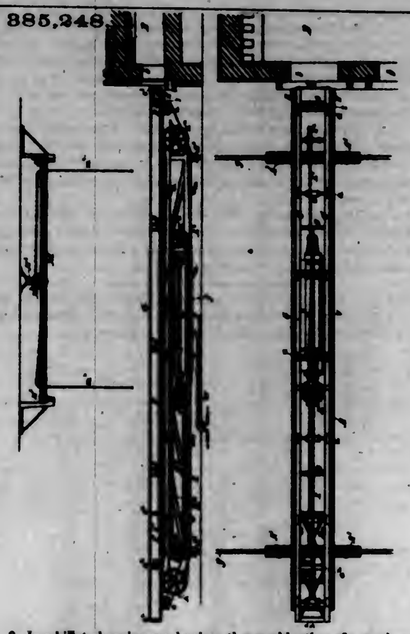
5. In an annealing plant for wire in coils, the combination, with the heating-chamber and feed-platform, of a charging or discharging frame having intermediate forks or guide-bars, substantially as set forth, whereby said frame is adapted to maintain separate two or more series of coils of wire when projecting them into or withdrawing them from said heating-chamber, substantially as set forth.

6. The apparatus for annealing wire, consisting of the annealing-furnace having entrance and exit openings or doors at its respective ends, a feed-table, a reciprocating charging-frame having compartments for supporting coils of wire while transferring them from said table to the interior of said furnace, and a cooling or equalizing chamber into which the coils of wire are projected from the furnace by the action of entering the succeeding charge, substantially as set forth.

7. In an annealing apparatus for wire, the combination of the furnace adapted for heating wire in coils, the cooling-chamber into which the coils of wire are ejected from said furnace, a covered guideway for the coils between said furnace and chamber, and a mechanically-operated ejector or charger, substantially as hereinbefore set forth.

8. The combination, with the heating-chamber in an annealing-furnace adapted for heating wire in coils, of a series of longitudinal feeder-bars that separate and confine the coils of wire to their respective lines of advancement in series, substantially as set forth.

9. The combination of a furnace, its heating-chamber having inlet and exit doors at its respective ends, a series of longitudinal feeders for separating series of coils, a reciprocating charging-frame having longitudinal bars for confining and moving forward a plurality of series of coils of wire, and an operating-motor connected with said frame for advancing and retracting it into and from the furnace, substantially as set forth.



10. An apparatus for annealing wire having a furnace adapted for heating wire in coils and a receiving pit or chamber into which the heated coils pass as they are ejected from the furnace, with a removable platform or cage within said receiving-chamber, onto which the coils are deposited and by means of which the contents of the chamber can be discharged, substantially as set forth.

11. In combination with an annealing-furnace, the charging-frame having the longitudinal bars, and the swinging gates disposed transversely on said bars for engaging with and effecting transfer of wire in coils to or from said furnace, substantially as set forth.

12. The combination, with an annealing-furnace and a reciprocating furcated charging-frame having bars for confining coils of wire in series, of a swinging gate having forwardly and backwardly engaging parts, as *r* and *r'*, and a connection for operating said gate, substantially as set forth.

385,248. APPARATUS FOR CHARGING BILLETS, BARS, &c., INTO FURNACES. FRED H. DANIELS, Worcester, Mass. Filed Jan. 24, 1887. Serial No. 225,204. (No model.)

Claim.—1. A charging mechanism having a reciprocating carrier composed of a pair of longitudinal supporters provided with removable transverse bearers adapted to receive, support, and carry forward billets or bars of metal and deposit them in a heating-furnace, in combination with a power-operating mechanism whereby said carrier is advanced and retracted.

2. In a billet-charging mechanism, the combination of a carriage, A, a reciprocating billet-carrier supported and guided on said carriage, a hydraulic-motor mechanism, and connections upon said carriage for reciprocating said billet-carrier into and from the interior of the heating-furnace, substantially as set forth.

3. In a billet-charging apparatus, a reciprocating carrier-frame composed of side bars and having transverse bearers adapted for supporting billets mounted upon a supporting-frame, in combination with mechanism for advancing and retracting said frame and means for releasing said bearers from the side bars for depositing the billets within the furnace, substantially as set forth.

4. In a charging apparatus, the combination, with the carrier whereby the billets or bars are projected or advanced into the heating-furnace, of supports or bearers formed of combustible material, substantially as and for the purpose set forth.

5. A portable billet-charging apparatus having a reciprocating carrier composed of a pair of long beams connected at their rear ends and furnished at intervals with bearers upon which the billets to be charged are supported, in combination with a supporting frame or carriage mounted on traveling wheels and provided with a guide-way or series of rolls that direct the movement of the carrier thereon, and an operating cylinder and piston supported on said carriage with connections for moving said carrier, substantially as set forth.

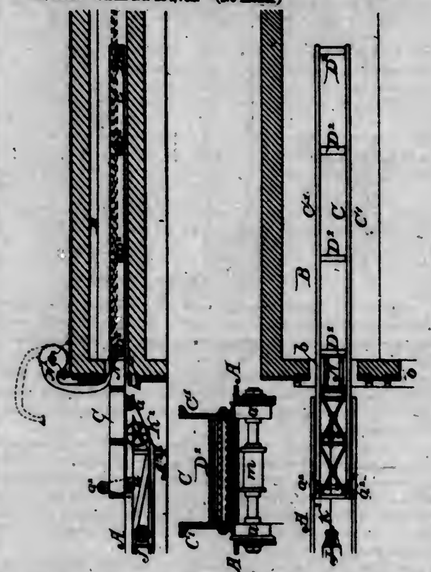
6. A billet-charging apparatus provided with a carrier or charging-way for containing a series of billets, in combination with a lifting and transferring mechanism, substantially such as described, for depositing thereon a load of billets preparatory to charging said billets into the heating-furnace, substantially as set forth.

7. In a charging apparatus, the combination, with the billet-carrier, of a wheel or truck disposed at or near the forward end of said carrier for supporting said carrier upon the furnace-bottom, substantially as set forth.

8. In a charging apparatus, the combination, with a carrier adapted for projecting or advancing a billet or series of billets into the heating-furnace, of combustible supports or bearing-bars for containing said billet.

9. In a charging apparatus, the combination, with the carrier and adjustable supports or bearing-bars for sustaining billets while advancing them into the furnace, of means for releasing said supports for depositing the billets within the furnace, substantially as set forth.

10. In a furnace-charging apparatus, the combination of a supporting-frame mounted on wheels and provided with a series of guiding-rolls, a reciprocating carrier supported and guided on said frame and guide-rolls, a hydraulic cylinder and piston with tackle chains and pulleys for imparting backward and forward movement to said carrier, and means for varying the pressure in said cylinder under control of the attendant, substantially as set forth.



11. In a billet-charging mechanism, the combination of a carrier composed of side bars or beams, a series of transverse supporting-bars sustained by adjustable plates provided with engaging-lugs, and stop-dogs for shifting said plates and releasing said transverse bars when the carrier approaches its forward limit of movement, substantially as and for the purpose set forth.

12. In a billet-charging mechanism, the combination of a carrier composed of side bars or bearers, C C', having recesses *d*, a series of transverse supporting-bars, adjustable plates for sustaining said support-bars, provided with engaging-lugs and recesses *f*, stop-dogs for shifting said plates and releasing the transverse bars when the carrier has reached its forward limit of movement, and stop-lugs for readjusting said plates when the carrier has reached its backward limit of movement, substantially as set forth.

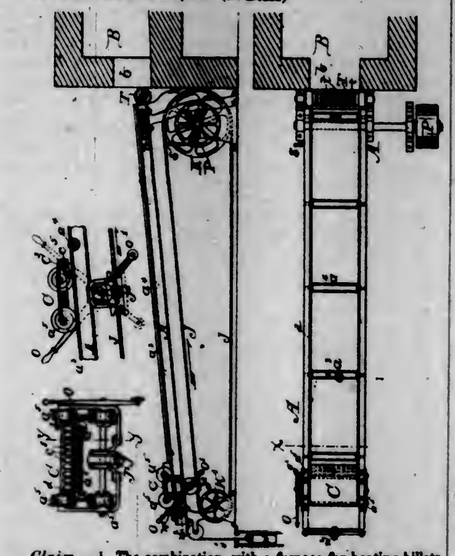
13. In a billet-charging mechanism, the combination, with a supporting-frame, of a carrier consisting of side beams rigidly framed together at their rear ends and having their forward ends linked or connected to each other in a manner to permit upward and downward springing action, while confining them for spreading apart laterally, and transverse supports or bearers for containing a load of billets, substantially as set forth.

14. The combination, with a carrier having the side bars, C, of upright fenders E, for confining the transverse bearers or support-bars and protecting the releasing plates and flanges from the descending billets when the support is released.

385,249. APPARATUS FOR CHARGING BILLETS, BARS, &c., INTO FURNACES. FRED H. DANIELS, Worcester, Mass. Filed Nov. 10, 1887. Serial No. 254,782. (No model.)

Claim.—1. In apparatus for charging heating-furnaces, the combination, with the furnace and the guiding-frame, of a charge-carrier composed of longitudinal beams and transverse supporters, adapted to overhang from said frame when in advanced position, and means for imparting movement to said carrier, to project the load forward into the furnace without contact with the hearth or other portion thereof, as hereinbefore set forth.

2. In apparatus for charging heating-furnaces, the combination of a reciprocating carrier, adapted to support a charge of billets and carry forward the same into a heating-furnace, and an adjustable barrier adapted to be introduced at the rear of the charge of billets, to prevent backward movement of the same when the charging-carrier is withdrawn from the furnace.



3. In an apparatus for charging heating-furnaces, the combination, with the furnace, of the supporting-frame provided with guiding-rolls, the reciprocating carrier-beams having between them rotatable transverse supporters, whereon the billets or charge is placed and supported while advanced into the furnace, and a stop or barrier that engages with the charge and effects the deposit thereof within the furnace, substantially as set forth.

4. In a charging apparatus, in combination with a heating-fur-

nace, a charge-carrier, an adjustable barrier adapted to be introduced at the furnace-entrance in rear of the charge or billets on said carrier, and mechanism for elevating and depressing said barrier into and from the furnace-entrance, substantially as set forth.

5. In a charging apparatus, the combination of an overhanging charge-carrier mounted for reciprocative action, having guides for said carrier, a supporting-frame, and a counteracting guide or roll, as a^5, connected with said frame, for sustaining the rear end of said charge-carrier against upward movement when the charger is projected forward, substantially as set forth.

385,250. APPARATUS FOR CHARGING BILLETS, BARS, &c., INTO FURNACES. FRED H. DANNER, Worcester, Mass. Filed Nov 10, 1887. Serial No. 254,733. (No model.)

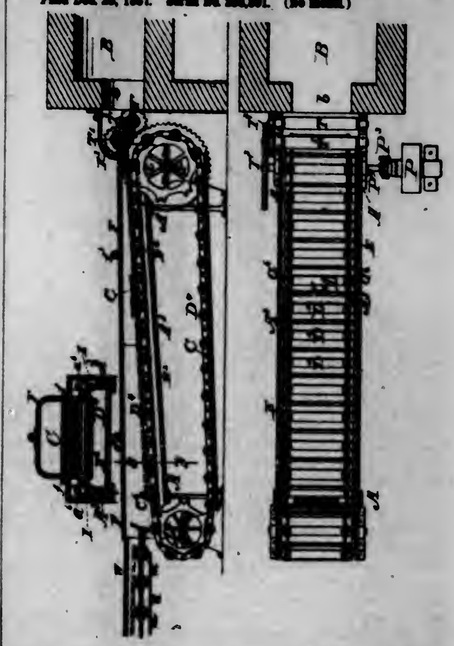
Claim.—1. The combination, with a furnace for heating billets preparatory to rolling them into wire rods, hoops, or other small shapes, of a stationary charging-way provided with a roller table or platform, a carrier running on guides along said way and having a front plate for engaging the rear ends of the billets for projecting them forward, a guide for directing the billets to their place of deposit within the furnace, and means for imparting motion to said carrier, substantially as set forth.

2. In an apparatus for charging billets or bars into a heating-furnace, the combination of a stationary charging-way whereon the billet is received, a movable carrier having a head-plate for projecting the billets forward into the furnace, an operating belt or cable for imparting motion to said carrier, a grip-clutch for connecting and releasing said carrier and cable, and a guide adjacent to the furnace-entrance for directing the billets, substantially as set forth.

3. The charging-way disposed with its platform and guide-bars upwardly inclined toward the furnace-entrance, in combination with the carrier having its traveling rolls mounted on said inclined guides for operation, as set forth, whereby retroctive action is attained by permitting the carrier to roll down the incline after the billet has been projected forward into the furnace.

4. The combination, with a heating-furnace, of an inclined charging-way having charge-supporting rolls and guide-tracks, the carrier mounted to travel on said tracks, an endless cable or operating-band, a grip-clutch for connecting said carrier and cable, a clutch-operating lever, and an automatic trip mechanism for releasing said grip, substantially as set forth.

5. In a charging apparatus, a carrier having a series of recesses or pockets for separately receiving the several billets, in combination with a charging-way and means for advancing said carrier for projecting the billets forward into the furnace.



6. In a charging apparatus, the combination of a charging-way whereon the billets are placed, the carrier C, provided with a series of pockets or depressions, c^3, for engaging and confining the ends of the respective billets, a grooved guiding-roller adjacent to the furnace-entrance, the guiding-spaces of which correspond in alignment with the pockets in said carrier, and means for advancing and retracting said carrier, for the purpose set forth.

7. In a charging apparatus for charging billets into a heating-furnace, the combination, with a charging way or guide, a carrier for projecting the billets forward, and an endless operating-band, of a grip-clutch for connecting and releasing said carrier to and from the driving band, and a retracting weight connected with said carrier for returning it to normal position, substantially as set forth.

8. The charging-way having side flanges, *d*, in combination with the carrier C, having a front plate for propelling the billets or bars arranged to run along the charging-way between said flanges, and a roll having guiding-grooves *f*, for directing the bars into the entrance of the furnace.

9. The combination, with the charging-way and the carrier mounted for traveling forward and backward thereon, of the automatic clutch-releasing device, the retracting-weight, and elastic buffers, substantially as and for the purpose set forth.

385,251. APPARATUS FOR CHARGING BILLETS OR BARS INTO HEATING-FURNACES. FRED H. DANNER, Worcester, Mass. Filed Dec. 29, 1887. Serial No. 259,591. (No model.)

Claim.—1. In billet-charging apparatus, the combination of an endless-belt carrier, whereon the billets are received and supported, having a barrier for projecting the billets forward into the heating-furnace, with belt supporting and actuating wheels, and an operating-shaft, whereby said carrier is propelled by constant forward movement, substantially as set forth.

2. The endless-belt carrier having a series of loosely-revolubie rollers and an abutment or barrier for engaging and advancing the billets, respectively supported by bearings that are linked together as a chain, substantially as and for the purpose set forth.

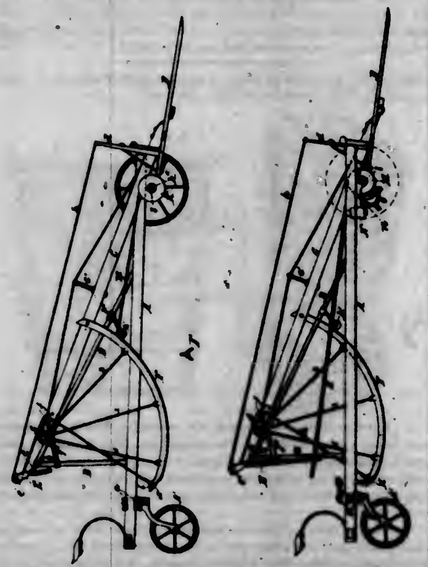
3. The combination, with a heating-furnace, of a billet-charging mechanism consisting of an endless traveling belt or carrier for projecting forward the billets, guide-rolls for directing the billet into the mouth of the furnace, and means for operating said belt, substantially as set forth.

4. In a billet-charging apparatus, the combination of an endless-belt carrier composed of series of bearers or rollers linked together, whereon the billets or bars are supported, and a transverse barrier or flange for engaging and advancing the billets, guiding-rolls, as T T, disposed to direct the billet into the door of the furnace and sustain it elevated from the furnace-bottom, and means for imparting motion to said endless-belt carrier and guide-rolls, substantially as and for the purpose set forth.

5. In a billet-charging apparatus, an endless-belt carrier or charging-way consisting of a roller-belt provided with a barrier or flange for engaging and advancing the billets into the furnace, in combination with a feeder or delivering-way, whereby the billets are delivered onto said carrier, and means for imparting motion to said carrier-belt, for the purpose set forth.

6. In an apparatus for charging billets and bars into heating-furnaces, a hood or cover that incloses the billet or product upon the carrier during the charging operation, for the purpose set forth.

7. In an apparatus for charging billets or bars into a heating-furnace, the combination of a movable carrier, by which the billets are advanced into the furnace, and a stationary hood or cover inclosing said billets while on said carrier, for the purpose set forth.



8. An apparatus for charging billets or bars into a heating-furnace, having a movable carrier, by which the billets or bars are propelled forward, a stationary inclosing-case or boxed frame along the charging-way, and a removable hood for covering said carrier and protecting the product, substantially as set forth.

9. In an apparatus for charging billets or bars, a revolable endless-belt carrier, by which the billets are propelled forward, in combination with guiding-rolls for directing the billets into the furnace, a feeder or delivery-way, whereby the billets or bars are delivered to said carrier, and an inclosing hood or casing, substantially as and for the purpose set forth.

10. The combination, with the delivery-bed and the endless-belt carrier having the barrier C^3, for engaging the product, of an automatically-movable guard disposed at the junction of said delivery-bed and carrier, for the purpose set forth.

11. In an apparatus for delivering and charging billets or bars into heating-furnaces, an inclosed passage through which the billet is delivered for inclosing the product while being delivered upon said carrier, in combination with a charging-carrier provided with a hood or cover for maintaining the heat of the product during the charging operation.

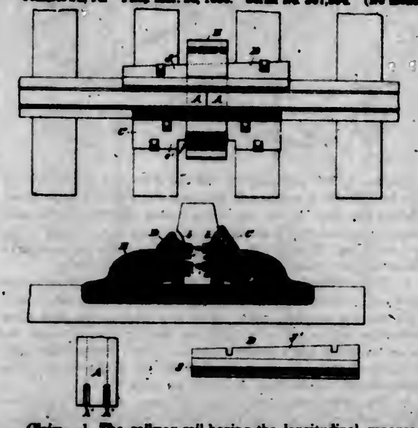
385,252. COMBINED HAY RAKE AND RICKER. REUBEN O. DAVIS, Milan, Mo., assignor to the Standard Manufacturing Company, Dayton, Ohio. Filed June 15, 1888. Serial No. 168,514. (No model.)

Claim.—1. In a combined rake and stacker, the combination of the following elements: a carriage-frame having supporting-wheels and axles, hoisting-arms pivoted to said frame, a rake hinged to the front of said hoisting-arms, a drum with mechanism for locking it to the axle of the carrying-frame and for holding it locked independently of said axle, a hoisting-segment secured to the hoisting-arms and arranged concentric with the pivots thereof, a hoisting-rope connecting the segment and the drum, a tilting and dumping rope secured to the rake-head, and a lever operating on said rope to tilt or dump the rake, substantially as and for the purpose specified.

2. In a combined rake and stacker, the combination of the following elements: a carrying-frame, hoisting-arms pivoted to said frame, a rake hinged to the front of said hoisting-arms, a drum with mechanism for locking it to the axle of the carrying-frame and for holding it locked independently of said axle, a hoisting-segment secured to the hoisting-arms and arranged concentric with the pivots thereof, a hoisting-rope secured at one end to one arm of a bell-crank pivoted at the rear of the segment and at the other end to the drum, and a tilting and dumping rope secured at its forward end to the rake and at its rear end to the other arm of said bell-crank, substantially as and for the purpose specified.

3. The combination, with the arms C, journaled in suitable frames, B B, rake D, hinged to the free ends of said arms, of the rope *h*, lever E, having a sheave journaled in its upper end, segmental guide-rope H, co-operating therewith, drum K, axle *s*, and means for operating said drum.

4. In a combined hay rake and stacker, the combination, with the frame having the supporting-wheels, rotating axle, and pivoted hoisting-arms moved by the axle, of reversing-gearing for changing the direction of movement of said arms at will during the continuous forward rotation of the axle, substantially as described.



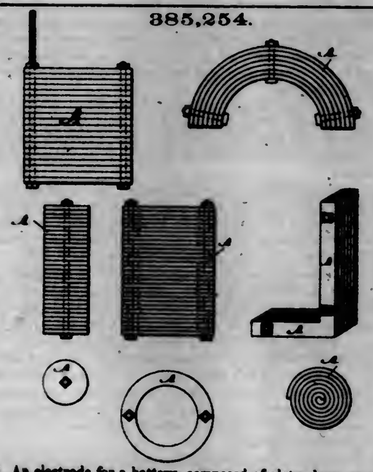
5. In a combined hay rake and stacker, the combination, with axle *s*, drum K, hoisting-rope, and rake hinged to the free ends of suitable pivoted arms, of the bevel-pinion L, having a clutch in its face and fast to the sleeve to which said drum is secured, beveled idle-gear *n*, beveled pinion M, loose on sleeve, reciprocating head T, having counterpart clutch in its end contiguous to pinion L, and having a pawl pivoted to its opposite end, designed to engage a ratchet made in the inner circumference of a circular depression in the contiguous face of pinion M, sleeve *m*, on which said head T reciprocates, secured at its outer end to the contiguous carriage-wheel, axle I, and means for reciprocating said head.

6. The combination, with rake D, arms C, segmental guide F, and hoisting-rope H, of the axle *s*, drum K, pinions L and M, idle-gear *n*, reciprocating head T, collar *w*, fast to axle, sleeve *m*, on which said head reciprocates, axle *l*, and carriage-wheel made fast, the shifter P, bell-crank *e*, and rod S.

7. The combination, with rake D, arms C, segmental guide F, and hoisting-rope H, of the axle *s*, drum K, pinions L and M, idle-gear *n*, reciprocating head T, sleeve *m*, on which said head reciprocates, axle *l*, and carriage-wheel made fast to the end thereof, shifter P, bell-crank *e*, and rod S.

8. The combination, with rake D, arms C, segmental guide F, and hoisting-rope H, of the axle *s*, drum K, pinions L and M, idle-gear *n*, reciprocating head T, sleeve *m*, shifter P, bell-crank *e*, and rod S, the ratchet *r*, made integral with pinion L, pawl r', and rod r^2.

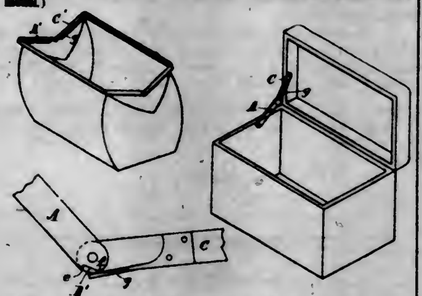
385,253. RAILROAD TRACK AND JOINT. REUBEN S. DORAN, Johnstown, Pa. Filed Mar. 28, 1888. Serial No. 267,894. (No model.)



Claim.—1. The railway-rail having the longitudinal grooves in its web, the concave portions, the shoulders *d'*, and the slots *h'* in the base, in combination with the clamp-plates and clamp-chair, substantially as described.

2. The combination of the rails, the side plate having the vertical flange provided with the ribs *d*, the concave portion, the shoulders *d'*, and the horizontal flange having the double recess, the clamp-plate having the vertical flange provided with the ribs and the shoulders, the horizontal flange tapering on its outer edge, and the clamp-chair provided with the transverse ribs, substantially as specified.

385,254. BATTERY-ZINC. JOHN BOYLE, Hoboken, N. J., assignor to himself, and C. Otto Dannenberg, Lake Mahopac, N. Y. Filed Mar. 19, 1888. Serial No. 268,061. (No model.)



Claim.—1. An electrode for a battery, composed of sheets, plates, bars, or strips having the surface amalgamated with mercury and fastened together, substantially as set forth.

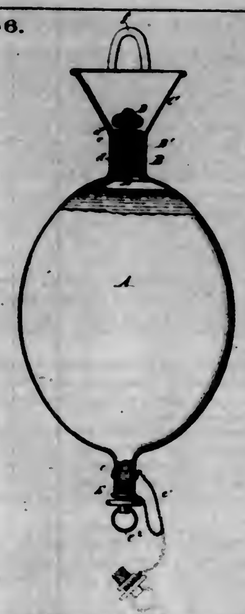
385,254.

2. An electrode for a battery, composed of plates, bars, or strips of metal, the surfaces of which are amalgamated with mercury and placed closely together, in combination with rods passing through holes in the plates to tie the same firmly together, substantially as set forth.

385,255. STAY-HINGE FOR TRUNKS, BAGS, &c. WALLACE DURAND, Newark, N. J. Filed Apr. 6, 1888. Serial No. 269,792. (No model.)

Claim.—1. The combination, with the pivot of a jointed arm, of a cam formed with a rounded surface provided with the single notch D', having the stop *e* at one side, and a jointed arm fitted to the same pivot and provided with a straight spring having its end fitted to the stop *e* at the side of said notch, and adjusted to arrest the movement of the arms when extended, substantially as herein set forth.

2. The combination, with the pivot of a jointed arm, of a cam formed with a rounded surface provided with the single notch D', having the stop *e* at one side, and a jointed arm fitted to the same pivot and provided with a spring having its end fitted to the stop *e* when the arms are extended, and a guard-washer applied to the pivot and operating to cover the notch in the cam and the end of the spring which operates therein, substantially as herein set forth.



3. The combination, with a pair of jointed arms, of a pivot secured in one arm, a cam constructed substantially as described and secured to a square upon such pivot, a spring attached to the other arm and fitted to the notch in the cam, as set forth, and a guard-washer applied to the pivot to cover the notch in the cam and the end of the spring, as and for the purpose set forth.

385,256. STOPPER FOR RUBBER FOUNTAINS, &c. ARTHUR C. BUSHEE, New York, N. Y. Filed Nov. 14, 1887. Serial No. 255,603. (No model.)

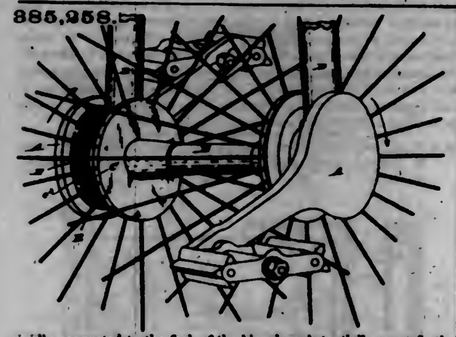
Claim.—The combination, with the neck of a rubber fountain or water-bottle, of an interiorly-threaded re-enforcing sleeve, a funnel

385,256.

extending above said sleeve, and a hollow screw-plug having longitudinal slots or openings, substantially as set forth.

385,257. DINNER-PAIL. F. G. OSCAR BELL, Buffalo, N. Y. Filed Apr. 2, 1888. Serial No. 269,391. (No model.)

Claim.—1. In a dinner-pail, the combination, with a series of superposed pans or vessels, of a cover applied to the uppermost vessel and provided with a handle having hooks or enlargements at its outer ends, and fastening bails or loops pivoted to the lowermost vessel and engaging with the hooks or enlargements of the handle, substantially as set forth.



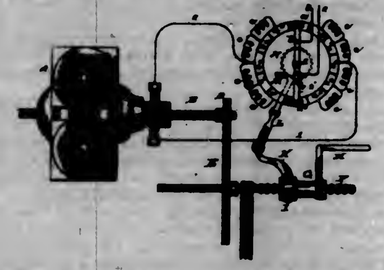
2. In a dinner-pail, the combination, with a series of tapering superposed pans or vessels, of a cover, C, applied to the uppermost vessel and provided with a pivoted handle, D, having hooks or enlargements *d'* at its outer ends, loops or bails E, pivoted to the lowermost vessel and engaging with the hooks *d*, and loops *f*, pivoted to the uppermost or largest of said vessels and adapted to engage with the hooks *d* when the vessels are nested, substantially as set forth.

3. The combination, with the series of tapering superposed vessels and the cover C, applied to the uppermost vessel, of a handle pivoted to said cover and provided with hooks *d* and notches *g*, and loops *f*, pivoted to said uppermost vessel and adapted to engage with the hooks *d* when the handle stands at an angle to the cover and in said notches when the handle is folded against the cover, substantially as set forth.

385,258. VELOCIPEDE. JAMES E. EVANS, Cincinnati, Ohio. Filed Mar. 15, 1888. Serial No. 267,311. (No model.)

Claim.—1. An anti-bender for bicycles, consisting of a ball-clutch or lock located in the cranks, said ball-clutch or lock being

385,258.



rigidly connected to the fork of the bicycle, substantially as set forth.

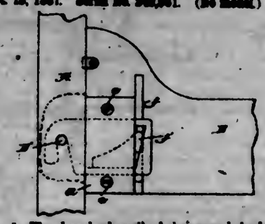
2. An anti-bender for bicycles, consisting of a crank circularly countersunk on its inner face, in combination with a suitable toothed disk in said countersunk portion and balls interposed between the outer wall of the countersunk portion of the crank and the toothed disk, the latter being rigidly attached to the fork of the bicycle, substantially as described.

3. An anti-bender for bicycles, consisting of a circularly-countersunk crank, A, having an outer circular wall, *a*, said wall having a groove, *a'*, therein, in combination with a toothed disk, C, having a groove, *a'*, in its outer face, and suitable balls interposed in said grooves between said wall and disk, the latter being attached to the fork of the bicycle, substantially as set forth.

4. The cranks A, rigidly connected to shaft B, said cranks being circularly countersunk on their inner faces, in combination with circularly-toothed disks C in said countersunk portions, and balls E, interposed between walls *a* and the disks C, lugs *a*, attached to said disks, and screws *c'*, substantially as set forth.

385,259. STEERING APPARATUS FOR VESSELS. BRADLEY A. FISKE, U. S. Navy. Filed Feb. 4, 1888. Serial No. 263,231. (No model.)

Claim.—1. The combination, with an electric motor and a regulating-switch having a movable arm, of a screw turned by the motor, a sleeve on said screw connected with said switch-arm, and a handle for turning said sleeve, substantially as set forth.

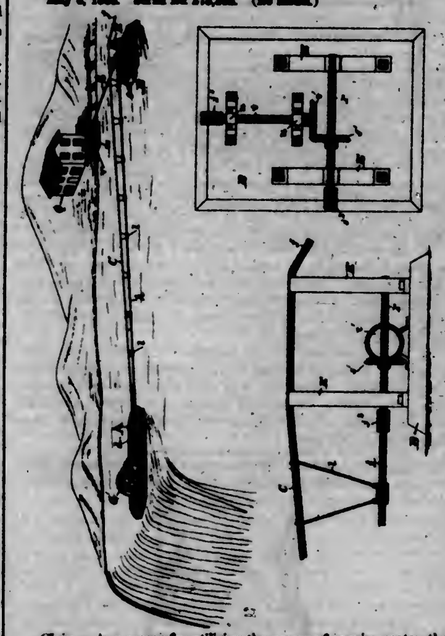


2. The combination, with an electric motor and a regulating-switch having a movable arm at whose normal position a circuit to the motor is broken, while movement to one side or the other closes circuit to the motor in one direction or the other, of a screw turned by the motor, a sleeve on said screw connected with said switch-arm, and a handle for turning said sleeve in either direction, substantially as set forth.

3. The combination, with an electric motor and a regulating-switch having a movable arm at whose normal position a circuit to the motor is broken, while movement to one side or the other closes circuit to the motor in one direction or the other and continued movement increases the speed of the motor, of a screw turned by the motor, a sleeve on said screw connected with said switch-arm, and a handle for turning said sleeve in either direction, substantially as set forth.

4. The combination of an electric motor, a rudder-arm connected therewith so as to be moved thereby in either direction, a regulating-switch having a movable arm, a screw turned by the motor, a sleeve on said screw connected with said switch-arm, and a handle for turning said sleeve in either direction, substantially as set forth.

5. The combination, with an electric motor, of a regulating-switch having a movable arm, a screw turned by the motor, a sleeve on said screw connected with said switch-arm, a handle for turning said sleeve, another sleeve on said screw, and a rudder-arm carried by said last-named sleeve, substantially as set forth.

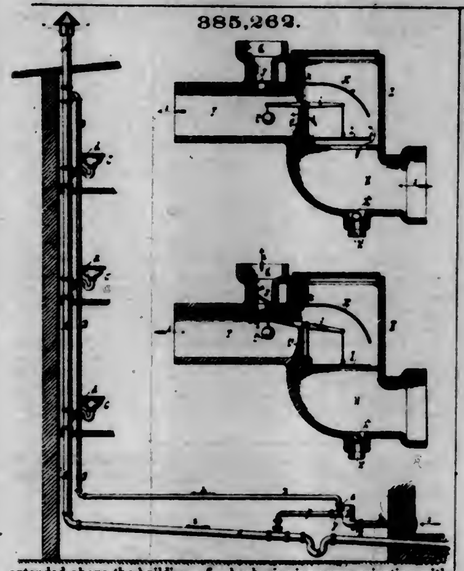


385,260. BEDSTEAD-FASTENER. PETER PETIT, Somerville, Mass. Filed Sept. 12, 1887. Serial No. 249,581. (No model.)

Claim.—1. The herein-described improved bedstead-fastener, consisting, essentially, of the sliding hooked plate having a cam-slot therein, the block *d*, provided with an irregular locking portion, and a locking-slide having a projection to co-operate with the cam-surface of the said hooked plate, substantially as described.

2. The side piece, B, and locking-slide *f* therein, having the projection *f'*, combined with the plate C, having a hooked end, *a*, and an opening, as *b*, having a cam-surface, as *b'*, the said opening being of sufficient length to permit the hooked plate to be thrown back to place its hooked portion *a* within the side piece, as and for the purpose set forth.

385,261. MEANS FOR UTILIZING THE CURRENT FORCE OF RUNNING WATER. CHARLES M. GARDNER, Wichita, Kans. Filed May 5, 1888. Serial No. 273,202. (No model.)



Claim.—As a means for utilizing the power of running water, the combination of a floating vessel, a pier and anchorage, a cable connecting the floating vessel and pier, a screw or wheel on the floating vessel which may be set in motion by the current of running water, a flexible shaft by which the movement of the screw or wheel is transmitted, and hangers suspended from the cable to support the flexible shaft.

385,262. SOIL-PIPE VENTILATOR. JOSEPH HANFIELD, New York, and FLORENCE MCCORMELL, Brooklyn, N. Y. Filed Jan. 12, 1888. Serial No. 260,819. (No model.)

Claim.—1. The combination, with a soil-pipe having its upper open end extended above the building, of a back air-pipe communicating with the soil-pipe above the highest closet or basin, and a ventilating-casing having a valved air-inlet and provided with a passage, F, communicating with the soil-pipe, and a passage, G, communicating with the lower end of the back air-pipe, substantially as described.

2. The combination, with a soil-pipe having its upper open end

385,262.

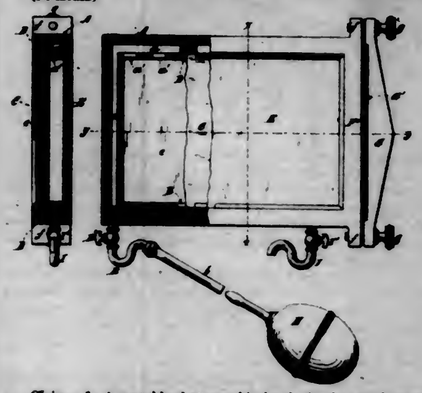
extended above the building, of a back air-pipe communicating with the soil-pipe above the highest closet or basin, and a valve-casing having a valved air-inlet and provided with a passage, F, communicating with the soil-pipe, and a valved passage, G, communicating with the lower end of the back air-pipe, substantially as described.

3. The combination, with a soil-pipe and a back air-pipe, of a valve-casing having an air-inlet and passages F and G, communicating, respectively, with the soil-pipe and back air-pipe, an inwardly-opening valve controlling the air-inlet, and an outwardly-opening valve in the passage that leads to the back air-pipe, substantially as described.

4. The combination, with the soil-pipe A and back air-pipe D, of the casing E, having an air-inlet, H, and provided with passages F and G, communicating, respectively, with the soil-pipe and back air-pipe, an inwardly-opening balanced valve, I, controlling the air-inlet, and an outwardly-opening valve, J, in the passage that leads to the back air-pipe, substantially as described.

5. The combination, with the soil-pipe A and back air-pipe D, of the casing E, having an air-inlet, H, and provided with passages F and G, communicating, respectively, with the soil-pipe and back air-pipe, a valve, I, controlling the air-inlet, a deflector, K, located above said valve, and a valve, J, in the passage that leads to the back air-pipe, substantially as described.

385,263. DUST-COLLECTOR. CHARLES M. HARDENBERGH, Minneapolis, Minn. Filed May 3, 1888. Serial No. 273,260. (No model.)



Claim.—1. A dust-collector comprising an annular expansion-chamber, a separating-chamber arranged below the said expansion-chamber, a series of inclined passages leading from the bottom of said expansion-chamber to the top of said separating-chamber, and a radial inlet-spout connected with said expansion-chamber, substantially as described.

2. The combination, in a dust-collector, of a separating-chamber provided in one end with a discharge-opening for the purified air and at its opposite end with a discharge-opening for the separated dust, an annular chamber arranged over said separating-chamber, a series of inclined passages leading from the bottom of said annular chamber to the top of said separating-chamber, and a radial air-inlet spout connected with said annular chamber, substantially as described.

3. The combination, in a dust-collector, of a circular separating-chamber, a circular casing, 4, connected with the top of said chamber, a tube, 9, arranged within said casing 4, with an annular space between said tube 9 and said casing 4, a series of inclined deflectors, 13, arranged between said tube 9 and casing 4, and dividing said space into a series of inclined passages, all communicating with the top of said separating-chamber, and a radial air-inlet spout communicating with all of said passages, substantially as described.

385,264. PORTABLE PHOTOGRAPHIC DEVELOPING-BOX. THEO. W. HARVEY, Orange, N. J. Filed Feb. 27, 1888. Serial No. 265,413. (No model.)

Claim.—1. A portable photographic developing-box made partly of tinted glass impervious to actinic light, and provided with a tight-fitting removable cover and with pipe-connections for introducing into and withdrawing from the box the liquids used in developing a picture upon a sensitized plate which has previously been exposed in a camera and after removal therefrom placed in the developing-box.

2. A photographic developing-box partly made of transparent tinted glass and adapted to contain a photographic plate, and provided with an internal receiving-chamber having perforations in its inner wall, for the purpose of effecting the simultaneous discharge upon different portions of the plate under treatment of liquid introduced into the said receiving-chamber by means of a suitable pipe connected therewith.

3. A photographic developing-box made partly of tinted glass, in combination with a pipe for introducing into and withdrawing from the interior of said box the liquid employed in the developing process, and an air passage or pipe for letting air escape from the box when liquid is injected into it, and for permitting air to enter the box when the liquid previously therein contained is withdrawn from it.

4. A photographic developing-box made partly of tinted glass and provided with an opening for permitting the introduction into the box of a photographic plate, in combination with a removable cover faced with an elastic material, and a fastening for said cover for securing it to the box and closing the said opening water-tight after said photographic plate has been introduced into the box.

5. The herein-described photographic developing-box, made partly of tinted glass, substantially as and for the purpose set forth, in combination with the liquid-supply pipe B, provided with the stop-cock B', and the air-pipe I, provided with the stop-cock I'.

385,265. CASH INDICATOR, REGISTER, AND RECORDER. CASH B. HOUSUM, Louisville, Ky. Filed July 2, 1888. Serial No. 277,693. (No model.)

Claim.—1. In an indicating mechanism, the wheel provided with the series of movable indicating devices, each provided with an arm or handle by which it can be moved, substantially as and for the purpose set forth.

2. In an indicating mechanism, the wheel carrying a series of radially-movable indicating devices, each provided with a handle by which the wheel can be revolved and the indicating devices can be moved outward on the wheel, substantially as and for the purpose described.

3. In combination with the main portion of the indicator-wheel, the series of slides arranged thereon carrying display or indicator tablets, substantially as for the purpose specified.

4. In combination with the main portion of the indicator-wheel, the series of slides carried thereby, having on their outer ends the marked indicating-plates, and the arms attached to the slides, substantially as and for the purpose shown.

5. In combination with the main portion of the wheel provided with the series of radial slots, as shown, the series of radial slides carrying the display devices, and the arms attached to the slides and playing in the slots in the wheel, substantially as and for the purpose set forth.

385,265.

6. In an indicator, in combination with a rotary wheel, radially-movable indicating devices carried thereon, means for moving such devices on the wheel, and means for locking them against such movement until they are brought by revolution of wheel opposite a certain point, substantially as and for the purpose described.

7. In an indicator, in combination with the rotary wheel and the radially-movable indicating devices carried thereon, provided with arms or handles for moving them, a rigid guide engaging such arms and holding them against movement until they are brought opposite a determined point, substantially as and for the purpose specified.

8. In an indicator mechanism in which the indication is made always at the same point, a rotary wheel carrying movable indicating devices, and means, substantially as described, for locking such devices against movement until they are brought by rotation of the wheel to the indicating or display point, substantially as and for the purpose shown.

9. In an indicator mechanism, in combination with the rotary wheel and the series of radially-movable indicating devices on such wheel, the arms or handles for moving such devices, and a fixed circular guide adapted to prevent these arms moving outward, provided with the offset for allowing outward movement of any of the arms brought around to it by rotation of the wheel, substantially as and for the purpose set forth.

10. In an indicator mechanism, in combination with the rotary wheel, the radially-moving tablet carrying slides and the arms or handles attached thereto, the front of the casing provided with the opening having its edge just outside of the series of arms and provided with the offset or slot, substantially as and for the purpose described.

11. In combination with the circular series of arms or handles for moving the indicator devices, the casing-front provided with the circular opening, and the slot or offset from such opening beveled or inclined at one side, substantially as and for the purpose specified.

12. In an indicating mechanism, in combination with a series of movable tablets adapted to be moved along to bring any desired one of the tablets to a desired point where the same can be raised for display, a record-strip, suitable marking devices on the tablets to mark on the strip numbers corresponding with those on the tablets, and a lever above the tablet-raising point for depressing the record-strip against the marking device on a raised tablet, substantially as and for the purpose described.

13. In combination with the rotary wheel, the radially-movable indicating devices, each provided with marking devices for marking its respective number or mark, arranged upon its outer end, and the pressure-lever, substantially as and for the purpose set forth.

14. In combination with the rotary wheel, the radially-movable slides thereon carrying display devices, each provided upon its outer end with points so arranged as to mark the number or mark which the display device carries, and the lever above the wheel, provided with a yielding cushion on its under face, adapted to press a strip of paper down upon the upper end of any display device which has been raised on the wheel up under the lever, substantially as and for the purpose described.

15. In combination with the wheel provided with the series of radial slots, the radially-sliding rods on each wheel carrying the display devices, pins or arms attached to the rods and extending through the slots, and springs for drawing the rods inward on the wheel, substantially as and for the purpose specified.

16. In combination with the wheel, consisting, essentially, of the two parallel plates provided with corresponding series of radial slots, the radially-sliding rods or bars guided in suitable guides between the plates and carrying on their outer ends display-tablets, springs drawing such rods inward, and pins rigidly connected with the rods and playing in the slots in the plates of the wheel, substantially as and for the purpose shown.

17. In an indicating mechanism, in combination with the wheel and the radially-movable indicating devices thereon, adapted to be brought up to the point of display by rotation of the wheel, means for stopping the rotation of the wheel when the entire series of said devices has been brought to each point in succession, substantially as and for the purpose described.

18. In combination with the indicator-wheel and its pivot-shaft, the pulley on such shaft, the spring, and the cord attached to the spring and to the wheel at a point radially beyond the periphery of the pulley, so that after the wheel is turned forward a certain distance the cord will begin to be wrapped around the pulley, substantially as and for the purpose set forth.

19. In combination with the indicator-wheel, the pulley on the pivot-shaft thereof, the spring attached at one end to a fixed support, and the cord attached to the spring and to the wheel at a point radially beyond the periphery of the pulley, substantially as and for the purpose described.

20. In an indicating and registering mechanism, in combination with the rotary indicator-wheel provided with suitable indicating devices, the registering mechanism connected with such wheel, so as to be operated only as the wheel is turned forward, means for stopping the wheel when the last of the series of indicating devices is brought opposite the indicating-point, means for automatically turning the wheel backward, and suitable stop devices for stopping its backward rotation after the first one in the series of indicating devices has passed the indicating-point, substantially as and for the purpose specified.

21. In combination with the indicator-wheel provided with the fixed pin or stop, the swinging plate I, provided with the rib, and the stop limiting the outward swing of the plate, substantially as and for the purpose specified.

22. In combination with the rotary wheel and the pin on the same, the swinging plate I, having the rib to be engaged by the pin, the stop to limit the swing of the plate, and the spring drawing the plate outward toward the stop, substantially as and for the purpose shown.

23. In combination with the rotary wheel provided with the series of radially-movable indicating devices having pins projecting from the wheel, the swinging plate, a spring tending to keep the plate away from the path of the pins on the indicating devices as such devices are raised to make indications, a rib on the plate, and a pin on the wheel adapted to engage the rib and swing the plate inward across the said path of the pin when the wheel is at its starting-point, substantially as and for the purpose set forth.

24. In combination with the wheel and the radially-movable indicating devices thereon provided with pins, the swinging plate I, provided with rib I^2, the stop for limiting the swing of the plate, and the spring tending to swing the plate against the top and the pin on the wheel, substantially as and for the purpose described.

25. In an indicating mechanism, in combination with the wheel and the series of radially-movable indicating devices thereon provided with pins, a suitable passage-way up which the pins on the indicating devices can pass as such devices are raised to make an indication, the swinging plate adapted to stand across this passage as it is swung inward, a spring to swing the plate outward, and a pin on the wheel engaging a rib on the plate to swing it inward when the wheel is at its starting-point, substantially as and for the purpose specified.

26. In combination with the rotary wheel carrying the radially-movable indicating devices and the pins on such devices, the plate adapted to be swung inward across the way up which the pins on the indicating devices move as such devices are raised on the wheel, a spring tending to swing it inward, a pawl-lever for holding it outward adapted to be engaged by any pin moved up the way and caused to release the plate, the swinging setting-plate adapted to move the former plate outward again, and a pin on the wheel adapted to engage such setting-plate when the wheel is turned back to its starting-point, substantially as and for the purpose shown.

27. In combination with the wheel carrying the series of radially-movable indicating devices provided with pins projecting from the wheel, the pawl in the passage up which the pins are moved as the respective indicating devices are raised, adapted to lock such pins as raised, an alarm mechanism adapted to be tripped by the pins, and means for moving the pawl at will, substantially as and for the purpose set forth.

28. In combination with the plate F and the spring for swinging it inward across the way for the pins on the indicating devices when such devices are raised to make an indication, the pawl-lever crossing such way and engaging and holding the plate normally away from the way, substantially as and for the purpose described.

29. In combination with the rotary wheel and the series of outwardly-movable indicating devices thereon provided with pins, a way or passage up which any of the pins can be moved by raising its respective indicating device and means for closing such way after a pin has been raised up it and lowered again, substantially as and for the purpose specified.

30. In combination with a movable indicating device and the pin thereon, a swinging plate, a spring acting to throw the plate inward across the way up which the pin passes as the indicating device is raised, and a pawl-lever for holding the plate outward from the way, adapted to be struck by a pin passing up the way, substantially as and for the purpose shown.

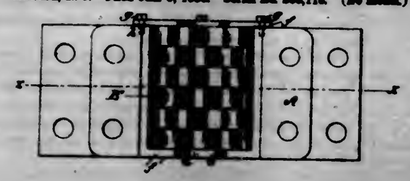
31. In combination with suitable guides, a movable indicating device having a pin or projection adapted to be moved between the guides as the indicating device is moved to make an indication, the swinging plate, the spring pressing it inward, the pawl holding it outward, adapted to be tripped by the pin, the striker carried by the plate, and the bell, substantially as and for the purpose set forth.

32. In combination with suitable guides defining the way for the pin on a movable indicating device, the pawl for holding such pin as raised in the way, the pawl-lever crossing such way, the swinging plate normally held from the way by the pawl-lever, the spring swinging the plate inward across the way when the plate is released, the striker carried by the plate, and the bell, substantially as and for the purpose described.

33. In combination with suitable guides, forming a way between them, the swinging plate adapted when swung inward to bar the way, the spring pressing it inward, the pawl-lever crossing the way, adapted to hold the plate outward, the swinging plate on the other side of the way, having the rib I^2, the stop L, the spring holding such plate outward from the way, the rotary indicator-wheel, and the fixed pin p^2 on the wheel, substantially as and for the purpose specified.

34. In combination with the wheel having the series of radially-moving indicating devices provided with pins projecting from the wheel, the plate having the pawl pivoted thereon and adapted to be brought into position to engage the pins when the plate is moved in one direction, and the pawl pivoted outside of the plate, engaging a pin or stud on the other pawl, and adapted to fall into position to engage the pins when the plate is moved in the other direction, substantially as and for the purpose shown.

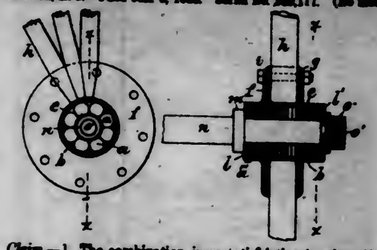
35. In combination with the series of pins, the swinging plate, the pawl pivoted thereon so as to yield in one direction, and the second pawl resting on a stud or pin on the other pawl, all so arranged that as the plate is moved in opposition directions the pawls will be alternately brought into position to engage the series of pins, substantially as and for the purpose set forth.



36. In combination with the swinging plate F, the pawl pivoted thereon, the pawl H, resting on a pin or stud on the former pawl, a spring for actuating the pawl H, and the pawl-lever F, for holding the plate, substantially as and for the purpose described.

37. In combination with the rotary wheel and the radially-movable indicating devices thereon provided with pins, two pawls, one adapted to engage the pins so as to allow forward rotation of the wheel and the other to engage them so as to allow the wheel only to revolve back, and means, substantially as described, for causing the first to act before an indication is made and then throwing the other into action, substantially as and for the purpose specified.

38. In combination with the swinging plate F and the pawl pivoted thereon, the second pawl pivoted outside of the plate and resting against a shoulder or stud on the other pawl, and the spring for actuating the pawl not pivoted on the plate, substantially as and for the purpose shown.



39. In combination with the indicator-wheel, the spring, the cord connected with both the wheel and the spring, and the eccentric pulley rigidly connected with the wheel so as to turn therewith, substantially as and for the purpose described.

385,266. ANTI-FRICTION JOURNAL-BEARING. JOHN W. HYATT, Newark, N. J. Filed Jan. 9, 1888. Serial No. 260,116. (No model.)

Claim.—The combination, in a roller-bearing, of separate independently-rotating series of dimished rolls held in lateral contact in a casing with closed ends, each series of rolls being held in an annular path by the plane of the adjacent series of rolls, substantially as shown and described.

385,267. ANTI-FRICTION JOURNAL-BEARING. JOHN W. HYATT, Newark, N. J. Filed Jan. 9, 1888. Serial No. 260,117. (No model.)

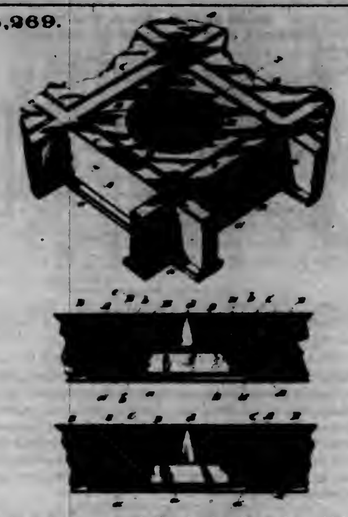
Claim.—1. The combination, in an anti-friction bearing, of a casing formed concentric with the journal, loose disks fitted within the casing around the journal in separate independent series, loose washers surrounding the journal and inserted between the separate series of disks, and means, substantially as described, at the ends of the casing for holding the loose disks in place, as and for the purpose set forth.

2. The combination, in an anti-friction bearing, of a casing formed concentric with the journal, and provided with flanges at its ends, a series of loose washers inserted within the casing around the journal, and separate series of loose disks inserted within the casing alternately with the washers, as and for the purpose set forth.

385,268. ILLUMINATING-TILE. JACOB JACOBS, New York, N. Y. Filed Mar. 17, 1888. Serial No. 267,602. (No model.)

Claim.—1. An illuminating-tile which is composed of a metal plate that is provided with light-openings, glass lenses which are cemented within such openings and have each vertically-parallel sides surmounted by an integral frustum-head that projects horizontally upon all sides and is flat upon its lower side, and cement that is placed upon said plate and caused to fill the space between and beneath the heads of the lenses, substantially as and for the purpose specified.

2. An illuminating-tile which is composed of a metal plate provided with recessed light-openings, glass lenses which are cemented within such openings and have each vertically-parallel sides surmounted by an integral frustum-head that projects horizontally upon all sides and is flat upon its lower side, and cement which is placed upon said plate and caused to fill the space between the heads of the lenses, substantially as and for the purpose shown.

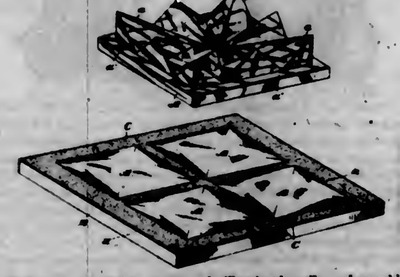


3. As an improvement in illuminating-tiles, the metal body or plate provided with light-openings and having its upper side recessed between such openings, a glass lens which is placed within each opening and has vertically-parallel sides surmounted by an integral frustum-head that projects horizontally upon all sides and is flat upon its lower side, and cement which is placed within and caused to fill the space between the sides of said lens and its opening and between the periphery of its head and the peripheries of the heads of the adjacent lenses, said parts being combined to produce a walking-surface of cement and glass, substantially as and for the purpose specified.

4. The frame-plate provided with light-openings and having rounded ribs upon its lower side between such openings, in combination with lenses which are cemented within said light-openings and have concave lower ends, and troughs that are arranged beneath the lowest portions of said ribs, substantially as and for the purpose shown and described.

385,269. ILLUMINATING-TILE. JACOB JACOBS, New York, N. Y. Filed Feb. 24, 1887. Serial No. 228,703. (No model.)

Claim.—1. An illuminating-tile in which a light-opening is provided with a lens that has a central opening, substantially as and for the purpose specified.



385,269.

2. As an improvement in illuminating-tiles, a lens which is provided with a central opening, substantially as and for the purpose shown.

3. As an improvement in illuminating-tiles, a lens which is provided with a central opening, in combination with a lens that is adapted to inclose the same and to fit into and be secured within the light-opening of a tile, substantially as and for the purpose shown and described.

385,270. ILLUMINATING-TILE AND ROOFING-PLATE. JACOB JACOBS, New York, N. Y. Filed Mar. 19, 1888. Serial No. 267,677. (No model.)

Claim.—1. As an improvement in illuminating-tiles, a lens which upon its lower side is provided with a series of radiating angular ribs, substantially as and for the purpose specified.

2. As an improvement in illuminating-tiles, a lens which upon its lower side is provided with a series of radiating angular ribs that increase in transverse dimensions from their inner ends outward, substantially as and for the purpose shown.

3. As an improvement in illuminating-tiles, a lens which upon its lower side is provided with a series of radiating ribs that increase in transverse dimensions from their inner ends outward and have each an outward and downward inclination, substantially as and for the purpose set forth.

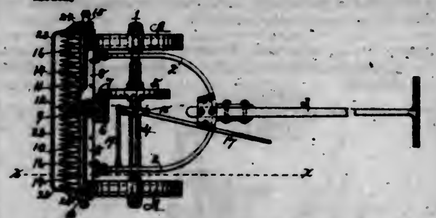
4. As an improvement in illuminating-tiles, a lens which upon its lower side is provided with a series of radiating angular ribs and around and above the outer ends of each rib has a bearing-face, substantially as and for the purpose shown and described.

385,271. ILLUMINATING TILE AND WALL. (On. JACOB JACOBS, New York, N. Y. Filed Mar. 19, 1888. Serial No. 267,678. (No model.)

Claim.—1. As an improvement in illuminating tiles and wall-plates, a lens which upon one side is provided with a series of radial ribs that transversely have curved sides, substantially as and for the purpose specified.

2. As an improvement in illuminating tiles and wall-plates, a lens which is provided upon one side with radial ribs that transversely

385,271.



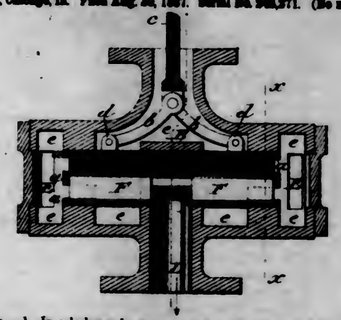
have the form of a pointed arch, substantially as and for the purpose shown.

3. As an improvement in illuminating tiles and wall-plates, a lens which upon one side is provided with radial ribs that transversely have the form of a pointed arch and at their outer ends are curved outward, substantially as and for the purpose set forth.

4. As an improvement in illuminating tiles and wall-plates, a lens which upon one side is provided with radial ribs that transversely have the form of a pointed arch and at their outer ends are ribbed, substantially as and for the purpose shown and described.

5. As an improvement in illuminating tiles and wall-plates, a lens which is provided upon one side with radial ribs that transversely have the form of a pointed arch and at their outer ends are curved outward and ribbed, substantially as and for the purpose specified.

385,272. LAWN-MOWER. HARRY H. JOHNSON, Herkimer, N. Y., assignor of two-thirds to Herbert L. Johnson and Duane C. Johnson, both of same place. Filed Feb. 2, 1888. Serial No. 262,894. (No model.)

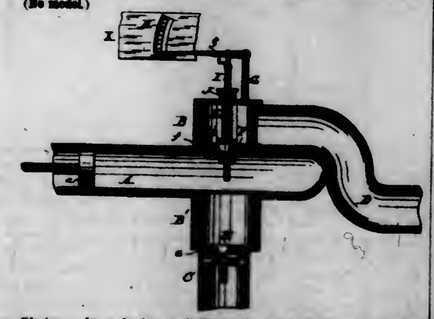


Claim.—1. A lawn-mower consisting of main drive-wheels secured upon an axle, a drive-gear upon the axle, a drive-pinion upon an arbor journaled in a standard erected upon the finger-bar, a disk secured upon the pinion-arbor and provided with a projecting pitman-arbor, an eccentric upon said arbor provided with a pitman-arbor, said pitman-arbors standing diametrically opposite each other, independent pitmen journaled at one end upon the arbors and at the other end to separate knife-bars, a finger-bar slotted longitudinally to receive the knife-bars, the separate knife-bars provided with knives, a knife-guard secured to the finger-bar at its extremities, said guard projecting out beyond the knife-points and horizontally across in front of and above them, clearers arranged at the sides of the guard and connected to it, said clearers being adjacent to the ends of the finger-bar and reciprocating knife-bars, a frame secured to the finger-bar and journaled upon the supporting and driving axle, rollers adjustably mounted in brackets connected to the downwardly-projecting arms of the frame, and a shifting-lever pivoted to a collar loosely mounted on the enlarged portion of the axle and pivotally secured to a rod pivoted to a side of the frame, whereby the frame is adapted to slide a suitable distance upon the contracted extremities of the axle at points situated between the shoulders formed by the enlarged portion of the axle and the hubs of the supporting-wheels, all constructed and operating together, substantially as described and shown, and for the purposes specified.

2. The combination of the finger-bar provided with the guard 23, secured thereto, as shown, said guard projecting out beyond the knife-points and horizontally across in front of and above them, and clearers 24, arranged at the sides of the guard and adjacent to the ends of the finger-bar and reciprocating knife-bars, and connected to the aforesaid guard, and rollers 20, connected to the frame, and the finger-bar with the reciprocating knives, knife-bars sliding in the finger-bar, and pitmen connected to the knife-bars, substantially as described.

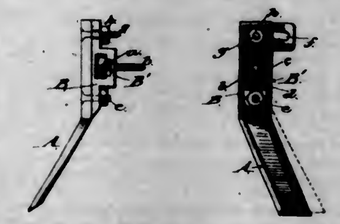
3. The combination of the guard 23, secured to the finger-bar at its extremities, and clearers 24, arranged adjacent to the ends of said finger-bar and reciprocating knife-bars and connected to the guard at its sides, and the finger-bar with the reciprocating knives, knife-bars sliding in the finger-bar, and the pitmen connected to the knife-bars, substantially as described.

4. The guard 23, projecting out beyond the knife-points and horizontally across in front of and above them and secured to the finger-bar, and a clearer, 24, arranged at either side of the guard and adjacent to the ends of the finger-bar and knife-bars, and connected to said guard at its sides, in combination with the finger-bar 8, carrying the knife-bars and knives, substantially as described.



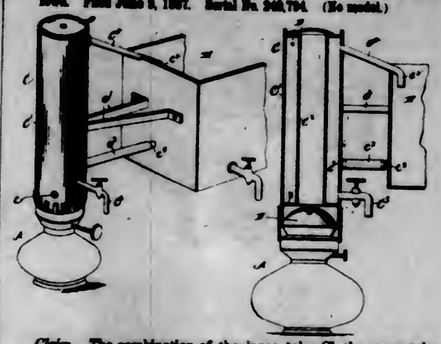
385,273. BALANCED GOVERNOR-VALVE. PHILIP S. KINSLAER, Chicago, Ill. Filed Aug. 20, 1887. Serial No. 248,571. (No model.)

Claim.—1. In a balanced governor-valve, the tubular valves F F, surrounded by steam-spaces *c c*, the links *b b*, and spindle *e*, in combination with the case, all arranged and operated in the manner substantially as shown and described.



2. In a balanced governor-valve, the outer casing, A, inner casing, B, induction-pipe C, eduction-pipe D, side pipes, E E, and valves F F, inclosed in the annular space *c*, when arranged as shown and described, and for the purposes set forth.

385,274. AUTOMATIC WATER-MEASURING DEVICE. WILLIAM LANDERS, Stone Church, Ill. Filed Dec. 20, 1886. Serial No. 222,067. (No model.)



Claim.—In a device to indicate the amount of water passing through a pump, the combination, with the piston and upper and lower valves F, of the standard G, rising from the roof of the chamber of said valve, the index-arm *g*, pivoted to the end of the standard, the scale H, made on the arc of a circle concentric with the pivotal point of the index-arm, the link *i*, pivoted at a suitable point on the index-arm, the rod I, connected by the link with index-arm, and having on its lower end the disk *j*, resting upon but not attached to the valve, and the spring K, surrounding the rod I between the disk *j* and the roof of the valve-chamber, substantially as specified.

385,275. CULTIVATOR-SHOVEL. DANIEL LIMES, Groveport, Ohio. Filed Feb. 20, 1888. Serial No. 265,023. (No model.)

Claim.—The combination, with a cultivator-standard, of the plate B, having the recess *a* and the curved slots *c* and *f*, the headed bolt in the recess projecting through the slot *c* and securing the plate to the standard, and the boot shovel A, pivoted to the bottom of said plate and provided with a bolt, *g*, adapted to pass through the upper slot, *f*, whereby the shovel may be adjusted, and a nut engaging said bolt and securing the shovel to the plate, substantially as described.

385,276. WATER-HEATER. GEORGE W. LOWDEN, Centre Point, Iowa. Filed June 9, 1887. Serial No. 240,704. (No model.)

Claim.—The combination of the inner tube, C', the outer tube, C, connected to the inner tube and forming a water-jacket therewith, an outflow-spigot at the lower end of said water-jacket, a tank, E, arranged to one side of the outer tube, taps *c'*, formed on said tank and outer tube, a pipe, *d'*, fitted on said taps, a pipe, *d*, leading from the upper end of the outer tube over the upper edge of the tank and into the same, and the securing-arms *c'*, projecting laterally from the outer tube, substantially as set forth.

385,277. GAS-STOVE. WILLIAM MOORE, Kokomo, Ind. Filed Jan. 31, 1888. Serial No. 262,802. (No model.)

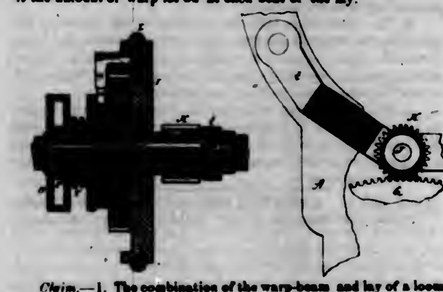
Claim.—1. In a heating-stove, the combination of the following elements, namely: a combustion-chamber, a hollow base arranged beneath the combustion-chamber and forming a part of the passage for the escape of products of combustion from said chamber, flues connecting the upper part of the combustion-chamber with said hollow base, said hollow base being provided with openings which communicate with an exit-flue, a gas-burner arranged within the combustion-chamber with its discharge-opening downward, and a series of tubes arranged beneath said burner and passing through the hollow base, whereby communication is established between the exterior air beneath the base and the interior of the combustion-chamber and the gas-jet is projected against and surrounded by a series of ascending hot-air currents, substantially as specified.

2. In a heating-stove, the combination, with the combustion-chamber, the flues *n n*, the compartment *e* in the hollow base, having openings *r* and forming a part of the passage for the escape of the products of combustion from said chamber, the exit-flue communicating with said openings *r*, and the series of tubes arranged beneath said burner and passing through the compartment *e*, of the compartment *f*, arranged beneath said compartment *e* and having openings *l*, all arranged to co-operate substantially as and for the purpose specified.

3. In a heating-stove, the combustion-chamber D, having lateral extensions *y y*, base B, having compartment *e*, provided with openings *r*, and compartment *f*, provided with openings *l*, hollow columns *n n*, tubes *j*, walls *h* and *o*, having space *p* between them, said space having no opening, *s*, and forming a passage for the escape of the products of combustion, and the gas-supply pipe arranged in said space *p*, and having a burner attached within the combustion-chamber, all combined and arranged to co-operate substantially as and for the purpose specified.

385,278. FRONT-PROTECTOR FOR FOUNDATIONS. ELIAS H. HOGAN, Hillsdale, N. Y. Filed Nov. 12, 1887. Serial No. 254,988. (No model.)

Claim.—1. In a front-protector, the combination, with the foundation A and the sliding sleeve D, resting on the foundation A, of the post



B, provided with the circumferential shoulder *c'* and the plate-piece designed to fit thereon, substantially as specified.

2. In a frost-protector for foundations, the combination, with the foundation A, below the frost-line, of the post B, having the threaded upper end, the plate C, having the threaded opening to engage the threads of the post, and the sleeve D, resting upon the foundation, substantially as specified.

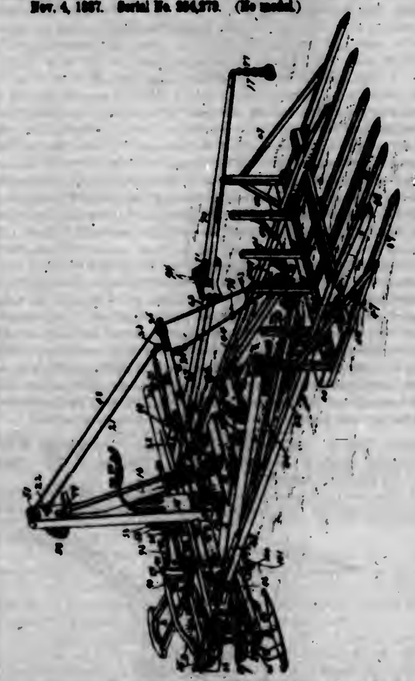
385,279. LET-OFF MECHANISM FOR LOOMS. JAMES HOPKINS, Guttenkill, R. I. Filed Oct. 17, 1887. Serial No. 252,543. (No model.)

Brief.—A bracket pivoted to the loom-frame supports a shaft carrying a spring-actuated drum and a pinion having a disk formed therewith, the drum being provided with teeth to engage a pawl on the disk and the pinion being in gear-connection with the warp-beam. A strap wound about the drum is connected to a lever in the path of one of the lay-swords. At the forward beat of the lay the drum is rotated, winding up the spring within it and communicating motion to the warp-beam. At the return beat of the lay the spring retates the drum reversely, restoring the lever to a position to be again struck by the lay. A tension-bar over which the warps pass is connected to and regulates the position of the lever in front of the lay and through it the amount of warp let off at each beat of the lay.

Claim.—1. The combination of the warp-beam and lay of a loom, the wheel I, the pinion K, concentric with the wheel I, and connected to said wheel I so as to revolve therewith, the said pinion being in gear-connection with said warp-beam, a spring-actuated drum hung concentric with said wheel I, a ratchet, R, concentric with and adapted to rotate with said spring-actuated drum, a pawl on said wheel I, arranged to engage the teeth of the said ratchet, a pulley concentric with and arranged to rotate with said spring-actuated drum and ratchet, a band fixed by one end to said pulley, a lever hung forward of the lay, the free end of said lever adapted to engage with the lay as the lay advances, and a connection between said lever and said band, substantially as and for the purpose described.

2. The combination of the warp-beam and lay of a loom, the bracket *l*, hung to the frame of the loom and so as to swing in a vertical plane, and carrying a shaft, J, the wheel I, and a pinion, K, both on said shaft and connected so as to revolve together, the said pinion K in gear-connection with the warp-beam, the spring-actuated drum O, pulley and ratchet R, arranged loose upon the shaft concentric with said wheel I and adapted to rotate together, a pawl on said wheel I, arranged to engage said ratchet, a lever, *a*, hung forward of the lay, its free end arranged to engage the lay as the lay advances, and a band secured by one end to said pulley and its other end in connection with the said lever *a*, substantially as and for the purpose described.

3. The combination of the warp-beam and lay of a loom, the lever *a*, hung forward of the lay, its free end arranged to engage with the lay as the lay advances, the tension-bar *g*, lever A, carrying said tension-bar, a connection between said lever A and said lever *a*, the wheel I, a pinion concentric with said wheel I and so as to revolve therewith, the said pinion in gear-connection with the warp-beam, the spring-actuated drum O, pulley and ratchet R, arranged to rotate together and concentric with said wheel I, a pawl on said wheel I, adapted to engage the said ratchet R, and a band, one end secured to said pulley and the other in connection with said lever *a*, substantially as and for the purpose described.



4. The combination of the warp-beam and lay of a loom, with the wheel I, a pinion concentric with said wheel I and so as to revolve therewith, the said pinion in gear-connection with the warp-beam, the spring-actuated drum O, pulley, collar *l*, and ratchet R, arranged to rotate together and concentric with said wheel I, a pawl on said wheel arranged to engage the teeth of said ratchet, a friction-spring, *m*, around said collar, one end of said spring in connection with said pawl, a lever, *a*, forward of the lay and with which the lay is adapted to engage in its advance movement, and a band, one end secured to said pulley and the other end in connection with said lever *a*, substantially as described.

385,280. WATER-WHEEL GOVERNOR. JAMES HOPKINS, Guttenkill, R. I. Filed Oct. 31, 1887. Serial No. 253,510. (No model.)

Claim.—The combination of the gate of a water-wheel and a governor, substantially such as described, with a cylinder, a piston in said cylinder, the piston-rod in connection with said gate, a valve-chamber having ports leading therefrom to the respective ends of said cylinder, and also provided with inlet and escape passages, a valve in said chamber adapted to open and close said ports to said chamber or escape, as the case may be, a bell-crank lever, L, and a rod, M, forming connections between said governor and valve, the said rod constructed with a notch, *f*, adapted to detachably engage said lever L, said lever L constructed with a finger, *i*, adapted to disengage said rod from said lever, substantially as described.

385,281. HAY-LOADER. WALTER S. RUSSELL, Hebron, Ind. Filed Nov. 4, 1887. Serial No. 254,579. (No model.)

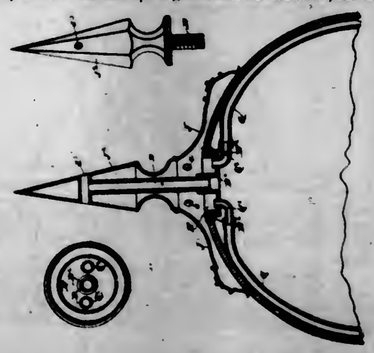
Claim.—1. The combination, with the A-frame 3, of the tongue 6, consisting of the stationary front section, 7, and the movable rear section, 8, having the slanting sides, and the plates 9, secured thereto and having the slotted projecting forward ends, 11, and a pivot-bolt, 10, the said stationary section of the tongue being secured to the A-frame.

2. The combination, with the A-frame 3, supported at its forward end by the privalsi wheel 13 and adapted to be movably secured at its rear end to the axle of the wagon, of the main cross-beam 5, having the hooks 46 on its forward side, the fork hinged on the said

hooks, the large centrally-pivoted evener 26, having at one end a singletree, 32, and having secured to its other end the rope-clutch 33, formed with the enlarged portion 36 and the contracted portion 37, the post 15, the movable brace 18, and the hoisting-rope 48, having the singletree 54 secured to its outer end and formed with a stop, 55, near the said end.

3. The combination, with the A-frame 3, supported at its front end by the swivel-wheel 13, and the main cross-beam 5, having the end blocks, 28, of the tongue 6, consisting of the stationary front section, 7, and the movable rear section, 8, having the slanting sides, and the plates 9, secured thereto and having the slotted projecting forward ends, 11, and the pivot-bolt 10, the centrally-pivoted evener 26, and the bails 30, extending over the same.

4. The combination, with the A-frame 3, having the main cross-beam 5, hooks 46, secured in said cross-beam, and the fork 39, having the eye-plates 45 upon the rear ends of its shank-bars 43, and having the central eyebolt, 50, upon its rear cross-bar, 40, of the post 15, having the roller 51 journaled in its upper end, and the eyebolt 22 upon the forward side of said end, the stop-block 79, and the spring-arms 80, the stationary brace 16, the hinged swinging brace 18, formed with the longitudinal slot 20, and having the roller 25 journaled in its outer end, and the eyebolts upon the upper and lower sides of the said end, the stay-rope 21, and the hoisting-rope 48, formed with a stop, 78, and provided with a pulley-block, 49.

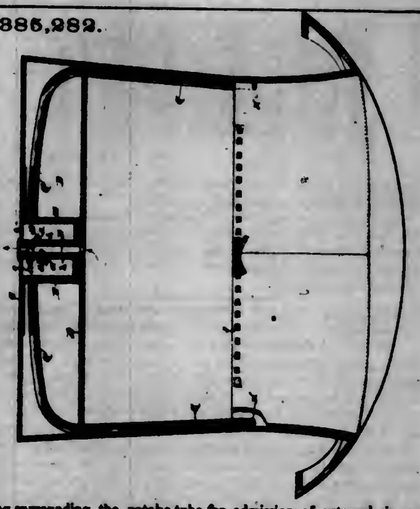


5. In a hay-loader, the combination, with the A-frame, of the rear cross-beam having the bracket secured upon one of its ends, the main cross-beam having the inclined end block provided with a spring-catch, and the front recessed block having a spring-catch, and the adjustable tongue consisting of the rear section having the bracket formed with perforations upon its forward end and the pivoted front section having the perforation in its rear end, and the pin or key, substantially as set forth.

6. In a hay-loader, the combination, with the A-frame having the main cross-beam and the long evener, of the V-shaped drag-frame hinged to the side of the A-frame at its inner end, having the points at its outer ends and the eye upon its center, the connecting-chain, and the hook depending from the evener, substantially as set forth.

7. The combination of the A-frame supported at its front end by the swivel-wheel, having the doubletree pivotally secured beneath it, and having the bails upon its rear ends, the rear cross-beam having the bracket upon its end, the main cross-beam having the front hooks, the straight block upon one end, and the slanting block provided with the spring-catch upon its other end, the tongue consisting of the stationary front section and the movable rear section, the centrally-pivoted evener having the singletree at one end and having secured upon its other end the rope-clutch formed with the enlarged and the contracted portions, the bails extending over the said evener, the removable fork, the post having the roller in its upper end and the front eyebolt, the stop-block, and the spring-arms, the stationary brace, the hinged swinging brace formed with the longitudinal slot and having the roller journaled in its outer end and the upper and lower eyebolts, the stay-rope, the hoisting-rope having the pulley-block 49, and formed with a stop near its inner end, and having another stop formed in it near its outer end, and the singletree secured to the said outer end, the front recessed block having a spring-catch, and the adjustable tongue consisting of the rear section pivoted at its rear end and having the perforated bracket upon its forward end and the pivoted front section having the perforation in its rear end, and the key or pin, all substantially as set forth.

385,282. VENTILATED HAT. MILES POPLEWAITE, Whitehaven, County of Cumberland, England. Filed Jan. 17, 1888. Serial No. 260,970. (No model.)

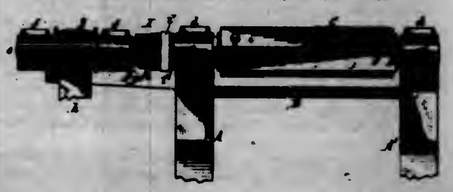


Claim.—1. The combination, with the hat-body, of the uptake or exit tube provided with side openings and internal deflectors, the casing surrounding the uptake-tube for admission of external air, and channels leading therefrom to the interior of the hat, as and for the purposes hereinbefore set forth.

2. The combination, with the hat-body, of the uptake or exit tube provided with side openings and internal deflectors, the casing surrounding the uptake-tube for admission of the external air, and the tubes G, leading from said casing to the lower part of the hat, substantially as and for the purposes hereinbefore set forth.

3. In hat-ventilating apparatus, the combination, with the hat-body and the casing E, for admission of external air, of tubes G, leading from said casing to the lower part of the interior of the hat, with their lower ends shielded or protected from the portion of the hat containing the heated air.

385,283. CONVERTIBLE DRAIN-CLEANER. ERNST J. ROSENDAL, Toledo, Ohio. Filed Dec. 19, 1887. Serial No. 258,302. (No model.)

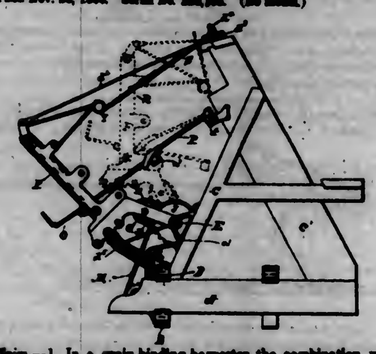


Claim.—1. In a drain-cleaner, a scoop, in combination with a detachable end portion, as and for the purpose set forth.

2. In a drain-cleaner, a scoop, a bail connected therewith, and a removable end portion provided with a bar adjustably connected with the bail, as and for the purpose set forth.

3. In a drain-cleaner, in combination with a scoop, a removable and reversible end portion, as and for the purpose set forth.

4. In a drain-cleaner, a scoop, a removable end portion, in combination with a bail secured to the scoop and having an under-arched portion provided with a dovetail groove in which the end portion is secured, and an upper segmental cogged portion having a handle pivoted thereto and held to any adjustment relatively to the scoop by means of a locking-lever, as and for the purpose set forth.



385,284. WOOD-PLANING MACHINE. JONAH BEEM, Buffalo, N. Y. Filed Feb. 28, 1888. Serial No. 265,801. (No model.)

Claim.—1. In a planing-machine, the combination, with the main frame and a rotary cutter-head provided with spindles mounted in the main frame, of an independent driving-shaft and a universal or yielding coupling, whereby said driving-shaft is connected with one of the spindles of the cutter-head, substantially as set forth.

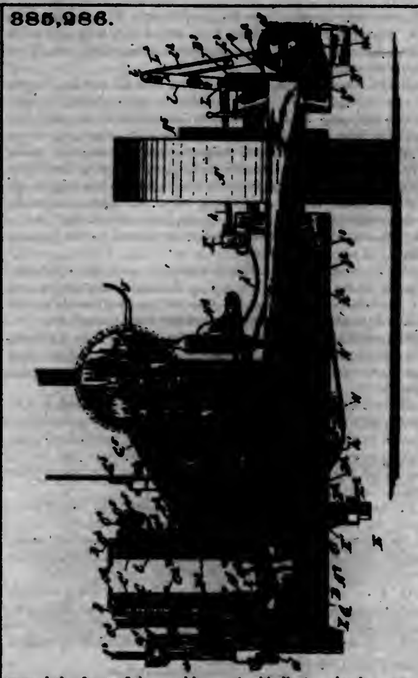
2. In a planing-machine, the combination, with the main frame and a rotary cutter-head or cylinder provided with spindles mounted in bearings in the main frame, of an independent driving-shaft and a universal coupling connecting said driving-shaft with one of the spindles of the cutter-head, and consisting of a sleeve and two connecting-pins secured, respectively, to the ends of the shaft and spindle, and arranged in openings formed in the sleeve, substantially as set forth.

385,285. GRAIN-BINDING HARVESTER. ALEXANDER G. RAMM, Canton, Ohio, assignor to the Pearless Reaper Company, same place. Filed Nov. 29, 1886. Serial No. 220,162. (No model.)

Claim.—1. In a grain-binding harvester, the combination, with the harvester-frame, of a binder-supporting frame having a hinged connection with the harvester-frame at a point outside of the center of the binder and packer actuating shaft, and means for raising and lowering the binder-deck during the progressive movement of the machine, whereby the binder may be raised to pass obstructions or folded over upon the machine and secured in either elevated or depressed adjustment, substantially as set forth.

2. In a grain-binding harvester, the combination, with a binder-frame pivotally secured to a harvester and a packer and binder actuating shaft mounted in said frame, of gearing by which said shaft may be rotated about its own center, while it is moved bodily with the binder-frame as the latter is being moved about its pivot to the harvester-frame.

3. The combination, in a grain-binding harvester, of a binder-supporting frame having a pivotal connection with the harvester-frame, a packer and binder actuating shaft mounted in said binder-supporting frame, a wheel, H, carried by and adapted to rotate said packer and binder shaft, and the wheels I and J, adapted to be rotated about a center corresponding with that of the pivotal connection of the binder-supporting frame with the harvester-frame and geared to wheel H, substantially as set forth.



4. The combination, in a grain-binding harvester, of a pivotal binder-frame and a storm-deck adapted to be contracted and expanded to cover the space over the grain-deck between the binder-frame and the upper part of the harvester-frame as the binder is raised or lowered, substantially as shown, and for the purpose set forth.

5. In a grain-binding harvester, the combination of a pivoted binder-frame and a storm-deck, one end secured to the harvester and the other to the binder, and adapted to be contracted or expanded over the grain-deck with the raising, lowering, or folding of the binder, substantially as set forth.

6. In a grain-binding harvester, the combination, with the pivoted binder-frame, of the expansible storm-deck composed of two sections, one section pivoted to the binder-frame and the other section to the harvester-frame, the said sections having interlocking mechanism, whereby they are connected to each other, so as to slide one upon the other as the binder is folded, substantially as set forth.

385,286. CORN-HARVESTER. GILBERT B. SHAW and JAMES T. SHAW, Sugar Grove, Ill. Filed Apr. 15, 1887. Serial No. 234,973. (No model.)

Claim.—1. In a corn-harvester, the combination, with the cutter, of laterally-moving conveyers arranged in the rear of the same, gathering and carrying chains arranged on each side of the cutter in advance of the same and extending diagonally upward and rearward and then horizontally rearward to a point slightly in the rear of the cutter, whereby the stalks are laid upon the conveyers with their butts

toward the front of the machine, and a binding mechanism arranged to receive the stalks from the conveyers and bundle and bind the same, substantially as and for the purposes specified.

2. In a corn-harvester, the combination, with the main frame and the cutter mounted thereon, of the carrying-chains and their guide-supports, the gathering-arms connected to the guide-supports, and the uprights D^2 secured to the guide-supports and adjustably connected to the main frame by eyebolts d^2, substantially as and for the purposes specified.

3. In a corn-harvester, the combination, with the gathering-arms E, of the gathering-fingers E^2, pivoted to the lower ends of said arms, and the adjusting-bolts *e*, each pivoted near the front end of the gathering-fingers, extending rearward through a suitable lug, *d*, on the end of the gathering-arm E, and provided with adjusting-nuts e^2 on each side of said lug, substantially as and for the purposes specified.

4. In a corn-harvester, the carrying-chains C, arranged on each side of the cutter in advance of the same and extending diagonally upward and rearward and then horizontally rearward to a point slightly in the rear of the cutter, substantially as and for the purposes specified.

5. In a corn-harvester, the combination, with the cutter B, the deck I, the reciprocating conveyers G^2, and the binding mechanism, of the transverse vertical shield G^3, arranged in front of the conveyers and extending from the cutter to the binding mechanism, and the endless-belt butter G^4, arranged in a suitable aperture in said shield, substantially as and for the purposes specified.

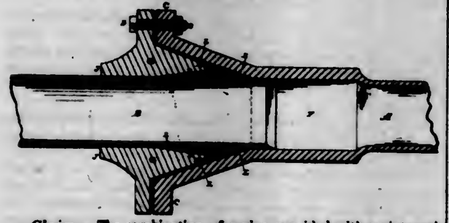
6. In a corn-harvester, a bundle-discharger pivoted on an axis arranged longitudinally of the machine outside of and below the top of the main wheel, the said bundle-discharger swinging vertically in the arc of a circle over the main wheel to discharge the bundle from the machine, substantially as and for the purposes specified.

7. In a corn-harvester, the combination, with a suitable binding mechanism, of a bundle-discharger arranged to receive the bundle as it comes from the binder, actuating mechanism to cause said bundle-discharger to swing vertically in the arc of a circle to discharge the bundle, and a trip-arm arranged in the path of the bundle and actuated by the same to start the actuating mechanism of the bundle-discharger, substantially as and for the purposes specified.

8. In a corn-harvester, the combination, with the bundle-discharger swinging vertically in the arc of a circle and actuated positively during its outward throw, but free to return quickly to its original position by gravity, of spring-buffers arranged to receive the shock of the bundle-discharger as it falls back to its normal position, substantially as and for the purposes specified.

9. In a corn-harvester, the bundle-discharger K, consisting of a bar, K', provided with spring-arms K', an arm, k, to which said bar is attached, and suitable operating mechanism, substantially as and for the purposes specified.

10. In a corn-harvester, the combination, with the cutter, of lateral conveyers arranged in the rear of the same, carrying-chains to gather the stalks and carry them to the cutter and deliver them with their butts to the front of the machine upon the lateral conveyers, a twine binding mechanism to receive the stalks from the conveyers and bundle and bind the same, and the bundle-discharger arranged at the side of the binding mechanism swinging on a longitudinal axis arranged outside of and below the top of the main wheel to receive the bundle from the binding mechanism and discharge the same from the machine at the side over the main wheel, substantially as and for the purposes specified.



11. In a corn-harvester, the combination, with the bundle-discharger K, of the rock-shaft L, carrying the same and provided with arm *l*, the link L^2 to said arm, the disk M^2, mounted loosely on the continuously-rotating shaft M and provided with a crank-arm connected to said link, and a clutch mechanism controlled by a suitable trip to automatically connect and disconnect said disk, and the shaft to operate the bundle-discharger, substantially as and for the purposes specified.

12. In a corn-harvester, the combination, with the shaft M, having collar M' with pins *m'*, of the disk M^2, provided with a crank-arm connected by a suitable link to the rock-shaft of the bundle-discharger, the spring-pawl N, having arms *n* and *n'*, the stop-arm O, and the trip P, connected to said stop-arm, substantially as and for the purposes specified.

13. In a corn-harvester, the combination, with the rock-shaft L, carrying the bundle-discharger K and having arm *l* with pin *l'*, of the disk M^2, having crank-arm M^3, and the link L^2, connected to said crank-arm and slotted longitudinally to receive the pin *l'*, substantially as and for the purposes specified.

14. In a corn-harvester, the combination, with the bundle-discharger K and its rock-shaft L, having arm *l*, of the disk M^2, having crank-arm M^3, and the link L^2, connected to the arm *l* and provided with the adjustable extension L^3, pivoted to the crank-arm, substantially as and for the purposes specified.

385,287. PIPE-COUPLING. JOHN STOUT, Castle Shannon, Pa. Filed June 13, 1887. Serial No. 241,147. (No model.)

Claim.—The combination of a pipe provided with an integral flaring socket at one end and with a cylindrical chamber adjacent to said socket corresponding in internal diameter with the external diameter of the pipe to be joined, said flaring socket being provided with an exterior flange at its outer end, a pipe having a plain end of the same diameter as said cylindrical chamber, an annular compressor having a collar of a diameter to fit the plain-ended pipe and an exterior flange corresponding with the flange of said socket, the inwardly-projecting portion of said compressor being beveled on both its inner and outer faces, the bevel of the outer face corresponding with the flare of said socket for a certain distance from said collar, and being greater near the inner end of the compressor, packing within said socket surrounding said plain-ended pipe, and bolts passing through said flanges for compressing said packing, substantially as described.

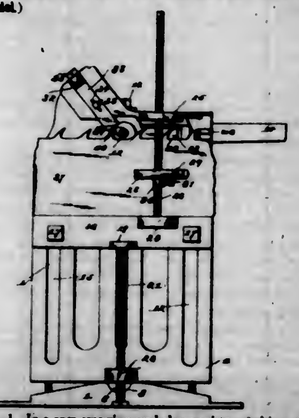
385,288. JOURNAL-BOX. WILLIAM B. TURNER, Schenectady, N. Y. Filed Oct. 14, 1887. Serial No. 252,313. (No model.)

Claim.—1. A journal-bearing having an internal circumferential groove at its middle part, an opening through the bearing from said groove, and spiral grooves or depressions extending from each end to said middle groove, substantially as set forth.

2. A journal-bearing having an internal circumferential groove at its middle part, an opening through the bearing from said groove, and spiral grooves extending from each end to said middle groove, said spiral grooves being filled with soft metal and forming channels for conveying oil along the bearing, substantially as set forth.

3. A journal-bearing having internal spiral grooves or depressions extending from each end to the middle of the bearing, in combination with the lower oil-chamber beneath the bearing, a passage from the middle of the bearing to said oil-chamber, the upper communicating oil-chamber, and a lifting device at each end of the bearing for raising oil from said upper oil-chamber and delivering it to the bearing, substantially as set forth.

385,288.



385,289. SLEIGH-RUNNER. EDWARD K. VAN SICKLEN, Haverstraw, N. Y. Filed Mar. 5, 1888. Serial No. 266,602. (No model.)

Claim.—1. The combination, with the bracket having an outwardly-projecting curved arm provided with a groove or recess, of the T-shaped collar having a lower cylindrical portion fitted in said groove or recess and an upper normally-horizontal portion, and the clip having its ends secured to said collar, substantially as shown and described.

2. The combination, with the bracket having the outwardly-projecting arms, one of which is provided with two opposite ears or lugs integral therewith, of the axle-box having the apertured cheek secured between said ears or lugs, the T-shaped collar having a lower cylindrical portion fitted on one of said arms and having an upper normally-horizontal portion, and the clip having its ends secured thereto, substantially as shown and described.

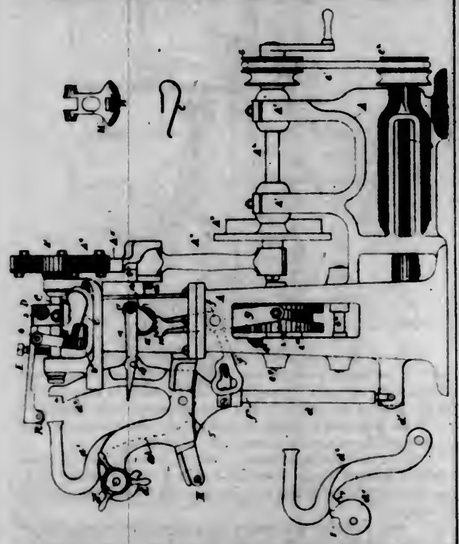
385,290. SAW SWAGE AND SHARPENER. WILLIAM H. WILLIAMS, Huntington, W. Va. Filed Dec. 14, 1887. Serial No. 257,999. (No model.)

Claim.—1. In a saw swaging and sharpening machine, the combination, with the rotted die formed with the cut-away oblong operative end, of the square die cut away at its lower operative end to form the sharp transverse shoulder, substantially as set forth.

2. The combination, with the main frame formed at its upper end with the tubular bearing having the exterior annular groove, of the round die and the handle secured to the outer end of the said die and having the stop-plate, substantially as set forth.

3. The combination of the main frame formed at its upper end with the tubular bearing and the inclined recessed bearing, the square die, and the round die.

4. The combination of the main frame formed at its upper end with the tubular bearing and the inclined recessed bearing, the square die formed with the longitudinal slot, the set-screw and adjusting-screw for the said die, and the round die having the operating-handle, substantially as set forth.



5. The combination, with the main frame formed at its upper end with the tubular bearing, and the horizontal recess opening at its inner end into the forward end of the said bearing, and the inclined recessed bearing, of the square die, the round die having the operating-handle, and the block formed with the curved inner end and having the retaining-screw passing through a slot in the main frame, and the adjusting-screw, substantially as set forth.

6. The combination, with the main frame formed with the longitudinal slots and the bottom lug on its front side, of the transverse bar having the retaining-bolts at its ends and formed with the central lug on its outer side, and cut away along its upper inner edge to form the longitudinal shoulder, and the adjusting-screw, substantially as set forth.

7. The combination, with the main frame formed with the longitudinal slots and the bottom and top lugs on its front side, of the transverse bar having the retaining-bolts at its ends, formed with the two outer lugs, and cut away along its inner upper edge to form the longitudinal shoulder, the adjusting-screw, the rod 26, and the locking-cam, substantially as set forth.

8. The combination of the base formed with the inclined upper side and the central transverse recess, the main frame formed with the wide bottom piece having the end slots and the central bearing, the bottom and top lugs, the longitudinal slots, and the bearings at its upper end, the transverse bar having the end bolts and formed with the longitudinal shoulder and the outer lugs, the adjusting-screw, the rod 26, and the locking-cam, the square die, the round die having the operating-handle, and the adjustable block formed with the curved inner end, substantially as set forth.

385,291. KNEE-PLASTERER. CHARLES J. ABOTT, Malden, Mass., assignor to the Tapley Machine Company, Portland, Me. Filed Feb. 27, 1888. Serial No. 265,502. (No model.)

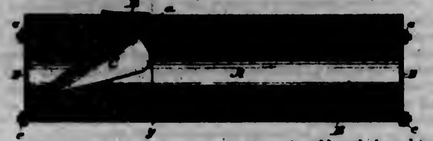
Claim.—1. In a burnishing-machine, the following elements, viz: a burnisher-carrying arm and a rock-shaft to actuate the said arm, a counterbalance-block pivoted to the said burnisher-carrying arm, and a spring to engage the said block and retain it while the burnisher-arm moves outwardly under the action of the varying shape of the heel being treated, substantially as described.

2. The combination, with the arms d^3 d^4 of the jack, of the pivoted goose-neck and the cam for actuating the goose-neck, substantially as described.

3. The jack having a stud or pin, the hook 18, crank 16, and gear 15, combined with the sector-lever and cam to operate it, substantially as described.

4. The jack having an attached roll or stud, as 16, combined with a vibrating arm, as *f'*, having a cam-slot, *f''*, to receive the said roll or stud and raise and lower the jack, substantially as described.

5. The jack having two studs or projections, as 19 and 10, the hook-arm 18, crank 16, pinion 15, and sector-lever 14, having the cam-slotted arm *f'*, combined with a cam to actuate the said sector-lever, substantially as described.



6. In a burnishing-machine, a jack to hold a boot or shoe the heel of which is to be burnished, combined with the cam c^{10}, a lever actuated thereby to raise the jack and permit it to descend at the established time, and intermediate connections between the said lever and jack, whereby the jack is moved automatically in and out, substantially as described.

7. In a burnishing-machine, two shoe-holding jacks and two levers and intermediate connections between them and the said jacks, combined with a cam-wheel to actuate both the said levers simultaneously in opposite directions, each lever and its connections moving each jack independently of the other both in and out under the burnishing-tool and up and down, substantially as described.

8. The combination, with the jacks, of the driving-shaft, the supplemental shaft c^9, the gears, the cam, and the levers, and intermediate connecting devices between the said levers and jacks to throw the jacks in and out, substantially as described.

9. In combination, the two jacks, the cam-wheel, the two levers, and connecting mechanism between them and the two jacks, whereby the jacks are thrown in and out from the machine at different times instead of together, substantially as described.

385,292. DRAIN-TILE. HENRY H. BALDLEY, Assumption, Ill., assignor of three-fourths to Dudley J. Watson, James R. Milligan, and Peter L. Mayer, all of same place. Filed Dec. 28, 1887. Serial No. 258,617. (No model.)

Claim.—1. A drain-tile composed of a series of lengths bound together, and a support having a gate attached thereto clamped in between the ends of two lengths of the series, substantially as described.

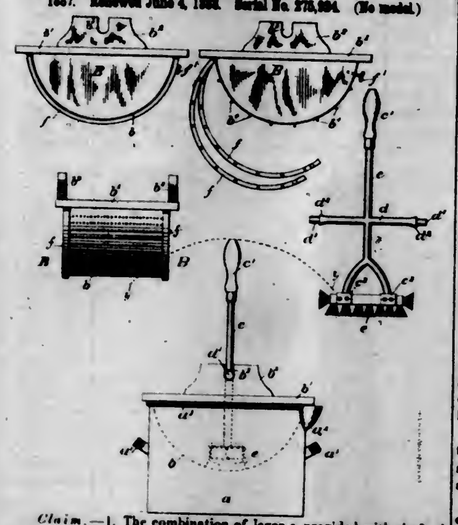
2. The combination, with the two drain-tiles placed end to end and means for binding them together, the opposing end of one tile being recessed, of the gate and the spring-support embracing the tile at one side and fitting in said recess, substantially as and for the purpose described.

385,293. POLICEMAN'S BATON OR CLUB. EDWARD D. BEAN, Arlington, Mass. Filed Aug. 6, 1887. Serial No. 246,269. (No model.)

Claim.—1. A policeman's baton having a body composed of a plurality of layers or pieces of thick firm leather, a core or center consisting of a plurality of flexible wires, a weighted slug in the striking end, and a sling-eye swiveled in the end of the handle, substantially as and for the purpose hereinbefore set forth.

2. A policeman's baton or club having a body composed of leather, a core or center consisting of a plurality of steel wires, a weighted slug, *b*, of metal in the striking end, and the whole covered first with canvas, and finally with leather, as set forth.

385,294. ADJUSTABLE DOUBLE PLOW. ASA A. BILLINGSLEA, Cherry Grove, Ark., assignor of one-half to Alberry Childers. Filed Mar. 30, 1888. Serial No. 267,510. (No model.)

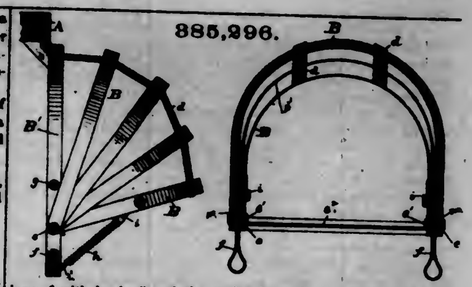


Claim.—1. In a double adjustable plow, as above described, the combination, with the tongue-beam A, cross-beam B, and lock-bar E, of the side bars, C, having the recesses *c*, the plow-standards D, having the solid foot or landside *d*, and perforated arms *d'*, all substantially as shown and described, and for the purposes set forth.

2. The combination, in a plow, as above described, of the recessed plates *c*, slotted plow-standard D, secured to said plates, abutment H, having the mold-board A^2, secured to the front edge of said plow-standard, and plow-point G, having the mold-board *g*, co-operating with said mold-board A^2, substantially as shown and described.

3. The combination, in a plow, as above described, of the tongue-beam A, plow-standard D, having the solid foot or landside *d*, and perforated arms *d'*, said arms one fitting against each side of said beam, collar *j*, fitting over said beam and standard, and bolts *j'*, one passing through the upper perforations and impinging against the upper edge of said beam, and the other passing through the lower perforations and impinging against the lower edge of said beam, substantially as shown and described.

385,295. STRAINER. ARNOLD BOSS, Chicago, Ill. Filed Apr. 19, 1887. Renewed June 4, 1888. Serial No. 276,594. (No model.)



Claim.—1. The combination of lever *c*, provided with shaft *d*, and the brush *e*, with the holding-frame consisting of side walls, B, flange *b'*, and bearing b^3, and the screen *b*.

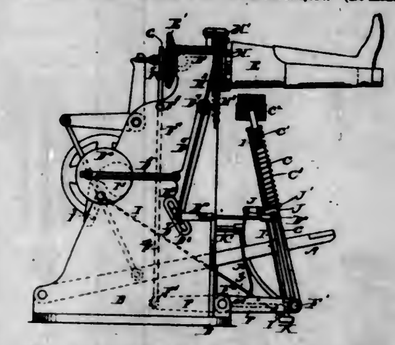
2. The combination of the detachable screen *b* with the holding-frame provided with pins b^4, beads *f*, and the screws *f'*.

3. The combination of the oscillating lever *c*, provided with shaft *d*, and the brush *e*, with the screen *b*, the holding-frame, and the receiving-pan *a*, having lip a^3.

385,296. BUSTLE. VICTOR H. BRUEHMANN, Baltimore, Md., assignor to Augustus H. Brinkmann, same place. Filed Feb. 23, 1888. Serial No. 264,979. (No model.)

Claim.—In a bustle, the combination, with the waistband, the body-bow B', secured thereto, said bow having on each lower end a loop, *f*, with hooks *f'*, and the eyeleted openings *e*, of the series of bows B, the rod e^2, having looped ends *d'*, connecting the ends of the bows B to body-bow B' through said openings *e*, the lower bow, B, having hooks *i*, and the springs A, connecting said hooks *i i'* in an inclined position, as set forth.

385,297. PHOTOGRAPHIC SHEET. ISAAC COHN, New York, N. Y., assignor to Rideout Cohn, same place. Filed Jan. 21, 1888. Serial No. 261,382. (No specimens.)



Claim.—1. As a new manufacture, paper coated with gelatine, shellac, and lamp-black and japanned, substantially as set forth.

2. As a new manufacture, paper coated with shellac and lamp-black and japanned, substantially as set forth.

3. The process herein described, consisting in first coating paper with a solution of gelatine, then drying the gelatine, then applying the coating of shellac and lamp-black, then japanning the resulting product and baking or drying the japan, substantially as described.

4. The process herein described, consisting in coating paper with shellac and lamp-black, then japanning the same and baking or drying the japan, substantially as set forth.

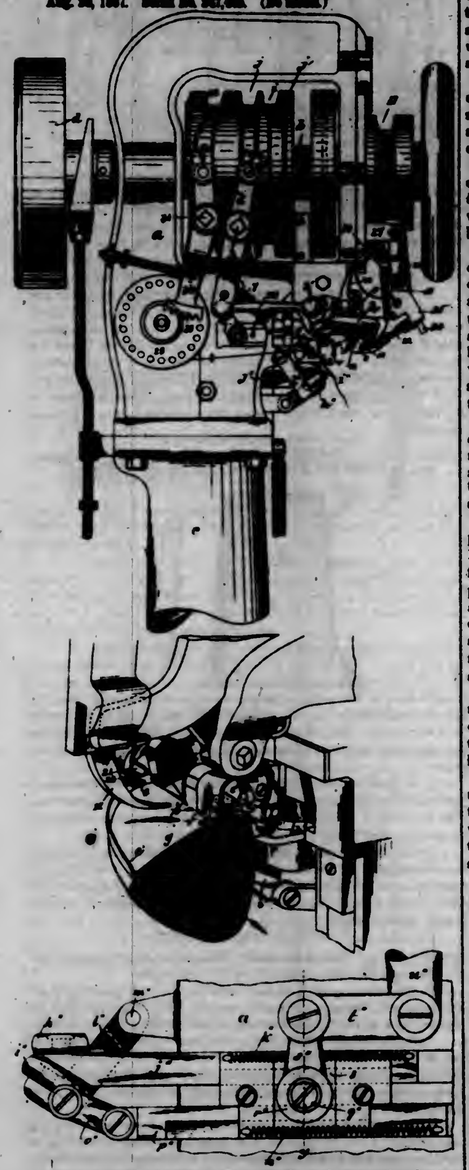
385,298. BOOT-TREEING MACHINE. GEORGE W. COPELAND, Malden, Mass. Filed Apr. 28, 1888. Serial No. 271,657. (No model.)

Claim.—1. In a machine for treeing boots, the combination, with a rotary or oscillating boot-tree and a suitable support therefor, of leg-rubbing tools actuated by mechanism, substantially as described, to rub the boot-leg automatically, said tools operating on the leg portion only, in the manner as described, so that the foot may at the same time be operated upon by hand, substantially as set forth.

2. In a boot-treeing machine, a rotating or oscillating tree, a pattern-cam mounted on the end thereof, a series of leg-rubbing tools, and intermediate connecting and operating mechanisms, substantially as described.

3. In a boot-treeing machine, the pattern-cam G, operating to cause the swinging frame F to follow the contour of a revolving boot-leg stretched upon a tree, substantially as described.

4. In a boot-treeing machine, the crank-disk D^4, connecting-rod D^5, pendulum-lever D^6, and intermediate rod, D^{10}, in combination with the tool-carrying arm C, all substantially as shown and described.



5. In a boot-treeing machine, the combination of the cam H, the lever H', and connecting-rod H^2, with the sliding block D^9 for the slot D^8, operating substantially as described and set forth.

6. In a boot-treeing machine, the combination of the strap I, rocker-arm I^2, and cam F, operating substantially as described.

7. In a boot-treeing machine, the combination of the strap J^2 with the lever J and the swinging frame F, substantially as described, and for the purposes set forth.

8. In a boot-treeing machine, the combination of the latch-lever K^3, latch K^4, spring K^5, and the pin K^6, operating as described, and for the purposes set forth.

385,299. SEWING-MACHINE FOR CHEMICALLY-SOLED AND UPPERS. PIERRE A. GOUAULT and JOSEPH GOUAULT, Boston, Mass., assignors to the Leather Lock Sewing Machine Company, Portland, Me. Filed Aug. 20, 1887. Serial No. 247,465. (No model.)

Claim.—1. The combination of suitable work-supporting devices, a tongue-cutting knife, mechanism to move said knife to and from a sole supported by said work-support, a feeding device to feed the work intermittingly, a curved oscillating needle arranged to enter the incisions made by the tongue-cutting knife, a looper, a cast-off, and tension devices co-operating with said needle, whereby loops of thread are engaged with the tongues cut by the knife, as set forth.

2. The combination of the tongue-forming knife, mechanism to oscillate it, the loop-forming mechanism, the awl arranged to penetrate the outer surface of the shoe, and mechanism for operating the awl, whereby the latter is moved first to penetrate the work, then to withdraw from the work, and finally to return to its starting position, as set forth.

3. The combination of the tongue-forming knife, mechanism to oscillate it, the loop-forming mechanism, the awl arranged to penetrate the outer surface of the shoe, and mechanism to operate said awl, whereby it is caused to feed the work, and the depth-gage, whereby the depth of penetration of the awl and knife is determined, as set forth.

4. The combination of the tongue-forming knife, mechanism to oscillate it, the loop-forming mechanism, the depth-gage adapted to slide horizontally, a spring whereby said gage is normally retracted, and a handle whereby said gage may be moved forward to admit the edge of the upper behind it, as set forth.

5. The combination of the tongue-forming knife, mechanism to oscillate it, the loop-forming mechanism, a normally-yielding rest, as f^7, for the side of the upper, and means, substantially as described, whereby said rest is locked and made rigid during the tongue and loop forming operations, as set forth.

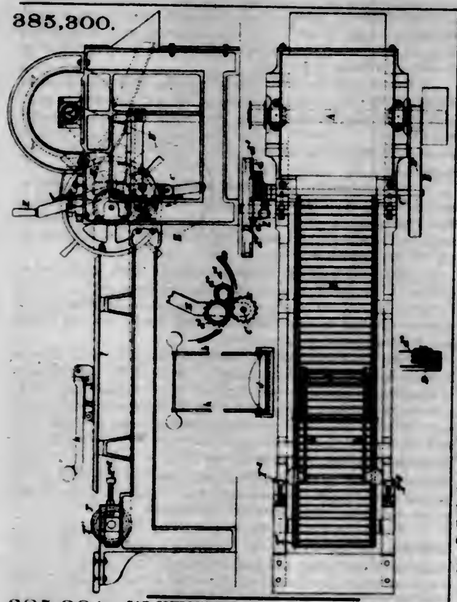
6. The combination of the tongue-forming knife, mechanism to oscillate it, mechanism, substantially as described, for forming loops of thread and interlocking them with the tongues formed by the knife, a normally-yielding spring-projected rest, h^7, arranged to bear on the upper near the sole, a second normally-yielding spring-projected rest, as f^7, arranged to bear on the upper below the other rest, a pivoted lever supporting the rest, whereby the latter is raised and lowered when it is moved forward and back, and means, substantially as described, whereby said rests are locked and made rigid during the tongue and loop forming operations, as set forth.

7. The combination of the tongue-cutting knife, mechanism to oscillate it, the loop-forming and interlocking mechanism, the perforating and work-feeding awl and its operative mechanism, the jaws *s' w'*, adapted the one to penetrate the surface of the sole and the other to support the side of the upper, and mechanism to operate said jaws, substantially as described.

8. The combination, with the feeding mechanism and the complementary stitch-forming mechanism, of the loop-spreader, the slide 13, supporting the same, the lever 14, carrying said slide, mechanism for oscillating said lever, mechanism for reciprocating the slide independently, the cast-off bar journaled in bearings on the loop-spreader and provided with a pinion at one end and a cast-off, 21, at the other end, a rack, 24, adapted to slide in a guide on the loop-spreader, and a connection, 26, between said rack and a fixed support whereby the rack is caused to oscillate the cast-off when the loop-spreader is raised and lowered, as set forth.

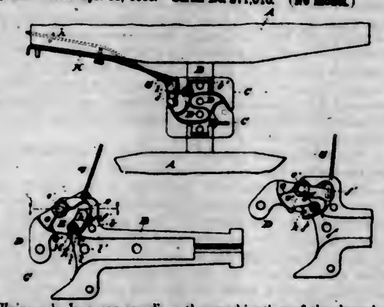
9. The combination, with the tongue-forming and stitch-forming mechanisms, of the depth-gage arranged to bear on the outer surface of the sole, and a pointed dog or jaw formed and arranged to penetrate said surface, and mechanism for oscillating said dog, whereby it is caused to hold the sole against the depth-gage, as set forth.

10. The combination, with the tongue-forming and stitch-forming mechanisms, of the pointed dog or jaw formed and arranged to penetrate the outer surface of the sole, mechanism to oscillate said dog whereby it is caused to enter the sole, and a support, as *w'*, to hold the work against the pressure of the dog when it is penetrating the sole, as set forth.



385,300. FEEDING APPARATUS FOR SCUTCHING OR FIBER-CLEANING MACHINES. ALFRED H. DEATH, Leicester, England. Filed May 4, 1887. Serial No. 237,106. (No model.) Patented in England July 2, 1886, No. 8,703; in France Mar. 15, 1887, No. 182,905; in Spain July 7, 1887, Nos. 6,949/11,096, and in India Aug. 5 and Sept. 16, 1887, Nos. 89 and 1,310.

Brief.—The feed-apron is provided with a clip for holding the material to be treated, and the direction of movement thereof is reversed by a lever pivoted on the shaft of the driving-pinion. This pinion gears with one of two pinions carried by the lever, the two latter pinions being geared together and being provided each with a grooved friction-pulley adapted to engage the grooved internal rim of a wheel mounted on the shaft of one of the apron-rollers. By moving the lever one or the other of the friction-pulleys engages the wheel and imparts thereto a corresponding direction of rotation.



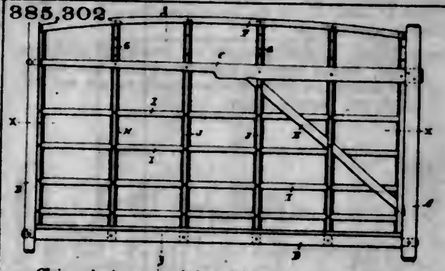
Claim.—1. In a feeding apparatus for scutching or fiber-cleaning machines, the combination of a flexible endless apron, a clip or holder mounted on said apron and provided with side levers, a pair of jaws, one of which is held down by said levers, and mechanism for moving the apron back and forth, substantially as described.

2. In a feeding apparatus for scutching or fiber-cleaning machines, the combination of an apron or carrier, T, the clip or holder H, the side levers, A, hinged to said clip or holder, the transverse jaws J, the upper one of which is held down by said levers, and means for moving the apron or carrier back and forth, substantially as described.

385,300.

385,301. CAR-COUPLING. ROBERT H. DOWLING, Newark, Ohio, assignor of two-thirds to Charles Follett and Charles H. Follett, same place. Filed Apr. 14, 1883. Serial No. 371,010. (No model.)

Claim.—1. In a car-coupling, the combination of the draw-head having the recess for the shank, the coupling-jaw provided with the shank portion having the trunnions thereon, and the crank-arm having the crank portion extending through the draw-head and into an opening in the trunnion provided with the guard to enter the recess, and the operating-bar, substantially as specified.



2. The combination of the draw-head having the recess, the trunnion-bearings and the shoulders, the coupling-jaw having the shouldered shank provided with the curved slot, the trunnions, and the recess for the locking-pin, and the locking-pin having the guard at its lower end and the slotted arm I at its upper end, substantially as specified.

3. The locking-pin having the guard on its lower end and the slot-opening in its outer end, and the slotted arm having its bifurcated end inserted through the slot in the pin and turned in opposite directions, in combination with the draw-head, the locking-jaw, and the operating-rod, substantially as specified.

4. The combination of the draw-bar and draw-head made in two longitudinal sections, the dowel-pins therein, the locking-jaw having the shank portion provided with trunnions, the shoulders, the curved slot *k*, and the recess *k'*, the locking-pin H, extending downwardly through an opening in the draw-head and having the guard thereon to engage the recesses in the openings, and the crank-arm extending through the draw-head into the trunnion and having the guard adapted to engage the recess in the trunnion-opening, substantially as specified.

385,302. PARM-GATE. PHILIP DYER, Umatilla, Mich., assignor of one-half to William Abernethy, Mooretown, Ontario, Canada. Filed Jan. 10, 1888. Serial No. 260,266. (No model.)

385,302

Claim.—1. A gate consisting of the main frame composed of the top and bottom rails, C D, and the uprights A B, secured to and extended above said top rails, the arched bar F, secured to the uprights, the vertical slats H, secured to the top and bottom rails and to said bar F, and the vertical braces G, resting upon the top rail and secured to the portions of the slats H above the top rail, and the said bar F resting on said vertical braces, substantially as shown and described.

2. A gate consisting of the main frame composed of the top and bottom rails, C D, and the uprights A B, secured to and extended above said top rails, the arched bar F, secured to the uprights, the vertical slats H, secured to the top and bottom rails and to the bar F, and the vertical braces G, resting upon the top rail, secured to the portions of the slats H above the top rail and to the arched bar F, and the latticed work composed of the vertical and cross slats J J, secured to the slats H and rails C D and to each other, substantially as shown and described.

385,303. MEASURING-VESSEL. WILLIAM EVANS, Jr., Philadelphia, Pa. Filed Mar. 22, 1888. Serial No. 268,086. (No model.)

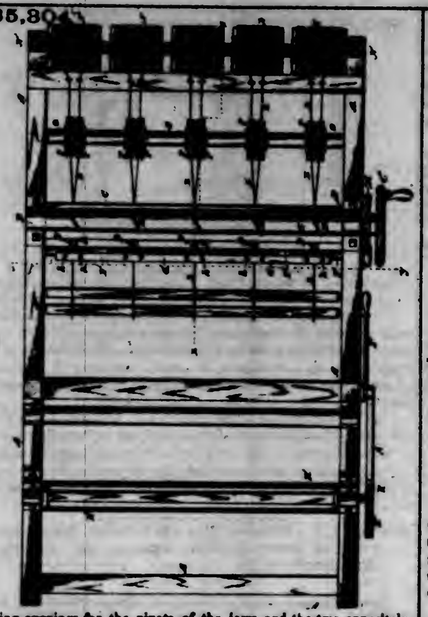
Claim.—1. The body A, having the partition B therein, forming the two chambers *a b*, in combination with the handle C, connected with the walls of both chambers and spouts on the outer ends of the chambers, said spouts constituting enlarged bases, substantially as described.

2. The body A, having the partition B therein, forming the chambers *a* and *b* of different capacities, and the single handle C, connected with the walls of the two chambers, said parts being combined substantially as described.

3. The measure herein described, consisting of the body A, having the partition B therein, forming the chambers *a b* of different capacities, one of said chambers having on its walls the subdivision-mark K and a single handle, C, said parts being combined and arranged substantially as described.

385,304. FENCE-MACHINE. CHARLES F. GILLET, Springfield, Ill. Filed Nov. 30, 1887. Serial No. 256,546. (No model.)

Claim.—1. In a clamp-shuttle for fence-machines, swinging jaws or wings, in combination with cams up over which the jaws ride as they are swung outward, substantially as and for the purpose specified.



2. In a clamp-shuttle for fence-machines, in combination with the two jaws or wings pivoted so as to be capable of an up-and-down as well as a swinging movement, opposite cams adapted to engage the lower sides or ends of the jaws, substantially as and for the purpose shown.

3. In combination with a suitable supporting-frame, two swinging jaws pivoted in the frame so as to be capable of rising and falling as well as swinging, and the two oppositely-inclined cams adapted, respectively, to engage the two jaws as they are swung away from each other, substantially as and for the purpose set forth.

4. In combination with a suitable frame, two jaws pivoted on upright pivots within the frame so as to be capable of rising and falling as well as swinging, and the two opposite cams having inclined surfaces beginning close to the lower ends of the jaws when the latter are swung toward each other, and extending thence upward and outward, substantially as and for the purpose described.

5. In combination with the swinging wings or jaws, the plate

385,304

having openings for the pivots of the jaws and the two oppositely-inclined cams for engaging the jaw ends, substantially as and for the purpose specified.

6. In combination with the swinging jaws pivoted so as to be capable of longitudinal as well as swinging movement, stops to limit the swing of the jaws in one direction and cams to engage and move the jaws longitudinally as they are swung in the other direction, substantially as and for the purpose shown.

7. In combination with a suitable supporting-frame, two jaws pivoted thereto so as to be capable of an up-and-down as well as a swinging movement, the stops to limit the swing of the jaws in one direction, and the opposite cams to engage and cause the jaws to rise as they are swung in the opposite direction, substantially as and for the purpose set forth.

8. In combination with the swinging and rising and falling jaws, springs forcing the jaws downward and opposite cams inclined upwardly and outwardly adapted to engage the lower ends of the jaws as they are swung outward away from each other, substantially as and for the purpose described.

9. In a clamp-shuttle for fence-machines, in combination with a suitable carrying-frame, the series of jaws arranged in pairs and pivoted to the frame so that the two jaws can swing toward and from each other and also have up-and-down movement, and cams on the frame to force the jaws of each pair upward as they are swung away from each other, substantially as and for the purpose specified.

10. In a clamp-shuttle for fence-machines, in combination with a suitable carrying-frame, the series of jaws arranged in pairs and pivoted in the frame so that the two jaws of each pair can swing toward and from each other and also have an up-and-down movement, cams on the frame having inclines up over which the jaws of each pair must ride as they are swung outward from each other, and springs forcing the jaws downward, substantially as and for the purpose shown.

11. In a clamp-shuttle for fence-machines, in combination with a suitable carrying-frame, the jaws arranged in pairs and pivoted in the frame so as to be capable of swinging and also moving bodily up and down, the plates I I, one for each pair of jaws, the steps *i' i'*, and the cam *i² i²* on the plates, and the springs K K, substantially as and for the purpose set forth.

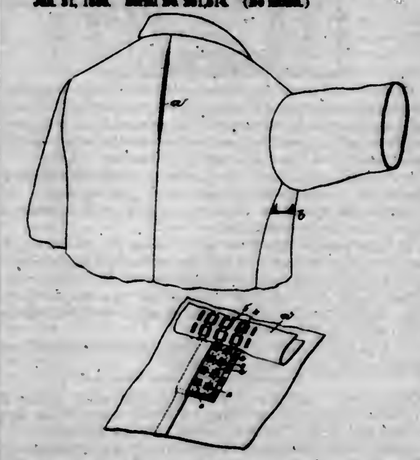
12. In a fence-machine, in combination with a series of twisters and the reels of wire, the shaft and the grooved pulleys fixed thereon, around which the wires are passed on their way from the reels to the twisters, substantially as and for the purpose described.

13. In a tension device for fence-machines, the shaft and the series of grooved pulleys fixed on and rotating with the shaft, substantially as and for the purpose specified.

14. In a tension device for fence-machines, in combination with the shaft, the pulleys thereon, around which the wires are passed, and connections between the shaft and pulleys, allowing the latter to be adjusted along the shaft, but causing them to rotate with it, substantially as and for the purpose shown.

15. In a tension device for fence-machines, in combination with the rotary shaft having the keyway cut along it, the series of tension-pulleys, each having a keyway, and the series of removable keys engaging the way in the shaft and the ways in the respective pulleys, substantially as and for the purpose described.

16. In a fence-machine, in combination with the series of twisters and the reels for supplying wires thereto, the rotary shaft and the grooved pulleys thereon, around which the wires pass on their way to the twisters, fixed to the shaft so as to turn with the same, but to be adjustable relatively along it, substantially as and for the purpose specified.

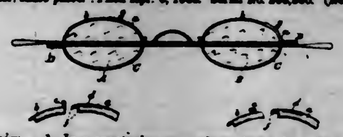


385,305. BOX-LID. WILLIAM D. HARRISON, Pine Bluff, Ark., assignor of one-fourth to John O. Harrison. Filed Apr. 17, 1888. Serial No. 270,970. (No model.)

Claim.—1. The combination, with a box-lid, as above described, of the hinges 5, having the face-pieces 6, edge pieces 7, and extensions 8, roller 11, provided with the pivots 12, working in the perforations in said extensions, said roller adapted to fill the space left between the glasses 3 when the lid is opened, substantially as shown and described.

2. The combination, with a box-lid, as above described, of the hinges 5, having the face-pieces 6, edge pieces 7, and extensions 8, roller 11, provided with the pivots 12, working in the perforations in the said extensions, coil-springs 13, coiled around said pivots 12, their lower ends pressing against the lower end pieces and their upper ends against the upper end pieces, substantially as shown and described, and for the purposes set forth.

385,306. VENTILATED GARMENT. ELLA S. HEWITT, Watertown, assignor of one-half to Daniel W. Crosby, Boston, Mass. Filed Jan. 31, 1888. Serial No. 261,514. (No model.)



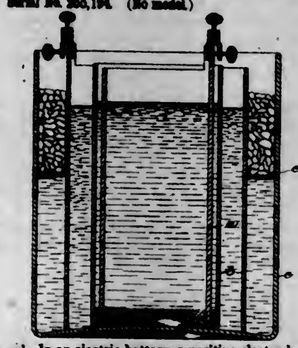
Claim.—1. A garment slitted at the point to be ventilated and having one edge of an independent ventilating-piece presented thereat, the said piece having diagonal air-passages therein and transverse perforations communicating therewith, combined with a perforated lining superimposed upon the said piece and having ribs or projections upon its inner side, substantially as described.

2. A garment having a slit at the point to be ventilated, the piece or portion *c*, provided with several air-passages extending therethrough, one edge of which piece is presented at the slit, and the perforated lining *d'*, having a series of ribs thereon, substantially as described.

3. A garment having a slit at the point to be ventilated, and the piece *c*, having diagonal air-passages 2 and transverse passages 3 com

municating therewith, one edge of said piece *c* being presented at the slit, substantially as described.

385,307. FRAME FOR SPECTACLES OR EYEGLASSES. FREDERICK A. HERRIDGE, Columbia, Mo., assignor of one-half to John Fyfe, same place. Filed Apr. 6, 1888. Serial No. 269,960. (No model.)



Claim.—1. In a spectacle or eyeglass, means for adjusting the frame to suit different sizes of glasses, consisting in a lengthened slot in one end of a severed frame and a tenon on the opposite end carrying a screw-post at right angles to the line of the rim, and a nut for said post to hold the ends of the frame firmly at different points, substantially as described.

2. The combination of the slotted portion *a* and tenon portion *b*, when made separate from and attached to the respective severed ends of a lens-rim, combined with the securing-nut and post, substantially as herein described.

3. The combination, with the slotted end *a* of a lens-frame, of the screw-threaded post formed integral with the part *b*, and the nut *c*, substantially as herein described.

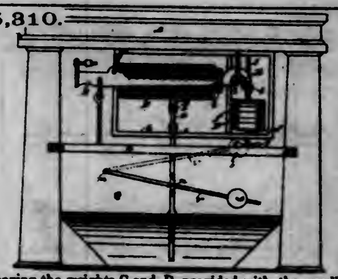
385,308. ELECTRIC BATTERY. HENRY M. HEWETT, Newton, assignor to Daniel W. Crosby, trustee, Boston, Mass. Filed Nov. 15, 1887. Serial No. 255,194. (No model.)

Claim.—1. In an electric battery, a positive electrode or negative pole and a porous cup containing it, composed, essentially, of infusorial earth, combined with an acid-receiving jar or vessel, *c*, and a negative electrode or positive pole interposed between the porous cup and the acid-receiving jar or vessel, substantially as described.

2. In an electric battery, the zinc electrode and the porous cup containing it, combined with the acid-receiving jar or vessel *c*, the copper electrode having a perforated lower part, and the perforated flange *d*, substantially as described.

3. In an electric battery, the acid-receiving jar and the copper electrode, made, substantially as described, to form the crystal-receiving chamber or pocket, and the chamber beneath it, through which the fluid passes, combined with a porous cup contained within the copper electrode and the zinc electrode contained within the porous cup, substantially as described.

4. In an electric battery, a porous cup composed, essentially, of infusorial earth, substantially as described.



385,309. PROCESS OF AMALGAMATING ZINC. HENRY M. HEWETT, Newton, assignor to Daniel W. Crosby, trustee, Boston, Mass. Filed Nov. 15, 1887. Serial No. 255,200. (No specimens.)

Claim.—That improvement in the art or method of amalgamating zinc which consists, first, in coating the zinc with mercury and then subjecting the mercury-coated zinc to the action of water, or a solution containing water maintained substantially at the boiling-point of water, substantially as described.

385,310. WEIGHT-RECORDER FOR WEIGHING-SCALES. JAMES A. JAMIESON, Montreal, Quebec, Canada. Filed Feb. 2, 1887. Serial No. 226,303. (No model.) Patented in Canada Apr. 12, 1887, No. 28,641.

Claim.—1. An automatic weight-recorder for scales, having the frame G, hinged at H and holding the cylinders E and F, the latter being connected through the bevel-wheels K and L and made to turn through the action of the spring *c*, the ratchet-wheel *f*, and the catch

385,310.

g, also having the weights C and D, provided with the needle-points O and N, substantially as described, and for the purposes set forth.

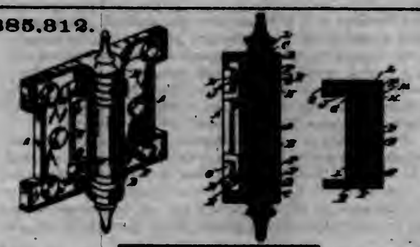
2. An automatic weight-recorder for scales, one part of which is made to swing backward and forward automatically—that is, the frame G and the mechanism contained—through the action of the levers S T V, the vertical piece W, and the bell-crank X, whose end *e* butts against the catch *d* and the spring *c*, in combination, substantially as described, and for the purposes set forth.

3. The combination of the levers S T V, the vertical piece W, the bell-crank X, and the hopper Q with the frame G, the cylinders E and F, the bevel-wheels K and L, the ratchet-wheel *f*, the catches *d* and *g*, and the weights D and C, provided with the needle-points N and O, also the spring *c*, substantially as described, and for the purposes set forth.

385,311. COMBINED SOFA AND SURGICAL TABLE. CHARLES S. JUDY and MARTIN W. FORNEY, Mannsburg, Ohio. Filed Mar. 13, 1888. Serial No. 267,078. (No model.)

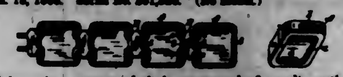
Claim.—1. The combination of the stationary main frame, the vertically-movable frame 5, carrying the table 16, the notched brackets 6, loosely connected with the opposite ends of the movable frame, and two spring push-pins, 9, slidable, respectively, in the opposite ends of the stationary main frame and each having forks 12 and 13, provided at their extremities with keeper-pins 14, engaging the notched brackets, substantially as described.

2. The combination of the stationary main frame, the vertically-movable frame 5, the notched brackets 6, loosely hung to the opposite ends of the movable frame, the push-buttons 9, sliding in the ends of the stationary frame and having pins 14, to engage the brackets, the detachable table 16, having transverse cleats 17, to bear against the insides of the movable frame, and adjustable arm 22, to hold the table in an inclined position on the movable frame, substantially as described.



3. The combination, with the stationary main frame and the vertically-adjustable table 16, having a series of perforations, 20, along each longitudinal edge, of the detachable and reversible pillows 18, having dowel-pins 19, adapted to said perforations, substantially as described.

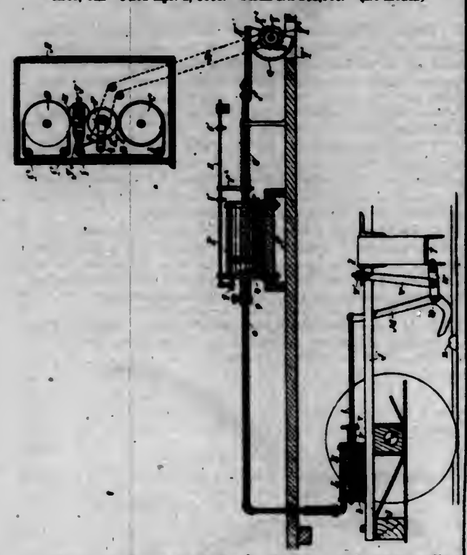
4. The combination of the stationary main frame, the vertically-movable table-carrying frame 5, having the slots 8 in the sides of each end portion, the two pairs of notched brackets 6, each pair connected by a rod, 7, sliding at its ends in said slots, and a sliding push-pin, 9, in each end of the stationary main frame, having forks 12 and 13, provided at their extremities with keeper-pins 14, engaging the notched brackets, substantially as described.



385,312. SPRING-HINGE. HENRY P. KOMMERER, Prospect, Ill. Filed Aug. 5, 1887. Serial No. 246,157. (Model.)

Claim.—The combination, with the hinge-leaves having the projecting pivoted end ears and formed with the bails or bearings at their inner edges, of the tubular casing, the spiral spring, the hook-caps having the recesses or perforations, and the outer hook-pintes connected by the longitudinal rod, substantially as and for the purpose set forth.

385,312.



385,313. BRACELET-CHAIN. GERRARD A. LEWIS, Providence, R. I., assignor to himself and W. B. White & Co., same place. Filed Jan. 19, 1888. Serial No. 261,264. (No model.)

Claim.—An ornamental chain composed of an alternating series of cup-formed links and bar-links, the cup-formed links being provided with the end openings and the intermediate bar-links provided with the oppositely-projecting arms, which enter the openings in the cup-formed links and are bent into holding engagement therewith, substantially as described.

385,314. STATION-INDICATOR. BENJAMIN W. LYON, San Francisco, Cal. Filed Apr. 2, 1888. Serial No. 269,262. (No model.)

Claim.—1. In a station-indicator, the lower and upper winding-drums and the indicating-ribbon attached to each, in combination with the driving-drum for the ribbon, and operating on the periphery of one of the winding-drums, the idler-drum operating between and in contact with the driving-drum and the other winding-drum, and means for operating the driving-drum, substantially as herein described.

2. In a station-indicator, the lower and upper winding drums and the indicating-ribbon attached to each, in combination with the driving-drum for the ribbon, mounted in a swinging bearing and operating on the periphery of one of the winding-drums, the idler-drum mounted in a swinging bearing and operating between and in contact with the driving-drum and the periphery of the other winding-drum, and means for operating the driving-drum, substantially as herein described.

3. In a station-indicator, the lower and upper winding-drums, the swinging driving-drum operating on the periphery of the lower main drum, and the swinging adjustable idler-drum operating between and in contact with the driving-drum and the periphery of the upper winding-drum, in combination with the indicating-ribbon attached at each end to the winding-drums and passing in connection with the driving-drum and the idler-drum, and suitable guide-rollers for directing its course, and an endless chain for operating the driving-drum, substantially as herein described.

4. In a station-indicator, the lower winding-drum, the upper winding-drum, and the indicating-ribbon attached to both, in combination with the pivoted bearing E, the shaft *f* in said bearing, the driving-drum on the shaft, and the chain-pulley and endless chain by which the shaft is rotated, the swinging bearing G, the idler-drum mounted in said bearing, and the adjusting-screw for said idler-drum, all arranged and adapted to operate substantially as herein described.

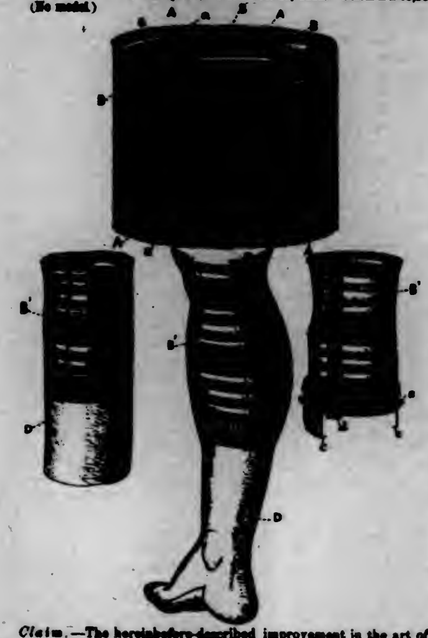
5. In a station-indicator, and in combination with the indicating mechanism, the means for operating it, consisting of a pivoted lever for coming in contact with a fixed lug or obstruction in the road-bed, an air-cylinder supported on the car-trunk, a reciprocating piston therein connected with the lever, whereby it is operated, and connections between said cylinder and the indicating mechanism, by which the air in the cylinder is made to effect the operation of the indicator, substantially as herein described.

6. In a station-indicator, and in combination with the indicating mechanism, the means for operating it, consisting of a pivoted lever for coming in contact with a fixed lug or obstruction in the road-bed, a valved air-cylinder supported on the car-trunk, a piston therein connected with the lever, whereby it is moved in one direction to draw air into the cylinder, springs for returning the piston, whereby the air is forced out of the cylinder, and connections between the cylinder and the indicating mechanism, by which the air is made to effect the operation of the indicator, substantially as herein described.

7. In a station-indicator, and in combination with the indicating mechanism, the means for operating it, consisting of a pivoted lever for coming in contact with a fixed lug or obstruction in the road-bed, an air-cylinder supported on the car-trunk, and reciprocating piston therein connected with the pivoted lever, a second air-cylinder between the first cylinder and indicating mechanism, having the reciprocating piston and communicating with the first air-cylinder, and gearing between the piston of the second air-cylinder and the indicating mechanism, whereby the latter is operated, substantially as herein described.

8. In a station-indicator, and in combination with the indicating mechanism, the means for operating it, consisting of a pivoted lever for coming in contact with a fixed lug or obstruction in the road-bed, a valved air-cylinder adjacent to said lever, a piston therein connected with the lever, whereby it is moved in one direction to draw air into the cylinder, springs for returning the piston, whereby the air is forced out of the cylinder, a second valved air-cylinder between the first cylinder and indicating mechanism and communicating with said first cylinder, a piston therein moving forward under the air-pressure, a spring for returning it to position, and gearing between the piston of the second air-cylinder and the indicating mechanism, whereby the latter is operated, substantially as herein described.

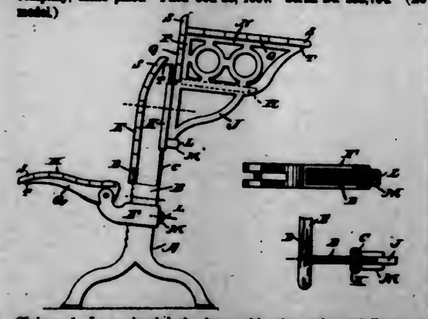
9. In a station-indicator, and in combination with the indicating mechanism, the means for operating it, consisting of the pivoted lever for coming in contact with a fixed lug or obstruction in the road-bed, the air-cylinder on the car-trunk, with the reciprocating piston connected with the pivoted lever, the second air-cylinder on the floor of the car, with reciprocating piston and piston-rod and communicating with the first air-cylinder, a rack on the piston-rod of the second air-cylinder, a gear meshing with the rack, a shaft carrying the gear and having a chain-pulley, and an endless chain from said pulley to the drive-pulley of the indicating mechanism, substantially as herein described.



10. In a station-indicator, and in combination with the indicating mechanism, the means for operating it, consisting of the pivoted lever for coming in contact with a fixed lug or obstruction in the road-bed, an air-cylinder near the lever, with reciprocating piston and piston-rod connected with said pivoted lever, a second air-cylinder between the first cylinder and indicating mechanism, with reciprocating piston and piston-rod and communicating with the first air-cylinder by a pipe, the rack on the end of the piston-rod of the second air-cylinder, a gear meshing with the rack, a shaft on which the gear is loosely mounted, a ratchet on the shaft, and pawls on the gear, whereby they are connected in one direction and are free in the other, a chain-pulley on the shaft, and an endless chain from said pulley, by which motion is transmitted to the indicating apparatus, substantially as herein described.

11. In a station-indicator, and in combination with the indicating mechanism, the means by which it is operated, consisting of a pivoted lever for coming in contact with a fixed lug or obstruction in the road-bed, a valved air-cylinder on the car-trunk, a piston in said cylinder and having a rod connected with the pivoted lever, whereby the piston is moved in one direction, and the springs for returning it, the second valved air-cylinder on the floor of the car, the pipe communicating with the two air-cylinders, the piston in the second air-cylinder and spring for returning it, the piston-rod provided with a rack, the loosely-mounted gear meshing with the rack, the shaft, and the pawl-and-ratchet connection between the gear and the shaft, and the chain-pulley and endless chain by which the power is transmitted to the indicating mechanism, all arranged and adapted to operate substantially as herein described.

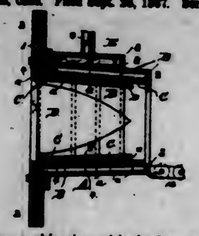
12. In a station-indicator, and in combination with the indicating mechanism, the means by which it is operated, consisting of the piv-



oted lever for coming in contact with a fixed lug or obstruction in the road-bed, a valved air-cylinder on the car-trunk, a piston in said cylinder and having a rod connected with the pivoted lever, whereby the piston is moved in one direction and the springs for returning it, the second valved air-cylinder on the body of the car and communicating with the other air-cylinder, the piston in the second cylinder having a rod, a cut-off valve and connections for operating it, a spring for returning the piston, the rack on the piston-rod, and gearing between said rack and the indicator, whereby the latter is operated, substantially as herein described.

385,315. ART OF MANUFACTURING STOCKINGS. ROBERT HOSLEY and WILLIAM SHERWOOD, Philadelphia, Pa., assignors to Thomas A. Penrce, same place. Filed Dec. 12, 1882. Serial No. 79,869. (No model.)

Claim.—The hereinbefore-described improvement in the art of making stockings, which consists in first cutting, in a line parallel with its axis, from an initial tubular fabric having spiral stripes or patterns thereon, a segment sufficiently large to form the stocking-leg; second, arranging the cut edges of such segment so as to re-form the pattern in annular stripes and then uniting said edges; third, casting onto the needles of a knitting-machine the loops upon one end of the tube thus formed, and, fourth, knitting the remainder of said stocking in the ordinary manner, substantially as set forth.

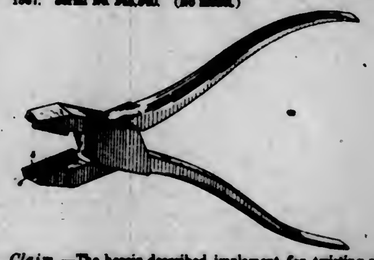


385,316. SCHOOL-DESK. ELI MURRAY, Rushville, Ind., assignor, by direct and mesne assignments, to the Rushville School Furniture Company, same place. Filed Oct. 20, 1887. Serial No. 252,784. (No model.)

Claim.—1. In a school-desk, the combination, substantially as set forth, of standards adapted for attachment to the floor, a seat-bank attached directly to the front edges of the standards, a seat attached to the standards in front of and below the seat-bank, desk-brackets having at their lower front edges open grooves adjustably engaging the rear edges of the standards independent of the seat-bank and seat, and projecting upwardly beyond such engagement, dovetail ribs F upon the said upwardly-projecting front edges of the brackets, a desk-top secured to the tops of these brackets, and a superbank secured to the upper front edges of these brackets.

2. In a school-desk, the combination, substantially as set forth, of standards adapted for attachment to the floor, a seat-bank attached to the front edge thereof, a seat and desk vertically adjustable on the standards, set-screws L, with their points impinging against the rear of the standards, for securing the desk and seat in adjusted position upon the standards, and counterbored bosses M encircling the set-screws.

385,317. LUBRICATING-DIE FOR BRICK AND TILE MACHINES. ROBERT HERRENBRUCK, Chicago, Ill., assignor to Frey, Shoutter & Hoover, Bucyrus, Ohio. Filed Sept. 26, 1887. Serial No. 250,915. (No model.)



Claim.—1. The combination, with the former-casing of a brick-machine having lubricating-ducts through the casing, of a number of detachable frames formed with grooves in their edges and arranged in succession within the casing, a number of metal plates or liners fitted within and held by the said frames, and the impervious plates or aprons arranged to cover the middle parts of the liners, substantially as described, and for the purpose set forth.

2. The combination, with the casing of a brick-machine die having lubricating-ducts, of metal lining-frames arranged within the casing to discharge the lubricant at one of the edges, and impervious plates or aprons D, arranged equidistant in the casing over the main liners, substantially as described, and for the purpose stated.

3. The combination, with the former-casing of a brick-machine, of liners adapted to admit a lubricant between their lapped edges, and impervious plates arranged equidistant from the corners of said liners and laid flat thereon to prevent the flow of the lubricant on the clay, substantially as described, and for the purpose stated.

385,318. IMPLEMENT FOR BENDING WIRE. DANIEL W. HOBBS, Elgin, Ill., assignor to Wesley Young, Dayton, Ohio. Filed Sept. 5, 1887. Serial No. 248,940. (No model.)

Claim.—The herein-described implement for twisting wire or staples, consisting of the two co-operating jaws pivoted together, each of which is provided with a recess or cavity, substantially as described, and a channel for holding one of the legs of the staple, extending from said recess to the end of the jaw, where it terminates in a flared mouth, the recess formed by the two channels when brought together being oblong and having its greatest dimension transverse to the axis of the pivot of the jaws, as set forth.

385,319. PUMP. JOHN HOBBS, Middletown, Conn. Filed Dec. 6, 1887. Serial No. 257,128. (No model.)

Claim.—1. The combination, with the cylinder having opposite water-passages b, opening into the cylinder at opposite ends thereof, of the valve-seat plate having ports, one of which communicates directly with one of said water-passages and the other with the interior of the cylinder, and the semi-annular valves having their ends abutting against guide-pins, substantially as described.

2. A pump having a valve-seat plate located in the end of the cylinder and provided with semi-annular valves lying loosely upon said

385,319.

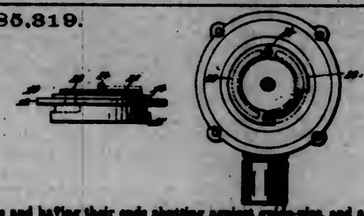


plate and having their ends abutting against guide-pins, and a piston-rod passing centrally through the valve-seat plate, substantially as described.

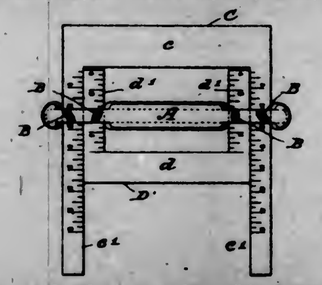
385,320. ENVELOPE-TABLET. HIRAM PHILLIPS, Columbia, assignor to Kirtley & Phillips, Boone County, Mo. Filed Nov. 3, 1886. Serial No. 217,573. (Model.)

Claim.—1. An envelope-package consisting of the following elements, to wit: the envelopes provided at one edge with a gummed backing and a stiff cover hinged thereto and freely moving thereon, and a thin cover hinged to the backing on the opposite side of the stiff cover, passing around the bottom and front edge, and having a blotter attached to its edge, so as to be freely moved thereon.



2. A package of envelopes gummed and secured at the rear edge to a backing, *b*, and also at its front edge gummed and secured to a retaining-piece, *b'*, whereby the package is held securely together in a very compact form.

3. In combination with a package of envelopes secured together at the front and rear, but so that each envelope can be easily separated from the pack, a hinged cover or piece adapted to be turned down in front and afford a hand-rest when addressing the envelope.

4. An envelope-package provided with a wrapper to which it is attached at the front and rear edges, and whereby it is completely surrounded and protected from dust, &c., at all points except at the side edges, substantially as described.

5. The envelope-package provided with a hand-rest to aid in addressing the envelopes, and also with a blotter, substantially as described.

385,321. CARPENTER'S FRAMING-GAGE. LEANDER P. PERKINS, Rochester, assignor of one-fourth to Frank W. Yeaton, Concord, N. H. Filed Jan. 18, 1886. Serial No. 281,606. (No model.)

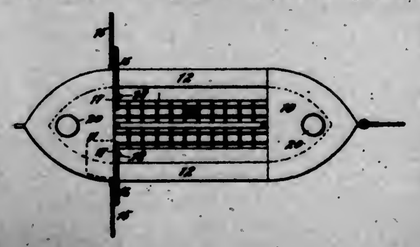
Claim.—1. In a framing-gage, the parallel adjustable frames adapted to fit one within the other and both capable of adjustment within a cross-head, the said cross-head having openings for receiving said frames, and suitable screws threaded therein for securing the same, all substantially as and for the purpose set forth.

2. In a framing-gage, the parallel adjustable frames graduated to inches and fractions, as shown, and adapted to fit one within the other and both capable of adjustment within a cross-head, the said cross-head having openings for receiving said frames and suitable screws threaded therein for securing the same, substantially for the purpose explained.

385,322. REVERSING MECHANISM FOR KNITTING-MACHINES. HARRY C. EISENBRAUN, Philadelphia, Pa., assignor of one-half to Thomas A. Penrce, same place. Filed May 24, 1887. Serial No. 238,551. (No model.)

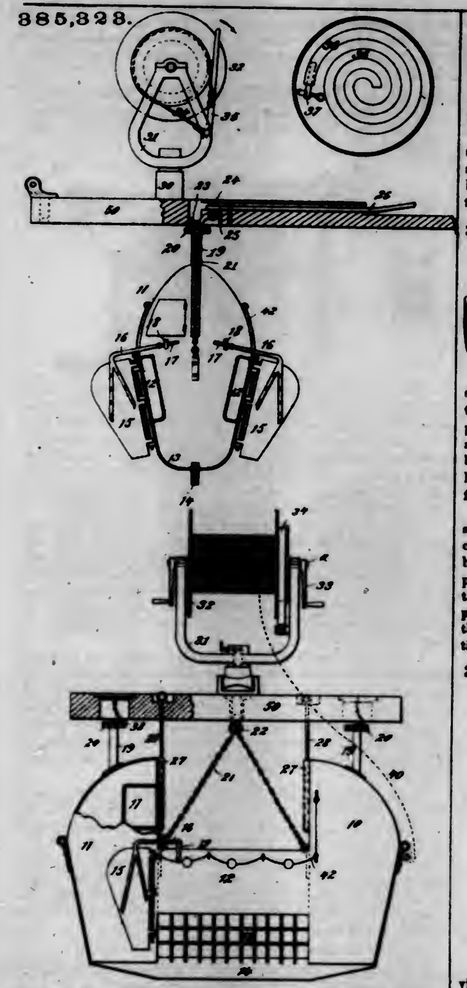
Claim.—1. The combination of a shaft, a pair of wheels running freely thereon, gearing, substantially as set forth, whereby said wheels are revolved in opposite directions, a pair of disks which engage with said wheels, respectively, by an elastic coupling device, and each of which is provided with a slot, a cylinder rigidly attached to said shaft between said disks, and a bolt sliding longitudinally in said cylinder and of sufficient length when flush at one end with the end of the cylinder to enter the opposite disk-slot and engage therewith.

2. The combination, with the hereinbefore-described reversing mechanism, consisting of a pair of oppositely-running wheels loosely mounted upon a shaft, slotted disks coupled to said wheels, as described, an intermediate cylinder rigidly attached to the shaft, a bolt adapted to couple either of said disks to said cylinder, and a pin projecting from said slot, of a pair of oppositely-inclined cams arranged in the path of rotation of said pin, substantially as and for the purpose set forth.



3. The combination, with the hereinbefore-described reversing mechanism, consisting of a pair of oppositely-running wheels loosely mounted upon a shaft, slotted disks coupled to said wheels, as described, an intermediate cylinder rigidly attached to the shaft, a bolt adapted to couple either of said disks to said cylinder, and a pin projecting from said slot, of the pivoted cam-carriers *e* and *f*, whereby either or both of the reversing-cams may be thrown out of play, substantially as set forth.

4. The combination of the shaft C, bevel-gear I, bevel-gears G and H, having in their faces slots *g e*, respectively, disks K L, having pins which enter said slots, and springs *l p*, bearing therein, and having also arc-shaped slots *g h*, the cylinder J, rigidly secured to the shaft and having the longitudinally-movable bolt *d*, adapted to enter either of said slots *g h*, the pin *r*, attached to said bolt and projecting through a slot in the periphery of the cylinder, and the cams *n m*, arranged in the path of rotation of said pin, the whole operating substantially as and for the purposes set forth.



385,323. REEL LIFE-BUOY. ARMSTEAD REID, U. S. Navy. Filed Jan. 21, 1887. Serial No. 225,032. (No model.)

Claim.—1. The combination, with the vessel having a swiveled frame and a reel carried thereby, of the vertically-swinging buoy-supporting hook pivoted to the vessel below the reel, the horizontally-movable releasing-lever pivoted to the vessel and having a hook or projection engaging a leg or arm on the hook, the life-buoy suspended over the vessel's side by the said hook, and the line or cable connecting the reel and buoy, substantially as set forth.

2. The combination, with the vessel, the buoy, and the suspending and releasing mechanism, of a signal composition or material carried by the buoy, and an igniting device connected with the vessel and with the said signal, whereby when the buoy falls the signal will be

385,323.

ignited by the severance of the connection between it and the vessel, substantially as set forth.

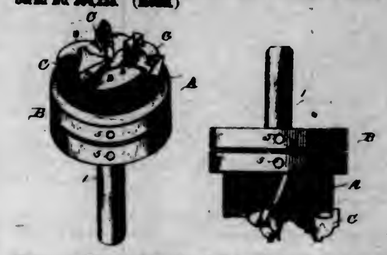
3. The combination, with the vessel, the platform extending beyond the edge thereof, and having a reel and a supporting and releasing mechanism, of the buoy having the port-fire box containing a coil signal-fire provided with a friction-primer, and a cover for the box connected to said primer and secured by a lanyard or chain to the platform, whereby when the buoy is released and falls the cover will be pulled off and the friction-primer operated to ignite the coil, substantially as set forth.

4. The combination, with the vessel having a platform, 50, the reel, the buoy suspending and releasing mechanism, and apertures provided with removable covers, of the buoy suspended beneath the platform and provided with port-fire boxes below said platform-apertures and containing coils of signal-fire provided with friction-primers, covers for the said boxes connected to said primers, and chains or lanyards connecting the aperture-covers with the port-fire covers, whereby the covers may be removed and the friction-primers disconnected during the day, substantially as set forth.

5. In a life-saving buoy for vessels, a port-fire box to be carried by the buoy and having a coil of fire provided with friction-primer, and a cover for the box, to which the coil is connected, the said cover being adapted to be connected with the vessel and removed by the falling of the buoy to ignite the coil, substantially as set forth.

6. The combination, with a vessel having a reel and a buoy suspending and releasing mechanism, of a buoy, a line leading from the reel to the buoy, and rearward-swinging fins normally held extended at the sides of the buoy, and means for releasing the fins to allow their free ends to swing rearward, whereby when the buoy falls into the water the extended fins will cause the line to unwind from the reel without moving the buoy forward, and said fins may be released and allowed to swing rearward when the occupant desires the buoy to be drawn to the vessel, substantially as set forth.

7. The combination, with a life-buoy, of fins 15, hinged to the sides of the buoy to swing rearward, arms 16, extending inward from said fins, hinged catches 17 on the inner ends of the said arms, and keepers 18 on the buoy, with which said catches are in engagement to normally hold the fins extended, substantially as set forth.

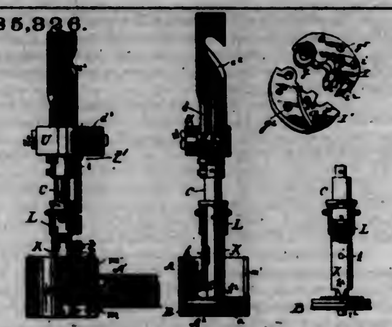


385,324. DIBBLE. THOMAS SELLER, Versailles, Ky., assignor of one-half to Wesley Young, Dayton, Ohio. Filed Sept. 5, 1887. Serial No. 248,849. (No model.)

Claim.—1. In the herein-described dibble, the combination of the straight-pointed blade substantially diamond shape in cross-section, the straight handle, and the socket having the central downwardly-projecting lugs D, embracing the blade at the center on either side, and the arms E, made integral with said socket and extending outward beyond the edges of the blade, forming foot-rests for the operator, lying on and supported by the top of said blade, substantially as and for the purpose set forth.

2. In the herein-described dibble, the combination, with the straight handle having the socket on its lower end provided with the central downwardly-projecting lugs embracing the flat portion of the blade on each side, and the laterally-projecting arms forming foot-rests projecting beyond the edges of the blade formed integral therewith, the blade substantially diamond shape in cross-section with its upper part flattened and tapered to form the shank, and the rivet passing through the socket, handle, and shank for uniting the parts, substantially as and for the purpose set forth.

385,325. CUTTER-HEAD. GEORGE S. SMITH, Milton, Pa., assignor to Samuel J. Shiner & Sons, same place. Filed Feb. 16, 1888. Serial No. 264,228. (Model.)



Claim.—1. The combination of the cylindrical head-stock provided with screw-threads on its circumferential face and formed with bit-slots extending longitudinally for its length, bits disposed in said slots, having shanks formed with lugs projecting beyond the face of the head-stock, and threaded clamping-rings fitted to the head-stock to engage the threads on the head-stock and clamp the projecting lugs of the bits in opposite directions, substantially as described, and for the purpose specified.

2. The combination of the cylindrical head-stock provided with screw-threads on a circumferential face and formed with bit-slots longitudinally arranged, bits having shanks formed with double-inclined projections extending beyond the face of the head-stock, and threaded clamping-rings having chamfered inner edges fitted to the head-stock to engage the threads on the head-stock and clamp the faces of the double incline of the bits, substantially as described, and for the purpose specified.

3. The combination of the cylindrical head-stock provided with screw-threads on its circumferential face, and formed with bit-slots and having inclined sections on its under face, bits having shanks formed with double-inclined projections, and threaded clamping-rings having chamfered inner edges fitted to the head-stock to engage the threads on the head-stock and clamp the faces of the double incline of the bit-shanks, substantially as described, and for the purpose specified.

385,326. PILL OR LOZENGE MACHINE. GEORGE A. SMITH, Norristown, assignor to Smith & Caldwell, Philadelphia, Pa. Filed June 18, 1887. Serial No. 241,770. (No model.)

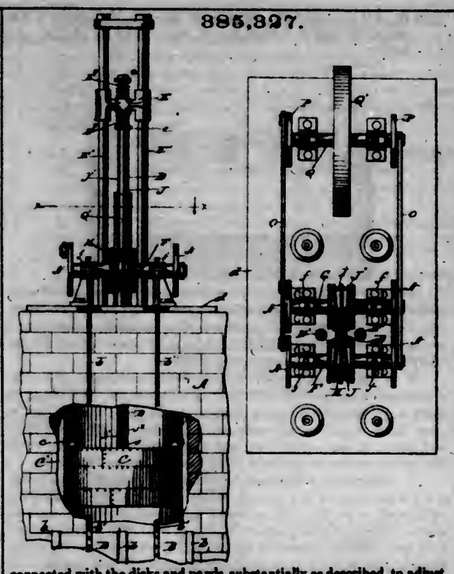
385,326.

Claim.—1. The combination, with the charging box or chamber A, of the rotating plate or false bottom B, having a discharge-opening, and a plunger, P, arranged and operating to forcibly eject powder from said opening, substantially as shown and described.

2. The combination, with the charging-box A and a rotating plate or false bottom, B, having a discharge-opening, of a segmental plate, M, above said false bottom or rotating plate, substantially as shown and described.

3. The combination, with the charging-box A and false bottom or rotating plate B, of the adjustable segmental plates G G', for adjusting the discharge-opening in said false bottom or rotating plate B, substantially as shown and described.

4. The combination, with the charging-box A and rotating plate or false bottom B, having a discharge-opening, of the vertically-adjustable sweep-plate M, substantially as shown and described.



5. The combination, with the charging-box A, of rotating plate or false bottom B, pivoted segmental plates G G', springs H H, and adjustable sleeve K, having a wedge or tapered projection, substantially as shown and described.

6. The combination, with charging-box A, of rotating plate or false bottom B, having a discharging-opening, sweep-plate M, feed-plunger P, having bar *p*, and spiral spring S, with the die cross-head d^2 and rod *t*, whereby when the die descends the plunger will be moved downwardly, and when said die is raised the plunger will be elevated, substantially as shown and described.

7. The combination, with the charging-box A and rotating plate or false bottom B, having a discharging-opening, and plunger P, of spindle C and sleeve U, secured to cross-head d^2, said spindle having a spiral incline leading into a straight groove, whereby said plate will be rotated by the spindle and will dwell when the plunger is in the opening of the discharging-plate, substantially as shown and described.

8. The combination, with the rotating plate or false bottom B, having a discharge-opening, F, of the plates G G' and the detachable interchangeable blocks I I', substantially as shown and described.

385,327. WAVE-POWER MOTOR. FELIX STARKENBURG, Milwaukee, Wis., assignor of one-half to Henry J. Dohmey, same place. Filed Jan. 10, 1888. Serial No. 260,283. (No model.)

Claim.—1. In a hydraulic motor, the combination of a reciprocating float, a cross-head guided in suitable ways, a pitman connected to the float and cross-head, the driven shafts each carrying a winding-drum, and cables passed over the drums and connected with the float and cross-head, substantially as described.

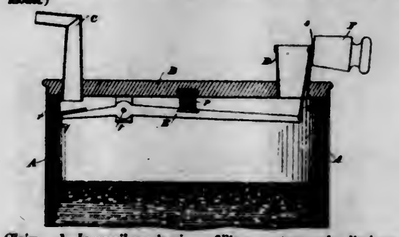
2. In a hydraulic motor, the combination of a reciprocating float operating in a suitable reservoir and guided therein, a cross-head guided in suitable ways, a pitman intermediate to the float and cross-head, two driven shafts, each carrying a winding-drum, and cables wound around the drums in reverse directions and connected with the float and cross-head, substantially as described.

3. The combination of a shaft carrying a ratchet, which is fixed thereto, pawl-carrying disks loosely mounted within the drum and having one or more pawls, and a winding-drum mounted on the shaft and connected with the disks and pawls, substantially as described, to adjust and hold the pawls in their proper positions according to the direction in which the drum is rotated, substantially as described.

4. The combination of a shaft carrying a ratchet, a winding-drum mounted on the shaft to turn freely thereon, and a series of pawls carried by an independent support within the drum and connected with the latter, as described, the pawls being constructed to engage the ratchet when the drum is rotating in one direction and to be lifted clear of the ratchet when the drum is turning in the reverse direction, substantially as described.

5. The combination of a shaft carrying a ratchet, a drum loosely mounted on the shaft to turn freely thereon, loose disks mounted on the shaft within the drum, and a series of pawls pivoted on the loose disks and connected with the drum to be controlled thereby, substantially as described.

6. The combination of a shaft carrying a ratchet, the disks loosely mounted on the shaft and having the slots or notches, the pivoted pawls carried by said disks, and a winding-drum having the transverse shafts or bolts which fit in the notches of the disks and engage the pawls to lift the latter from the ratchet when the drum is rotated reversely, substantially as described.



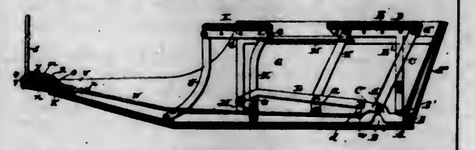
7. The combination of a shaft carrying a ratchet, the notched or slotted disks mounted thereon, the pivoted pawls carried by the disks and having the extended arms, and a winding-drum inclosing the disks and ratchet and having the transverse shafts or bolts which fit in the notches of the disks and between the lifting-arms of the pawls, substantially as described.

8. In a hydraulic motor, the combination of a reciprocating float, two driven shafts, a winding-drum loosely mounted on each shaft and having ratchet mechanism housed therein for alternately coupling and uncoupling the drum to the shaft, a reciprocating cross-head arranged above the driven shafts and connected with the float by an intermediate rod, cables secured at their ends to the float and cross-head and wound in reverse directions around the drums at an intermediate point of their length, and a power-shaft common to both driven shafts and connected therewith by an intermediate pitman, substantially as described, for the purpose set forth.

9. In a hydraulic motor, the combination of a reciprocating float operating in a reservoir and guided therein, upright ways or guides, a cross-head sliding on said ways or guides, a pitman fixed on the float and passing through the cross-head, cushion-springs interposed between said cross-head and the pitman, the driven shafts each carrying a winding-drum, and the cables passed over the drums and connected at one end to the cross-head and having a spring-connection at their opposite ends with the float, substantially as described.

10. In a hydraulic motor, the combination of a reciprocating float, the two driven shafts having crank-disks at their ends, a winding-drum mounted on each shaft, cables connected with the float and passing over the winding-drums, a power-shaft common to both driven shafts, and pitmen connecting the power and driven shafts, substantially as described.

385,328. OIL-CAN. CHARLES H. STRATTON and GEORGE L. ROBERTSON, Chicago, Ill. Filed Mar. 9, 1888. Serial No. 266,754. (No model.)



Claim.—1. In an oil-can having a filling-aperture and a discharge-spout, a stopper to the filling-aperture and a valve to the discharge-spout, in combination with a pivoted lever connecting them, and a spring for normally maintaining the valve upon its seat to close the discharge-spout, as and for the purpose specified.

2. In combination, in an oil-can, a filling-aperture, D, and a discharge-spout, C, a pivoted lever, E, a valve, *q*, carried upon one of its arms, a spring, *p*, for normally maintaining the valve upon its seat to close the discharge-spout, a stopper, F, to close the filling-aperture, and means for connecting it with the other arm of the lever, by which the said lever may be operated, as and for the purpose specified.

3. In an oil-can, a filling-aperture, D, its wall provided with a notch, *s*, a discharge-spout, C, a pivoted lever, E, a valve, *q*, carried upon one of its arms, a spring, *p*, for normally maintaining the valve upon its seat to close the discharge-spout, a stopper, F, to close the filling-aperture, and a link, *o*, adapted to lie within the notch *s* in the wall of the filling-aperture, and thus to engage the stopper in a raised position, as described, when desired, whereby the lever E may be sustained in such position that the valve *q* is off of its seat and the discharge-spout open, substantially as specified.

4. In an oil-can, a filling-aperture, D, and a discharge-spout, C, in combination with a lever, E, and a stopper, F, and a valve, *q*, attached to opposite arms of said lever in such manner that the stopper may operate the said lever, and thereby the said valve, to remove it from its seat upon the discharge-spout, as and for the purpose specified.

385,329. JUMP-SEAT VEHICLE. CHARLES H. STRATTON, Salem, Ohio. Filed Feb. 13, 1888. Serial No. 264,461. (No model.)

Claim.—1. The combination, with a vehicle-body and seats pivotally supported therein, of tie-bars secured to the sides of the body and embracing legs of the seat for limiting the movement of said legs.

2. The combination, with a vehicle-body, seats, and supporting-legs pivoted in the body and to the seats, of tie-bars secured to the inner sides of the body and adapted to loosely receive legs of one seat, and thereby regulate their position, substantially as set forth.

3. The combination, with the rear seat, its supporting-limbs, and two rocker-plates, of a pair of tie-bars attached to the sides of the vehicle-body to prevent their outward strain, by tying them together with the seat and its limbs, substantially as set forth.

4. The combination, with a rear seat, its limbs and supporting-standards, of a front seat, legs supporting the same, the rear legs having shoulders formed thereon, and two parallel bars loosely connecting the legs of the two seats and adapted to bear against the shoulder on the legs of the front seat when the seats are elevated, substantially as set forth.

5. The combination, with the body, rear seat, and a pair of connected jump-seats, of supporting-standards secured to the side plates of the rear seat, and tie-bars secured to the inner sides of the body to assist in supporting the seat, substantially as set forth.

6. The combination, with the sides of a vehicle-body and seat-supporting strips affixed to the inner surface of these sides, of a seat adapted to move front and rearward on pivoted limbs, and tie-bars to tie the sides of the body together by sliding connection with them of the front limbs of the rear seat, substantially as set forth.

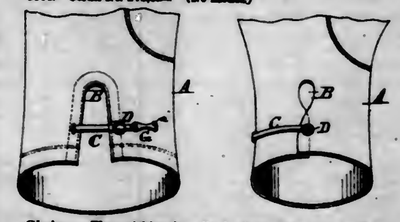
7. The combination, with the sides of a vehicle-body, tie-bars, and strips that support a rear seat and are affixed to the inner surfaces of these sides, of a rear seat, its pivoted limbs, two seat end plates, and two rocker-plates, substantially as set forth.

8. The combination, with a dash, a foot-board, and a cross-sill on which the foot-board rests, of bifurcated guide-bars, the upper limbs being attached to the foot-board rigidly, and the lower limbs adapted to slide in holes in the cross-sill, and means to move the guide-rods endwise, substantially as set forth.

9. The combination, with a foot-board, a dash fixed to it, and a cross-sill of the vehicle-frame, of parallel guide-bars fastened to the foot-board and adapted to slide in holes in the cross-sill, and connecting-bars pivoted to the inner ends of the guide-bars and also to the limbs of the rear jump-seat, substantially as set forth.

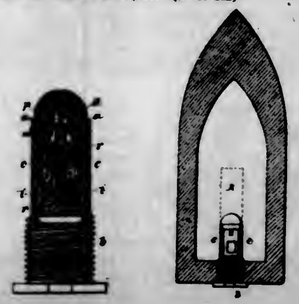
10. The combination, with the body of a vehicle, a cross-sill fixed thereto, and parallel guiding-bars adapted to slide backward or forward in the sill, of a foot-board held fast to the guiding-bars, and a dash secured to said foot-board, substantially as set forth.

11. The combination, with the body of a vehicle, sliding seats therein, and connecting-bars having pivotal connection with legs of the seats, of a fixed cross-sill in the forward end of the body, parallel guiding-bars adapted to slide therein, the latter being pivoted to the connecting-bars, a foot-board held fast to the guiding-bars, and a dash secured to the foot-board, substantially as set forth.



12. The combination, with a pair of pivoted jump-seats, the rear legs of one seat having a downwardly-projecting web thereon, of a sliding dash, and a connecting-rod pivoted to the dash and to the web, whereby the former is operated by a movement of the seat, substantially as set forth.

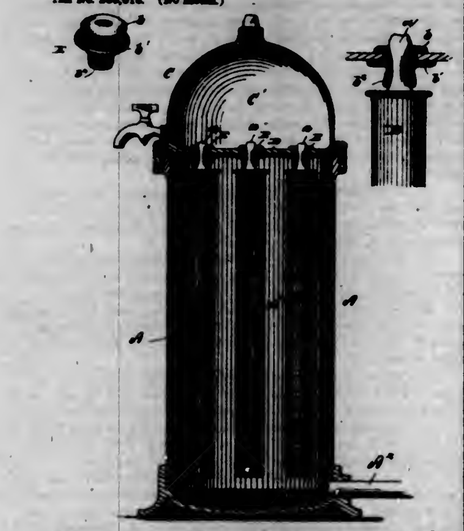
385,330. STOCKING-SUSPENDER CLIP. FREDERIC R. TAYLOR, Birmingham, County of Warwick, England. Filed Mar. 31, 1887. Renewed Jan. 12, 1888. Serial No. 260,562. (No model.) Patented in England July 21, 1886, No. 8,737.



Claim.—In a suspending-clasp, the upper metallic plate, H, shaped, as shown, with prongs H^2 and slot J and fastened to the bottom plate, B, which is made of metal and provided at one end with slots D D and at the other end with oblong slots E E, and acted upon by the lever-arm O, shaped like the letter S, and hinged to plate B at N, substantially as and for the purpose set forth.

385,331. GLOVE-FASTENER. WILLIAM D. THOMPSON, Bath, assignor of one-half to John J. Dunshee, Keene, N. H. Filed Apr. 17, 1888. Serial No. 270,982. (No model.)

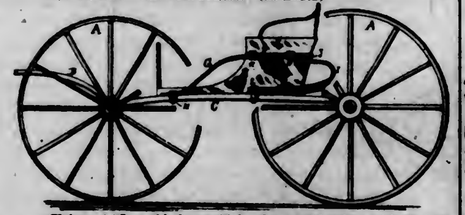
Claim.—The within-described glove-fastener, consisting of a thong, C, secured to one of the flaps of the slit B, the re-enforcing eyelet D, through which the said thong passes freely, the clasp G, attached to the free end of said thong and provided with a hook, *e*, and the perforated plate E, secured to the glove, all substantially as described.



385,332. SHELL. MAX VON FÜRSTEN, Berne, Germany. Filed Mar. 8, 1888. Serial No. 266,622. (No model.)

Claim.—1. In a shell, the combination, with the body of the shell and its bursting-charge, of the tube *c*, a percussion-fuse with initial cartridge *i*, inserted into the tube *c*, and means for fastening the fuse in the tube and adapted to give way when the fuse flies forward in consequence of the impact of the shell against its mark, the bursting-charge being provided on the prolongation of the tube *c* with a channel, *k*, substantially as and for the purpose specified.

2. In a shell, the combination, with the body of the shell and its bursting-charge, of the tube *c*, a percussion-fuse with initial cartridge *i*, inserted into the tube *c*, and the wire *d*, detachably connected to the tube *c* and extending over the fuse-head for retaining it normally in said tube, the bursting-charge being provided on the prolongation of the tube *c* with a channel, *k*, substantially as and for the purpose specified.



385,333. FILTER. FRANK E. WAY, Springfield, Ohio, assignor of one-half to Henry C. Dimond, same place. Filed Mar. 30, 1886. Serial No. 268,016. (No model.)

Claim.—1. A tube-coupling, substantially as set forth, formed of flexible material, and provided with the upper and lower flanges of a larger diameter than the opening into which said coupler is adapted to be inserted, and the projecting nipple, substantially as and for the purpose set forth.

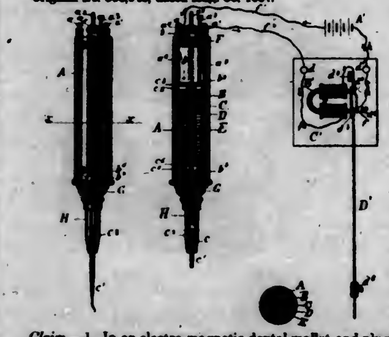
2. In a filter having a main chamber and a filtering-chamber separated by a partition, of one or more filtering-tubes passing through the said partition, said tubes or pipes being each provided with a coupler having the projecting flanges of larger diameter than the opening in said partition on opposite sides of said partition, and the extending nipple, substantially as and for the purpose set forth.

385,334. VEHICLE-SPRING. FREDERIC H. WETMORE, Cortland, N. Y., assignor of one-half to Ejalmar Malmberg, same place. Filed Sept. 12, 1887. Serial No. 249,698. (No model.)

Claim.—1. In a side-bar vehicle, the combination, with the side bars and body, of the springs composed of two parts, G I, the forward end of G being secured to the forward end of the side bar and its rear end shackled to the forward end of the spring I, the lower end of spring I being secured to the side bar at a suitable distance to the rear of the secured end of part G, the body being suspended between the springs and secured thereto, substantially as specified.

2. The combination, in a side-bar vehicle, of the body and side bars thereof, the springs composed of two parts, G I, the part I secured to the side bar at a suitable distance from the rear end of said bar, said part extending rearward, curving upward and over upon itself, and shackled to the part G, which is secured to the side of the body and curves downward, having its forward end secured to the side bar, substantially as set forth.

385,335. STOVE-POLISH. CHARLES REMBRANDT, Philadelphia, Pa. Filed Nov. 24, 1886. Serial No. 219,764. (Specimens.)



Claim.—1. As a new and improved article of manufacture, a stove-polish in a granulated form, substantially as described.

2. As a new and improved article of manufacture, a stove-polish consisting of a mixture of plumbago and an adhesive substance, granulated and polished, substantially as described.

3. The method herein described of making stove-polish, consisting in first mixing plumbago with soap-stock; second, breaking and grinding the same while drying, and, third, in polishing the granulated article, all substantially as described.

REISSUES.

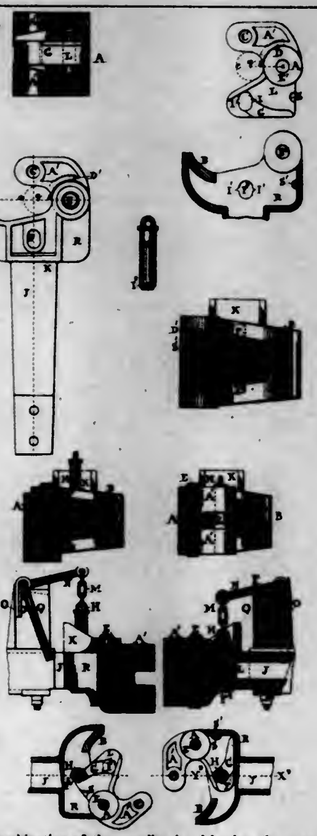
10,940. ELECTRO-MAGNETIC DENTAL HAMMER AND PLUGGER. PHILIP HEMME, Clinton, Iowa. Filed May 7, 1888. Serial No. 273,120. Original No. 366,946, dated Aug. 30, 1887.

Claim.—1. In an electro-magnetic dental mallet and plugger, the combination of the inner and outer electric coils, B C, the core E, having the disk-head b^2, the mallet-rod b^3, the adjusting-screws a^6 a^7, the tension-spring b', the tubular magnet D, the posts a^8 a^9, supporting the head F, the binding-posts *a a'*, the stem H, the slotted holder *c*, and the plugger *c'*, substantially as and for the purpose described.

2. In an electro-magnetic dental mallet and plugger, the inner and outer electric coils, B C, the core E, having the disk-head b^2, the mallet-rod b^3, the adjusting devices a^5 a^6, the tension-spring b', the tubular magnet D, the supporting devices a^6 a^7, the binding-posts *a a'*, the stem H, the slotted holder *c*, and the plugger *c'*, in combination with the magnets B', the contact-spring d^3, the armature d^2, attached to the spring, the adjustable contact-point *f*, and the pendulum D', attached to the armature and provided with the adjustable weight d^5, substantially as and for the purpose described.

3. In an electro-magnetic dental mallet and plugger, the combination of the inner and outer electric coils, B C, the movable core E, having the disk-head b^2, the mallet-rod b^3, and the fixed tubular magnet D.

10,941. CAR-COUPLING. MADISON J. LORRAINE and CHARLES T. AUBIN, St. Louis, Mo. Filed Dec. 15, 1887. Serial No. 258,041. Original No. 366,195, dated Aug. 30, 1887.



Claim.—1. The combination of the ⊃-shaped coupling-head pivoted at its center, the draw-head, and the automatic locking-pin, for the purposes set forth.

2. The combination of the ⊃-shaped coupling-head, the draw-head; the pivot E, the inclined (or curved) groove D, and the knob or pin D', for the purpose of making an automatically-opening coupling-head.

3. The combination of the ⊃-shaped coupling-head, the groove G, the draw-head, the locking-pin resting on top of the arm L when the coupling-head is open and falling through the holes F and F^2 when the coupling-head is closed, and the lever-arm and chain, substantially as described.

4. The combination of the ⊃-shaped coupling-head pivoted at its center, the draw-head, the locking-pin, the car-body, the lever-arm and chain, and the block P, attached to the timber Q, for the purpose of setting not to couple.

10,941.

5. The combination of the coupling-head having the grooves D and G and the holes F' and F', the pivot E, the draw-head having the holes F^2 F F^3 and the knob D', the buffer B, and the pin H, having the projecting knob I^2, substantially as described.

6. The combination of the ⊃-shaped coupling-head having the recess S, the locking-pin engaged with the rearward arm of said coupling-head, and the draw-head having the rib S', which fits in the recess S only when the coupling-head is closed for making the coupling-head firm and secure when locked.

7. The combination of a coupling-head turning laterally on its pivot, and having an external arm extended to engage with and grip a like fellow and a rearward arm intended to engage with some locking mechanism, with a draw-head carrying a common gravity vertically-moving locking-pin, said automatically-locking pin riding directly upon such rearward arm when opened and locking such inner arm by dropping through a hole perforated in the inner arm of the coupling-head, substantially as described.

8. The combination of two similarly-constructed draw-heads having ⊃-shaped pivoted automatically-opening coupling-heads and the automatic locking-pins, substantially as described, for the purpose of making an automatic coupling.

9. The combination of a coupling-head, the draw-head, the pivot E, the inclined (or curved) groove D, and the knob or pin D', for the purpose of making an automatically-opening coupling-head.

10. The combination of a coupling-head, the draw-head, the groove G, the locking-pin resting on top of the arm L when the coupling-head is open and falling through the holes F' and F^3 when the coupling-head is closed, and the lever-arm and chain, substantially as described.

11. The combination of the draw-head, the pivoted coupling-head, and the locking-pin, said locking-pin resting upon the inner arm of the coupling-head when the coupling-head is opened and riding upon said inner arm when the coupling-head is turned to be closed, and said inner arm being grooved to receive and guide the locking-pin.

12. The combination of the draw-head, the pivoted coupling-head, and the locking-pin, said locking-pin working vertically in a perforation in the draw-head and resting directly upon the inner arm of the coupling-head when the coupling-head is opened, riding directly upon said inner arm when the coupling-head is turned to be closed, and dropping through said inner arm to secure said coupling-head when closed.

13. The combination of the coupling-head having the groove D and the holes F' and F', the pivot E, the draw-head having the holes F^2 F F^3 and the knob D', the buffer B, and the pin H, having the projecting knob I^2, substantially as described.

14. The combination of the pivoted coupling-head having the inclined or curved groove, with the draw-head provided with a knob or pin to travel in said inclined groove, for the purpose described.

15. The combination of the pivoted coupling-head having the grooves D and G and the holes F' and F', the draw-head having the holes F^2 F F^3 and the knob D', the buffer B, and the pin H, substantially as described.

16. The combination of the pivoted coupling-head having the grooves D and G and the holes F' and F', the draw-head having the holes F^2 F F^3 and the knob D', and the pin H, substantially as described.

17. The combination of the coupling-head having the holes F' and F', the pivot E, the draw-head having the holes F^2 F F^3, and the pin H, having the projecting knob I^2, substantially as described.

18. The combination of the draw-head, the pivoted coupling-head, and the vertically-moving locking-pin, the inner arm of said coupling-head, when the coupling-head is closed, being held by said pin and also interlocked with the draw-head at a point between the location of said locking-pin and the coupling-head pivot, for the purpose described.

19. The combination of a coupling-head turning laterally upon its pivot and having an external arm intended to engage with and grip a like fellow, and an inner arm intended to engage with some locking mechanism, with a draw-head carrying a common gravity vertically-moving locking-pin riding directly and solely upon such inner arm when the coupling-head is open and dropping to lock it when closed, substantially as described.

20. The combination of two similarly-constructed draw-heads having pivoted automatically-opening coupling-heads and the automatic gravity-locking pins, substantially as described.

PHOTO LITH. NORRIS PETERS

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE DE BAUSSET.

Decided June 16, 1883.

1. The Office is bound to raise the question of utility of an alleged invention in cases where natural laws and established principles are disregarded, for the reason that the law does not authorize the grant of Letters Patent except for novel and useful inventions. In such cases, even if novelty were admitted, a patent would be withheld until applicant should demonstrate the operativeness of his device. *Ex parte* statements or theoretical arguments are not sufficient; applicant must prove by practical demonstration his assertions.
2. The patent system was not designed to protect the chimerical schemes of visionaries or closet theorists. Invention consists in more than the work of the imagination. To conceive of a scheme of vast dimensions is the work of a dreamer; to make the mathematical computations requires the ordinary knowledge of the student; to face the difficulties of construction and devise means to overcome them is the true work of the inventor.

APPEAL from Examiners-in-Chief.

AIR-SHIPS.

Application of Arthur de Bausset filed March 11, 1886, No. 194,910.

Messrs. Dyrenforth & Dyrenforth for the applicant.

HALL, *Commissioner:*

This application was formally rejected by the Primary Examiner for want of operativeness, that being the only question involved in such action of the Office. Upon appeal, the decision of the examiner was affirmed by the Examiners-in-Chief. Thereupon applicant appealed to the Commissioner. The case was referred to and heard by the Assistant Commissioner, who reversed the action of the Examiners-in-Chief upon the record as it then stood. The attention of the Commissioner having been called to the matter, and it having been suggested that other questions of merit were present in the case which had not been involved in the previous action of the examiner, the application was remanded to the Primary Examiner, with direction "to examine the application on its merits, and allow or reject the case as his judgment may determine." The examiner, regarding this direction as an authority to treat the case *de novo*, went more at length into the question of operativeness, and also based the rejection, which he again made, upon certain references which had been before cited. The case was again appealed to the Examiners-in-Chief, who affirmed the decision of the Primary Examiner, and it is now before the Commissioner on appeal from the decision of the Examiners-in-Chief.

The references are the following patents: Abruzzo, July 21, 1868, No. 80,107; Emsley, April 17, 1883, No. 276,012; Hamon, October 5, 1886, No. 350,303.

In support of the reasons given by the examiner for holding the device inoperative the following publications are referred to: *Strength of Materials*, Thos. Box, London, E. & F. N. Spon, 1883, pp. 448 and 449; *Steam Boilers, their Construction and Management*, W. H. Shock, New York, Van Nostrand, 1880, sec. 13, p. 351; *Appleton's Dictionary of Mechanics*, New York, D. Appleton & Co., article, "Boring Mills;" *Natural Philosophy*, D. Olmsted, New York, Collins & Bro., 1849, pp. 128, 128, and sec. 198; *Encyclopedia Britannica*, Boston, Little, Brown & Co., 1875, article "Aeronautics;" *Mechanic's Almanack*, 1880–1885, Calvert, London, J. Heywood, 1886, p. 39, Fig. 9, p. 41; *History and Practice of Aeronautics*, J. Wise, Philadelphia, Joseph A. Speel, 1850.

The claims are as follows:

1. An air-ship comprising, in combination, a hollow metallic body and a pneumatic pump or pneumatic pumps for producing a vacuum therein, whereby the ship may be caused to rise, substantially as described.
2. An air-ship comprising, in combination, a hollow metallic body, a pneumatic pump or pneumatic pumps for producing a vacuum therein, and a car attached to the hollow metallic body, substantially as described.
3. In an air-ship, a metallic cylinder constructed substantially as described, provided with a pneumatic pump or pneumatic pumps and pointed or cone-shaped ends, substantially as described.
4. In an air-ship, a metallic cylinder provided with a pneumatic pump or pneumatic pumps, pointed or cone-shaped ends, and electrical apparatus for operating the same, substantially as described.
5. In an air-ship, a metallic cylinder provided with a pneumatic pump or pneumatic pumps, pointed or cone-shaped ends, and a spring-support for the points, substantially as described.

The first claim defines nothing but an air-pump, viz: a hollow metallic body and a pneumatic pump or pumps for producing a vacuum therein. The fact that it is called an "air-ship" and that by creating a vacuum in the metallic body the ship may be caused to rise are mere statements of results and not of construction. The same statement may be made of the third claim, except that the air-pump is constructed with cone-shaped ends; but it would be none the less an ordinary air-pump.

Applicant's conception is that a vessel constructed of metal of sufficient dimensions and with the atmos-

phere exhausted may possess a sufficient degree of levitation by means of displacement to float in the atmosphere. The construction and relation are precisely identical with those of the submarine diving-boats, from which the water is either pumped or originally excluded, and the levitation controlled by the admission of more or less water or its expulsion, the only difference between the two being that in the one case the atmosphere is pumped out or allowed in as the aeronaut desires to rise or descend, while in the other the water is pumped out or allowed ingress as the navigator desires to rise or descend in the water.

The patent to Abruzzo clearly shows an air-ship consisting of a hollow metallic body and pumps by which the metallic body may be exhausted, and having a car attached to the said body—in other words, all the elements called for in the first two claims of applicant. In Abruzzo's cylinder there appears only one end cone-shaped, while in applicant's third claim both ends are cone-shaped; but it is obvious, as suggested by the examiner, that there is no invention in making the second end of the vessel of the same shape as the first.

Claim 4, covering a combination the same as the previous claims, with the addition of an operating apparatus, is also anticipated by Abruzzo, and the fact that applicant operates his apparatus with electrical force or machinery gives it no patentability over and above what is disclosed by Abruzzo.

In claim 5 is found the device of a spring-buffer at the extreme point of the cone-shaped end. Spring-buffers are shown in the reference, differently located, it is true; but undoubtedly a mere change in the position of the buffer to a location where it is thought to be more desirable or useful involves no invention.

Applicant proposes to build an air-ship in cylindrical form which he prefers to make about four hundred and fourteen feet long and about one hundred and forty-four feet in diameter, with a cone and prow 120 feet long at each end. The length over all is therefore 654 feet. This vessel is constructed of steel plates one forty-fourth of an inch thick riveted together and to steel ribs inside. These ribs are placed about nine feet apart, and are one and one-fourth inch wide by one-eighth of an inch in thickness. This vessel is not to be inflated like an ordinary balloon, but is to be exhausted of air until it becomes buoyant enough to support the vessel itself and its attachments, consisting of a car for its load, propelling and steering machinery, and pumps for exhausting the vessel as necessity may require. In addition to these light ribs there are interior supports and compartments, and the ribs are particularly set forth as intended to prevent collapse. Applicant has gone into elaborate computations as to the weight of such a cylinder and its appurtenances to show its buoyancy and sustaining power under ordinary atmospheric conditions.

The examiner has denied both the novelty and utility of the alleged invention, and has been fully sustained by the Examiners-in-Chief. There is nothing in any of the claims that is not fully met in the references cited, in which are found the vessel of the same shape as applicant's, pumps for exhausting the air therein, and propellers worked by an electric motor. The idea of using a metallic vessel exhausted so as to be buoyant in the atmosphere is shown to be over two centuries old, so that it appears that there is not a single novel idea embraced in the claims presented.

But apart from these references the examiner has given unusual attention to the reasoning by which applicant attempts to support his hypothesis. His answer to the reasons of appeal demonstrates the fallacies of applicant's argument, and, in our present knowledge of natural laws, is to my mind unanswerable. He observes that in structures showing some analogies to that proposed, an enormous internal bracing has been found necessary in order to enable them to resist a much slighter comparative outside pressure than that upon applicant's cylinder. Such structures are the outcome of the highest engineering skill of the day. They have been planned with careful regard to the tested strength of materials and proportion of parts, and are employed under conditions of stability as remote as can be conceived from those of applicant's cylinder. The force of such illustrations is not to be overcome by closet theorists nor by mathematical computations, however minute, that ignore established natural laws. The record shows no attempt to overcome such objections. The legitimate and unavoidable conclusion reached by the examiner is that to enable the structure to sustain its weight, even prior to the exhaustion of air, it must be supported by enormous bracing, such as is seen in the iron roof of a railway depot or the hull of an ocean steamer. Such bracing by its weight must overcome all the buoyancy the cylinder can derive from the exhaustion of air from its interior, and without such bracing its collapse (even supposing it is built) is as inevitable as the laws of nature. It cannot be built; but supposing the difficulties of building it were overcome, it would be incapable of use. Under the circumstances, even if novelty were admitted, it must be held that a patent must be refused at least until applicant practically demonstrates the operativeness of his device. The patent system was never designed to protect the chimerical schemes of visionaries. Invention consists in more than the work of the imagination. Applicant has only carried his conception up to the point where invention must begin. To conceive of a scheme of vast dimensions is the work of a dreamer; to make the mathematical computations requires only the ordinary knowledge of the student; to face the difficulties of construction and devise means to overcome them is the true work of the inventor, and it is in these means that the invention must consist, where others in the same field have failed.

It is not true that one who simply conceives an invention may obtain a patent if he has never completed such invention or demonstrated beyond a doubt that it is capable of successful operation. (*Gardner* v. *Dudley*, C. D., 1880, 123.)

An imperfect and incomplete invention resting in mere theory or in intellectual motion, or in uncertain experiments, and not actually reduced to practice and embodied in some distinct machinery, apparatus, manufacture, or composition of matter, is not patentable. (*Draper* v. *Potomska Mills Corp.*, 13 O. G., 276.)

Patents are granted only for inventions which possess novelty and utility. The last consideration is rarely raised, since it is generally held that unless a device is actually harmful in some way its utility need not be questioned. But this does not cover the whole ground.

Whether an invention is useful in the sense of the patent laws is not whether it is mischievous or hurtful or frivolous or insignificant, but whether it is capable of use for a purpose from which some advantage may be derived. (*Crouch* v. *Speer*, 6 O. G., 187.)

To constitute utility, it must be a practical method of doing the thing designed. (*Roberts* v. *Ward*, 4 McL., 568.)

The Office is bound to raise the question of utility in cases in which known laws and established principles are disregarded.

When, as in this case, the universal law of gravitation must be ignored in one portion and doubled in another in order to make the device operative, the question as to whether it is "sufficiently useful and important" is pertinent. (*Ex parte Smith*, C. D., 1878, 139.)

When the question of operativeness is raised in cases of this character it is not to be resolved by *ex parte* statements or by theoretical argument. The applicant must overbalance the opposing reasons in the judgment of the tribunals having jurisdiction of the case.

These reasons may be suggested by the laws of nature or by the testimony of witnesses. In case of evident conflict between the two the former must of course prevail. (*Ex parte Winterlich*, C. D., 1879, 240.)

The Office is particularly bound to take notice of the question of utility, because the law does not authorize the grant of patents except for useful inventions, and the fact of a grant is an assurance to the public of the conclusions of the Office in this respect as well as in respect to novelty.

The patent is *prima facie* evidence of utility. (*Vance* v. *Campbell*, 1 Fisher, 483; *Wayne* v. *Holmes*, 1 Bond, 27; *Lee* v. *Blandy*, 1 Bond, 351; *Tilghman* v. *Werk*, 1 Bond, 511.)

The Office cannot be too careful on this point. Cases are not unknown where patents have been secured by a technical compliance with Office requirements, and then used simply to impose on a public not disposed to scrutinize closely the merits of a matter upon which the Patent Office has set the seal of its approval.

The present case deals with ideas long exploded and proposes not a single step in advance of what has long been known. It differs from former schemes only in its gigantic proportions. This cylinder is to be as long as the Capitol, and its diameter equals the width of one of our great avenues. These dimensions may seem to the visionary to demonstrate the greatness of applicant's conception; but it is great in no other respect. Applicant has not only struck out no new track, but confesses that there has been no attempt even at reduction to practice.

I am aware that it is settled by the authorities in the Office that when there is a reasonable doubt as to the utility of an invention it is to be resolved in favor of the applicant. That rule may be applicable either when applicant has made no attempt to reduce to practice, but relies upon a statement and description of his invention, or when he claims that he has substantially reduced it to practice; but in either event it must be a matter of reasonable doubt.

In this case I am not satisfied that there is even a doubt. Indeed, the opinion of all the experts in the Office who by education and experience are qualified and competent to give this subject careful and scientific investigation is unanimous that it is wholly impracticable and impossible to construct such an air-ship.

The decision of the Examiners-in-Chief is therefore affirmed.

EX PARTE WEEKS.

Decided June 15, 1888.

COMBINATION AS DISTINGUISHED FROM ADAPTATION.

Claims for combinations distinguished from claims covering elements having a specific construction and arranged in such peculiar relation as to be adapted to use with each other. While it cannot be doubted that it is the better practice in all cases of novel combination to express the claim in combination form, it sometimes occurs that an invention is of such peculiar character as to render such a claim unimportant.

ON petition.

ACCELERATING GUNS AND CARTRIDGES.

Application of Asa Weeks filed March 29, 1883, No. 89,826.

Mr. Wallace A. Bartlett for the applicant.

HALL, *Commissioner:*

This case comes before the Commissioner on appeal from the action of the examiner requiring division. The application contains nine claims, three of which cover the piece of ordnance having a peculiar construction, in that it possesses one or more small grooves or short rifles in that portion of the bore where the charge is located. The remaining six claims cover a cartridge which is constructed in sections so arranged that when the rear section is exploded the remaining sections are consecutively exploded by means of the flash-flame of the explosion reaching them through the grooves or rifles as the charge advances toward the muzzle of the gun.

A minute or specific description of the invention is not required. It is clear that the flash groove or rifle of the gun has no purpose or function other than to assist in the successive explosion of the sections of the cartridge, and the cartridge as constructed could not be exploded in the manner described in a gun so constructed except by means of the flash-grooves.

The examiner required division between the three claims covering the gun and the six claims covering the cartridge. The Committee on Division were divided in opinion, two of them approving the action of the examiner and the third member dissenting from such approval.

The relation between a cartridge and the gun or engine in which it is discharged is a somewhat peculiar one, and this peculiar relation probably called the attention of the Committee on Division to the ninth claim, with a view of determining whether it was a claim for a combination between the gun and the cartridge. The dissenting member of the Committee was inclined to hold that it was a combination claim; but I am not able to concur in that view and do not think it is capable of such an interpretation. If the case were one in which a combination claim could be maintained, and there existed a real combination, I think the presence of such a claim would be immaterial. It cannot be doubted that it is the better practice in all cases of novel combination to claim such combination, as well as the novel elements which enter into the combination; but this is not absolutely essential or necessary. It sometimes occurs that an invention is of such peculiar character that while a combination claim would be entirely proper

it would be quite unimportant and need not be inserted. In such case, when an applicant shows, but does not claim, a novel combination, I see no reason why he might not present claims for all the novel elements which have not acquired a status in the arts and in invention and are incapable of use in other relations—that is to say, he may claim precisely the same elements without a combination claim which he could with such claim, provided he would be allowed to make the latter claim and it is new.

In the present case, while both elements—the gun and the cartridge—are old, it is asserted that each has a specific construction which constitutes a combination, and that in view of this relation applicant is entitled to present claims for the combination and for all of the elements which are new; that the gun with these peculiar grooves or rifles is new, and that the cartridge arranged in sections and to be discharged by means of the flash-flame operating through the grooves of the gun is also new, and that therefore applicant is entitled to present claims for the two elements, although he has not presented a combination claim.

In the first place, I am not prepared to concede that the relation between the piece of ordnance or gun and the powder or cartridge is such as to constitute a combination. The use of the powder in the shape of cartridges is old, and the use of the gun with or without grooves or rifles is old. There is a certain degree of adaptation between the two which is different from the relation of combination. Originally the javelin or the stone was thrown by the human hand. In the evolution of invention bows and other devices took the place of the hand in hurling the javelin or the stone. From the stone or the javelin, or both, has proceeded the modern projectile, while explosives have taken the place of physical and other forces, and the gun is the fulcrum or engine enabling the explosive power of the powder to react upon the projectile and give it velocity and direction, so that the gun-barrel, which is only the successor of the original tube through which the Indian blew his dart or arrow, has been constructed with regard to adaptation to the projectile and the projectile has been constructed with reference to the gun, and the powder, which is nothing but a composition of matter, bears the same relation to the two which steam, or water, or gas, or other inflammable material does to the apparatus through which they communicate power to certain parts or portions of machinery.

As an illustration of the distinction between adaptation and combination there is the instance of the modern type-writer and the paper upon which it writes. The paper was old, and has been used for an indefinite period. When inventive genius sought to find better and more rapid methods of writing upon it than by the hand and pen, the type-writer was devised, and the type-writer is absolutely useless and of no value whatever except in connection with the writing material which we call "paper," and yet no one will pretend that there is any combination between the paper and the type-writer, although it is a clear case of special and necessary adaptation. The same thing may be said to be true of the wheel of the locomotive and the rail upon which it runs. There is no combination between the two. They are simply adapted to each other; and if some one were to suggest the introduction of a groove in the rim of the wheel and a corresponding ridge in the rail, so that the groove would run upon the ridge, there would be no more combination between the wheel and the rail after such introduction than before. It would be merely an additional adaptation, and so innumerable illustrations may be cited, and I think the relation of a gun and a cartridge precisely the same. The gun is an independent subject of manufacture and invention, and so far as the cartridge is concerned can be used in an infinite variety of other relations. The gun with this specific flash-groove introduced into it is none the less capable of being used in any other relation as a gun. The cartridge itself can be used in other relations, but could not exercise the functions which belong to it as a cartridge constructed in sections to be exploded consecutively; but whether there are other means by which it might be exploded instead of resorting to the grooves of the gun is not developed in the history of this case, and perhaps is immaterial.

It is probably safe to state that the cartridge is so far new and is of such peculiar construction that it could not be used or applied in other relations, and while, as said above, such fact does not make its relation to this gun a combination, it gives it an independent status as a new article of manufacture. It is undeniable that, having reference to the gun with its peculiar function, growing out of the groove or rifle and its peculiarly-constructed cartridge made to be discharged through the efficiency of the groove in the gun, it may be said that each is incapable of exercising its peculiar function without the assistance of the function of the other. But this, it is evident, depends wholly upon the existence of the groove through which the flash-flame may communicate to the forward section of the cartridge. I regard this slight groove or change in the bore of the gun as being nothing more than an adjunctive device, constituting no other part of the invention than would a tube through which a fuse could be admitted through the wall of the gun to the successive chambers of the cartridge. It is only a vent to the cannon, communicating fire from the rear section of the cartridge to the other sections. It has no more mechanical connection with the cartridge than the old and ordinary vent by which fire is communicated to the rear section of the cartridge. It is simply a part of the cannon, and is adapted to such a cartridge just as the original vent is to the ordinary cartridge. Ordinarily in questions of this character when there is any serious doubt the applicant would be entitled to the benefit of the doubt and would be allowed to unite his claims; but guns and ordnance are so entirely distinct and separate from cartridges, both fixed and others, in manufacture, invention, and all other respects, that I do not feel willing to allow claims for them to be comprehended in the same application, unless the necessity and right are clear and obvious.

I therefore affirm the action of the Primary Examiner in requiring division of this application.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Southern District of New York.

BLAUM *v.* NATIONAL BARROW AND TRUCK COMPANY.

Decided April 24, 1888.

BENJAMIN—WHEELBARROWS.

Letters Patent No. 349,681, granted to William Benjamin, September 28, 1886, for an improvement in metal wheelbarrows, adjudged not infringed by a construction like that described in Patent No. 355,245, granted to Joseph Annin, December 28, 1886, for metal wheelbarrows.

Mr. Worth Osgood for the plaintiff.
Mr. W. B. H. Dowse for the defendant.

SHIPMAN, *J.*:

This is a bill in equity which is founded upon the alleged infringement of Letters Patent No. 349,681, dated September 28, 1886, to William Benjamin, assignor to the plaintiff for an improvement in metal wheelbarrows.

The patented invention was an improvement upon a metallic wheelbarrow the frame of which was composed of two tubular metallic handles or side bars and two cross-bars provided with eyes which fitted upon the handles and were shrunk thereon. This device is shown in Letters Patent No. 246,584, dated August 30, 1881, to William C. Wren, assignor to Joseph Annin. Its method of construction was defective because the barrows could not be "knocked down" or taken apart, and thus economically transported in quantities. The improvement consisted, in brief, in dividing the eyes. The eyes, as shown in the drawings, are composed of curved or semicircular portions upon the ends of the cross-bars and movable U-shaped portions or clips which are pressed toward the cross-bars, and being held in position by one or more bolts clamp the side bars in place. The specification says that—

> The part of the clips or eyes that encircle the side bars or handles must be formed somewhat smaller than the outside diameter of the handles, so that when the bolts are screwed together they will draw the eyes tightly around the handles, thus making a rigid and substantial frame with or without the tray.

The claims of the patent are as follows:

> 1. In a wheelbarrow, the combination, with the metal tray, of the cross-bars C D, for supporting and strengthening the bottom of the same, and the side bars or handles, B, the cross-bars being provided with eyes of adjustable size, and bolts by which said handles may be detachably clamped therein, substantially as set forth.
>
> 2. The herein-described frame for a wheelbarrow, consisting of the front and rear cross-bars, C D, for supporting and strengthening the bottom of the tray, the substantially parallel side bars or handles, B, the cross-bars being provided with eyes of adjustable size for the reception of the handles, and bolts for detachably clamping the handles, substantially as set forth.

The defendant makes wheelbarrows under Letters Patent No. 355,245, dated December 28, 1886, to Joseph Annin. The cross-bars of this barrow are straight flat bars of iron which project beyond the handles. Each extremity is provided with a U-shaped clip for clamping the handles, which clip is provided at one end with a claw which passes around the end of the cross-bar and at the other end with a flange which is perforated for the reception of a bolt which secures the clip.

The question of infringement depends upon the construction of the Benjamin patent, and, in my view of the case, is the only question which demands consideration. I therefore omit discussion in regard to the authorship or the patentability of the invention.

The eyes upon the cross-bars of the William C. Wren patent were integral with the cross-bars, and, having been heated, were slipped over the handles and were shrunk thereon. The form of the improvement which is described in the patent consisted in making one portion of the eye a detachable clip, which was fastened to the cross-bar by a bolt or bolts, these bolts drawing the eye tightly around the handles, and thus enabling the eye to be called adjustable. The Benjamin patent admits the fact that clips and clamping-eyes had been used in various situations, and it is manifest from the history of the art that they had been used to fasten the tubular metallic handles of a wheelbarrow to its tray and to secure the metallic transverse springs of a carriage to its wooden side bars. Inasmuch as in no pre-existing device detachable eyes had been virtually a part of the cross-bars, the effort is made to have the patent broad enough to include all detachable and adjustable eyes, although not integral with the cross-bar, which are secured to and by means of the fastening can be called, in effect, a part of the cross-bars. Any one of these various eyes can be considered adjustable, because the interior diameter of the eye may be varied by screwing or unscrewing the bolts. The claims of the patent are also broad enough to include a split eye which is integral with the cross-bar, the several parts being united by bolts which detachably clamp the handles in the cross-bars. Neither one of these constructions is permissible, because the invention simply consisted in dividing the eye of the Wren patent, in which handles and cross-bars had been united by the eyes of the cross-bars, and making one portion of the eye detachable. Detachable clamping-eyes which screwed the tray to the handles were old. An eye which was part of the cross-bar and clamped the handle was old. Assuming that there was patentable invention in dividing this eye into two parts and making one part detachable, it is improper to extend the patent so as to make it include all detachable clips which encircle the handles and clamp them to the cross-bars. That was not the invention of the patentee, who sought only to improve upon the conception of the pre-existing Wren patent. The invention consisted in the manner in which the eye was constructed, by which method a portion of the eye was integral with the cross-bar, and does not include detachable clips which are secured to a straight cross-bar. There is no infringement.

The bill is dismissed.

NEW PATENT LAW OF INDIA.

(The following copy of the Indian Patent Law, approved March 16, 1888, is furnished for publication by Messrs. W. P. Thompson & Co., of Liverpool, England.)

ACT No. V OF 1888.

The Inventions and Designs Act, 1888.

AN ACT to consolidate and amend the law relating to the Protection of Inventions and Designs.

Whereas it is expedient to consolidate and amend the law relating to the protection of inventions and designs; It is hereby enacted as follows:—

Section 1. (1) This Act may be called the Inventions and Designs Act, 1888.

(2) It shall extend to the whole of British India; and

(3) It shall come into force on the first day of July, 1888.

Sec. 2. (1) The enactments described in the first schedule are hereby repealed to the extent specified in the third column thereof.

(2) But this repeal of enactments shall not affect any exclusive privilege acquired, or any conditions or restrictions imposed with respect to any such privilege, or any right or liability accrued or incurred, under any of those enactments before the commencement of this Act, or any relief in respect of any such privilege, right, or liability.

(3) Any enactment or document referring to any enactment hereby repealed shall be construed to refer to this Act or to the corresponding portion thereof.

Sec. 3. The remainder of this Act is divided into Parts, as follows: Part I, Inventions; Part II, Designs.

PART I.—INVENTIONS.

Sec. 4. In this Part, unless there is something repugnant in the subject or context,—

(1) "invention" includes an improvement:

(2) "inventor" does not include the importer into British India of a new invention unless he is the actual inventor:

(3) "applicant" means a person who has applied under this Part for leave to file a specification of an invention, whether he has filed the specification or not:

(4) "assign" includes a grantee of the exclusive privilege of making, selling or using an invention, or of authorizing others so to do, during the term for which the privilege is to continue or may be extended, or for any shorter term:

(5) "inventor," "actual inventor" and "applicant" include the executors, administrators or assigns of an inventor, actual inventor and applicant, as the case may be:

(6) "manufacture" includes any art, process or manner of producing, preparing or making an article, and also any article prepared or produced by manufacture:

(7) "writs" includes print, lithograph, photograph, engrave, and every other mode in which words or figures can be expressed on paper or on any substance:

(8) "Secretary" means a Secretary to the Government of India appointed by the Governor General in Council to discharge the functions of the Secretary under this Act, and includes any under-secretary, assistant-secretary or other officer subordinate to the Government of India to the extent to which such officer may be authorised by general or special order of the Governor General in Council to discharge any of those functions:

(9) "District Court" has the meaning assigned to that expression by the Code of Civil Procedure: and

(10) "High Court" has the meaning assigned to that expression by the Code of Criminal Procedure, 1882, in reference to proceedings against European British subjects.

Sec. 5. (1) The inventor of a new manufacture, whether he is a British subject or not, may apply to the Governor General in Council for leave to file a specification thereof.

(2) The application must be in writing signed by the applicant and in the form or to the effect of the second schedule if the inventor has not obtained a patent in the United Kingdom, and in the form or to the effect of the third schedule if he has obtained a patent in the United Kingdom.

(3) It must state the name, occupation and address of the applicant, and, where a patent has been obtained in the United Kingdom, the date of the patent and the date of the actual sealing thereof, and must describe with reasonable precision and detail the nature of the invention, and of the particular novelty whereof it consists, and be supplemented by such further particulars relating to the invention, and by such drawings or photographs illustrative thereof, as the Governor General in Council may see fit to require from the applicant.

(4) If in any case it appears to the Governor General in Council that an application ought to be further supplemented by a model of anything alleged to constitute an invention, he may require the applicant to furnish such a model neatly and substantially made of durable material and of dimensions not exceeding those, if any, specified in the requisition therefor.

Sec. 6. (1) Upon an application under the last foregoing section the Governor General in Council may, after such inquiry as he thinks fit, make an order authorizing the applicant to file a specification of the invention.

(2) Before making an order under sub-section (1), the Governor General in Council may direct that the application be referred for inquiry and report to any person whom he thinks fit.

(3) When such enquiry and report are made by a person who is not in the service of the Government, there shall be payable to that person by the applicant such fee as the Governor General in Council, after considering the report, may determine.

(4) When an application is to be referred to such a person, the applicant shall deposit, in such place and within such time as the Governor General in Council may by rule or otherwise prescribe, such sum as will, in the opinion of the Secretary, be sufficient to defray any fee which is likely to be determined under sub-section (3).

(5) If the sum is not deposited in the place and within the time prescribed, the application may be rejected.

(6) If the fee as determined by the Governor General in Council exceeds the sum so deposited, an order shall not be made under sub-section (1) until the applicant has paid the balance of the fee.

(7) If the sum deposited exceeds the fee so determined, the excess shall be refunded to the applicant.

Sec. 7. (1) If two or more inventors apply on the same day for leave to file specifications of inventions which appear to the Governor General in Council to be identical or so similar as to be practically identical, the Governor General in Council may, in his discretion, authorise both or all the applicants, subject to the other provisions of this Part, to file specifications of their respective inventions.

(2) If they apply on different days for leave to file specifications of such inventions as aforesaid, the applicant who applied on the first of the different days shall be deemed to have a preferential claim to an order authorizing the filing of his specification.

Sec. 8. (1) If within six months from the date of an order under section 6, sub-section (1), or within such further time, not exceeding three months, as the Governor General in Council, in his discretion, may, on cause shown to his satisfaction and on payment of the fee prescribed in that behalf in the fourth schedule, see fit to allow, the applicant causes a specification of his invention to be filed in manner by this Part required, and the fee prescribed in the fourth schedule in respect of the filing of the specification to be paid, the applicant shall, subject to the other provisions of this Part, be entitled to the exclusive privilege of making, selling and using the invention in British India, and of authorizing others so to do, for a term of fourteen years from the date of the filing of the specification.

(2) But an exclusive privilege in respect of an invention of a new manufacture shall, notwithstanding anything in sub-section (1) cease if the inventor fails to pay, within the time limited in that behalf by the fourth schedule, any fee prescribed in that schedule in respect of the continuance of the privilege.

(3) If, nevertheless, in any case, by accident, mistake or inadvertence, an inventor fails to pay any such fee within the time so limited, he may apply to the Governor General in Council for an enlargement of the time for making the payment.

(4) Thereupon the Governor General in Council may enlarge the time accordingly, on payment of the fee prescribed in that behalf in the fourth schedule and subject to the following conditions, namely:—(a) the time for making a payment shall not in any case be enlarged for more than three months; and (b) if any suit is instituted in respect of an infringement of the exclusive privilege committed after a failure to make a payment within the time limited for the making thereof and before the enlargement of that time, the Court disposing of the suit may, if it thinks fit, refuse to award or give any damages in respect of the infringement.

Sec. 9. (1) A specification filed under this Part must be in writing signed by the applicant, and must set forth the precise invention in respect of which the applicant claims to become entitled to an exclusive privilege.

(2) If the specification is of an invention which is an improvement only, it must by explicit language distinguish between what is old and what is claimed to be new.

(3) Every specification must explain the principle of the invention set forth therein and the best mode in which the applicant has contemplated applying that principle, and must describe the manner of making and using the invention in such full, clear, concise and exact terms as to enable any person skilled in the art or science to which the invention appertains, or with which it is most closely connected, to make or use the same.

Sec. 10. Every application for leave to file a specification, and every specification filed under this Part, must be left with, or sent by post to, the Secretary, and the date of the delivery or receipt thereof shall be indorsed thereon and recorded in his office.

Sec. 11. (1) At the time of delivering or sending the specification for the purpose of its being filed, the applicant shall cause to be delivered or sent therewith to the Secretary as many copies thereof, not being fewer than four, as may be required by the rules for the time being in force under this Part.

(2) One of these copies shall be retained by the Secretary, and one shall be sent to the Governor of Fort St. George in Council, one to the Governor of Bombay in Council, one to the Chief Commissioner of Burma, and the others, if any, to such authorities as the Governor General in Council may appoint in this behalf.

(3) The copies of the specification which are sent under sub-section (2) to the authorities mentioned or referred to in that sub-section shall be open to the inspection of any person at all reasonable times at places to be appointed by those authorities.

Sec. 12. (1) A book, to be called the register of inventions, shall be kept in the office of the Secretary wherein shall be entered and recorded every application for leave to file a specification, every order made on any such application, every specification filed in pursuance thereof, and every subsequent proceeding relating to the invention described thereby.

(2) Applications for leave to file a specification shall be numbered consecutively in the order in which they are delivered or received, and be dated as of the day of their delivery or receipt, and shall be entered in the register of inventions in the order of their respective numbers.

(3) A reference shall be made in that register, in the margin of the entry of each application, to every order on or in respect of the application, to the specification, if any, filed in pursuance thereof, and to every subsequent proceeding relating to the invention which forms the subject of the application.

Sec. 13. (1) Another book, to be called the address-book, shall be kept in the office of the Secretary wherein any person filing a specification under this Part, or any person in whom an exclusive privilege acquired under this Part, or any share or interest therein, may become vested, may from time to time cause to be stated some place in British India where notice of any rule or proceeding relating to the exclusive privilege may be served on him.

(2) A reference to each entry in the address-book shall be made in the register of inventions in the margin of the entry in that register of the application for leave to file the specification.

Sec. 14. (1) Every entry in the register of inventions or address-book, and every document entered and recorded in the register, shall, for the purposes of the law of evidence for the time being in force, be deemed to be a public document and shall be open to the inspection of any person at all reasonable times at the office of the Secretary.

(2) The books kept under section 11 and section 35 of Act No. XV of 1859 (*an Act for granting exclusive Privileges to Inventors*) shall be deemed to be parts of the register of inventions and address-book respectively.

Sec. 15. (1) The inventor of a new manufacture may, at any time not more than one year and not less than six months before the time limited for the expiration of an exclusive privilege acquired under section 8, apply to the Governor General in Council for an extension of the privilege for a further term.

(2) When an application is made under sub-section (1), the Governor General in Council may, if he thinks fit, refer it to a High Court for report.

(3) The Court to which the application is referred shall, in making its report, have regard to the nature and merits of the invention in relation to the public, to the profits made by the inventor as such, and to all the circumstances of the case.

(4) The procedure on the reference shall be such as the Court thinks fit, and may include the issue of citations calling upon persons claiming to have any interest in the reference to appear before the Court on the day on which the reference is to be considered, or on any day to which the consideration thereof may be adjourned, and make with respect thereto any representation which they may see fit in relation to any of the matters to which the Court is required by the last foregoing sub-section to have regard in making its report.

(5) If the Governor General in Council is of opinion, or, where a reference has been made under sub-section (2), if the Court reports, that the inventor has been inadequately remunerated by his exclusive privilege, the Governor General in Council may, on payment of the fee prescribed in that behalf in the fourth schedule, make an order extending the term of the privilege for a further term not exceeding seven or, in exceptional cases, fourteen years from the expiration of the first term of fourteen years.

(6) But an exclusive privilege of which the term has been extended under the last foregoing sub-section shall, notwithstanding anything in that sub-section, cease if the inventor fails to pay before the expiration of each year of such extended term the fee prescribed in the schedule aforesaid in respect of the continuance of the privilege.

Sec. 16. An order under section 6, sub-section (1), authorizing the filing of a specification, or under section 15, sub-section (5), extending the term of an exclusive privilege, may be made subject to such conditions as the Governor General in Council thinks expedient.

Sec. 17. (1) Subject to any conditions imposed under the last foregoing section—(a) with respect to the filing, by a person employed in the service of Her Majesty in India, of the specification of a manufacture invented by him in the course of his employment, or (b) with respect to the extension, in favour of any person, of the term of an exclusive privilege, an exclusive privilege acquired under this Part shall have to all intents the like effect as against Her Majesty as it has against a subject.

(2) But the officers or authorities administering any department of the service of Her Majesty may, by themselves, their agents, contractors or others, at any time after the delivery or receipt of the application for leave to file the specification of an invention, use the invention for the services of the Government on terms to be before or after the use thereof agreed on, with the approval of the Governor General in Council, between those officers or authorities and the inventor, or, in default of such agreement, on such terms as may be settled by the Governor General in Council.

Sec. 18. (1) If, after the filing of the specification, the applicant has reason to believe that through mistake or inadvertence he has erroneously made any mis-statement in his application or specification or included therein something which at the date of the delivery or receipt of his application was not new or whereof he was not the inventor, or that the specification is in any particular defective or insufficient, he may apply to the Governor General in Council for leave to file a memorandum pointing out the mis-statement or disclaiming any part of the alleged invention, or for leave to file an amended specification, as the case may be.

(2) The application must be in writing signed by the applicant, and must state how the error, defect or insufficiency occurred and that it was not fraudulently intended.

(3) Upon the application the Governor General in Council may make an order allowing the memorandum or amended specification to be filed.

(4) The provisions of section 6 with respect to applications, and of sections 9 and 11 with respect to specifications and copies thereof, shall apply, so far as they can be made applicable, to applications and to amended specifications, respectively, made and filed under this section.

Sec. 19. An amended specification filed under the last foregoing section shall, except as to any suit or proceeding relating to the exclusive privilege which may be pending at the time of the filing of the amended specification, have the same effect as if it had been the specification first filed:

Provided that nothing in an amended specification shall be construed to extend or enlarge an exclusive privilege before acquired.

Sec. 20. A person shall not be entitled to an exclusive privilege under this Part—(a) if the invention is of no utility, or (b) if the invention, at the date of the delivery or receipt of the application for leave to file the specification thereof, was not a new invention within the meaning of this Part, or (c) if the applicant is not the inventor thereof, or (d) if the original or any amended specification does not fulfil the requirements of this Part, or (e) if the original or any subsequent application relating to the invention or the original or any amended specification contains a wilful or fraudulent mis-statement, or (f) if the application for leave to file the specification of the invention was made under this Part after the expiration of one year from the date of the acquisition of an exclusive privilege in respect of the invention in any place beyond the limits of British India and the United Kingdom.

Sec. 21. An invention shall be deemed a new invention within the meaning of this Part if it has not before the date of the delivery or receipt of the application for leave to file the specification thereof been publicly used in any part of British India or of the United Kingdom, or been made publicly known in any part of British India or of the United Kingdom by means of a written publication.

Sec. 22. The public use or knowledge of an invention before the date of the delivery or receipt of the application for leave to file a specification thereof shall not be deemed a public use or knowledge within the meaning of this Part if the knowledge has been obtained surreptitiously or in fraud of the inventor or has been communicated to the public in fraud of the inventor or in breach of confidence:

Provided that the inventor has not acquiesced in the public use of his invention, and that, within six months after the commencement of that use, he applies for leave to file a specification.

Sec. 23. Use of an invention in public by the inventor thereof, or by his servant or agent, or by any other person by his license in writing, for a period not exceeding one year immediately preceding the date of the delivery or receipt of his application for leave to file a specification thereof, or knowledge of the invention resulting from such use thereof in public, shall not be deemed a public use or knowledge within the meaning of this Part.

Sec. 24. If an inventor who has obtained a patent for his invention in the United Kingdom causes an application for leave to file a specification of the invention under this Part to be delivered or received by the Secretary within twelve months from the date of the actual sealing of the patent, the invention shall be deemed a new invention within the meaning of this Part if it was not publicly used or known in any part of British India at or before the date of the application for the patent, notwithstanding that it may have been publicly used or known in some part of British India or of the United Kingdom before the date of the delivery or receipt of the application under this Part for leave to file the specification.

Sec. 25. If an inventor applies for leave to file a specification under this Part while his application for a patent is pending in the United Kingdom, and the interval between the date of his application for the patent and the date of the delivery or receipt of his application under this Part does not exceed twelve months, the invention shall not be deemed to have been publicly used, or made publicly known, within the meaning of this Part, by reason only of the invention having been used, or a description thereof having been published, in any part of British India or of the United Kingdom during the interval.

Sec. 26. If an inventor, being the exhibitor of his invention at an industrial or international exhibition, certified as such by the Governor General in Council, causes an application for leave to file a specification of the invention to be delivered to or received by the Secretary within six months from the date of the admission of the invention into that exhibition, the invention shall not be deemed to have been publicly used, or made publicly known, within the meaning of this Part, by reason only of the invention having at any time after admission into the exhibition been publicly used or made publicly known.

Sec. 27. (1) An exclusive privilege acquired under this Part shall cease if the Governor General in Council declares the privilege, or the mode in which it is exercised, to be mischievous to the State, or generally prejudicial to the public.

(2) It shall also cease if a breach of any condition on which the applicant was authorized to file a specification, or on which the term of the exclusive privilege was extended, is on an application under this Part to a High Court proved to the satisfaction of that Court, and if the Governor General in Council thereupon declares the privilege to have ceased.

Sec. 28. (1) An exclusive privilege acquired under this Part in respect of an invention for which a patent has been obtained in the United Kingdom shall cease on the revocation or expiration of the patent.

(2) Such a privilege in respect of an invention for which a patent has not been obtained in the United Kingdom shall cease on the revocation or expiration of any patent or exclusive privilege which has been obtained or acquired for or in respect of the invention in any other country.

Sec. 29. (1) An inventor may institute a suit in the District Court against any person who, during the continuance of an exclusive privilege acquired by him under this Part in respect of an invention, makes, sells or uses the invention without his license, or counterfeits or imitates it.

(2) The suit shall not be defended upon the ground of any defect or insufficiency of the specification of the invention, or upon the ground that the original or any subsequent application relating to the invention, or the original or any amended specification, contains a wilful or fraudulent mis-statement, or upon the ground that the invention is of no utility.

(3) Nor shall it be defended upon the ground that the plaintiff was not the inventor, unless the defendant shows that he himself is the actual inventor or has obtained from the actual inventor a right to make, sell or use the invention, or to counterfeit or imitate it, as the case may be:

(4) Nor shall it be defended upon the ground that the invention was not new, unless the defendant, or some person through whom he claims, has, before the date of the delivery or receipt of the application for leave to file the specification, publicly or actually used in some part of British India or of the United Kingdom the invention or that part of it with respect to which the exclusive privilege is alleged to have been infringed.

Sec. 30. Any person may apply to a High Court for a rule to show cause why the Court should not declare that an exclusive privilege in respect of an invention to be specified in the rule has not been acquired under this Part by reason of all or any of the objections following (to be specified in the rule), that is to say:—(a) that the invention is of no utility, or (b) that the invention was not, at the date of the delivery or receipt of the application for leave to file the specification, a new invention within the meaning of this Part, or (c) that the applicant was not the inventor thereof, or (d) that the original or any amended specification does not fulfil the requirements of this Part, or (e) that the applicant has knowingly or fraudulently included in the application for leave to file the specification or in the original or any amended specification, as part of his invention, something which was not new or whereof he was not the inventor, or (f) that the original or any subsequent application relating to the invention, or the original or any amended specification, contains a wilful or fraudulent mis-statement, or (g) that some part of the invention, or the manner in which that part is to be made and used, as described in the original or any amended specification, is not thereby sufficiently described, and that this insufficiency was fraudulent and is injurious to the public.

Sec. 31. Any person may apply to a High Court for a rule to show cause why the Court should not declare that an exclusive privilege in respect of any part of an invention, to be specified in the rule has not been acquired under this Part, by reason of all or any of the objections following (to be specified in the rule) that is to say:—(a) that that part of the invention is wholly distinct from the other parts thereof and is of no utility, or (b) that that part of the invention was not, at the date of the delivery of receipt of the application for leave to file the specification, a new invention within the meaning of this Part, or (c) that the applicant was not the inventor of that part of the invention, or (d) that that part of the invention, or the manner in which it is to be made and used, is not sufficiently described in the original or any amended specification, and that this insufficiency is injurious to the public.

Sec. 32. The High Court may, irrespective of any provisions of the Code of Civil Procedure in this behalf, require a person applying for a rule under either of the two last foregoing sections to give security for the payment of all costs incurred or likely to be incurred by any person appearing to show cause against the rule.

Sec. 33. (1) Any person authorised by the Governor General in Council in this behalf may apply to a High Court for rule to show cause why the question of the breach of any condition on which leave to file a specification has been granted, or any other question of fact on which the cessation of an exclusive privilege under section 27 may, in the judgment of the Governor General in Council, depend, should not be tried in the form of an issue directed by the Court.

(2) If the rule is made absolute, the Court, unless the breach or other matter of fact is admitted, may direct the issue to be tried and certify the result of the trial to the Governor General in Council.

Sec. 34. (1) Notice of any rule obtained or proceeding taken under section 30, section 31 or section 33 shall be served on all persons appearing from the address-book to be proprietors of the exclusive privilege, or to have shares or interests therein, and it shall not be necessary to serve the notice on any other person.

(2) The notice shall be deemed to be sufficiently served if a copy thereof is left at the place for the time being stated in the address-book, by delivering the copy to any person resident at or in charge of the place or, if there is no person resident at or in charge of the place, or if the place is not within the local limits of the jurisdiction of the Court, by causing the notice to be sent to the place by post by a registered letter directed to the person to whom the notice is addressed.

Sec. 35. (1) The High Court may, if it thinks fit, direct an issue for the trial, before itself or any other High Court, or any District Court, of any question of fact arising upon an application under section 30, section 31 or section 33, and the issue shall be tried accordingly.

(2) If the issue is directed to another Court, the finding shall be certified by that Court to the Court directing the issue.

(3) If the issue is directed to a District Court, the finding of that Court shall not be subject to appeal, but the evidence taken upon the trial shall be recorded, and a copy thereof, certified by the Judge of the Court, shall be transmitted, together with any remarks which he may think fit to make thereon, to the High Court, and the High Court may thereupon act upon the finding of the District Court, or dispose of the application upon the evidence recorded, or direct a new trial, as the justice of the case may require.

Sec. 36. (1) If it appears to the High Court at the hearing of an application under section 30 or section 31 that, by reason of any of the objections specified in the rule, the exclusive privilege in the invention or in any part thereof has not been acquired, the Court shall make an order accordingly, and thereupon the applicant shall, so long as the order continues in force, cease to be entitled to the exclusive privilege.

(2) If it appears to the High Court, at the hearing of any such application as last aforesaid, that the applicant has, in the description of his invention in the application for leave to file a specification thereof or in the original or any amended specification, erroneously included something which at the date of the delivery or receipt of the application for leave to file the specification was not new or whereof he was not the inventor, or that the specification is in any particular defective or insufficient, but that the error, defect or insufficiency was not fraudulently intended, the Court may adjudge the exclusive privilege to have been acquired and to be valid, save as to the part thereof affected by the error, defect or insufficiency; or

(3) If it appears to the High Court that the error, defect or insufficiency can be amended without injury to the public, the Court may adjudge the exclusive privilege in respect of the whole of the invention to be valid, and may, upon such terms as it thinks reasonable, order the specification to be amended in any particular in which it is erroneous, defective or insufficient; and thereupon the applicant shall, within a time to be limited by the Court for the purpose, file in the office of the Secretary a specification amended according to the order.

(4) The provisions of section 18 with respect to the distribution and dispersal of copies of amended specifications, and of section 19 with respect to the effect of such specifications, shall apply, so far as they can be made applicable, to an amended specification filed under this section.

(5) An exclusive privilege in respect of an invention shall not be defeated upon the ground that the application for leave to file the specification of the invention contains a mis-statement, unless the mis-statement was wilful or fraudulent.

Sec. 37. (1) In a suit for the infringement of an exclusive privilege acquired under this Part the plaintiff shall deliver with his plaint particulars of the breaches complained of in the suit, and the defendant shall deliver a written statement of the particulars of the grounds, if any, upon which he means to contend that the plaintiff is not entitled to an exclusive privilege in respect of the invention.

(2) In like manner, upon an application to a High Court under section 30, section 31 or section 33, the person making the application shall deliver particulars of the objections or grounds on which he means to rely.

(3) At the hearing of any such suit or application, or at the trial of any issue arising out of any such application, evidence shall not be allowed to be given in proof of any breach of the exclusive privilege, or of any ground impeaching the validity of that privilege, or of any objection or ground affecting such a privilege, unless such breach or other matter as aforesaid has been stated in the particulars delivered under this section.

(4) If it is alleged that the invention was publicly used or known before the date of the delivery or receipt of the application for leave to file the specification thereof, the places where and the manner in which the invention was so publicly used or known shall be stated in the particulars.

(5) Notwithstanding anything in the foregoing portion of this section, the Court in which the suit or application is pending, or an issue arising out of the application is being tried, may allow the plaintiff or defendant respectively to amend the particulars delivered under this section upon such terms as it thinks fit.

Sec. 38. If, in a suit instituted in the District Court at any time within fourteen years from the date of the filing of a specification of an invention under this Part, the actual inventor proves to the satisfaction of the Court that the applicant was not the actual inventor, and that at the time of the application for leave to file the specification the applicant knew or had reason to believe that the knowledge of the invention was obtained by himself or by some other person surreptitiously or in fraud of the actual inventor, or by means of a communication made in confidence by the actual inventor to him or to any person through whom he derived the knowledge, the Court may make a decree declaring an exclusive privilege in respect of the invention to be vested, subject to the other provisions of this Part, in the actual inventor for a term of fourteen years from the date on which the specification was filed, and requiring the applicant to account for and pay over to the actual inventor the profits derived by him from the invention or so much of those profits as the Court, having regard to the degree of diligence exerted by the actual inventor in proceeding under this section and to all the other circumstances of the case, may see fit to require the applicant to pay.

Sec. 39. A Court making a decree in a suit under section 29 or section 38, or an order on an application under section 30, section 31 or section 33, shall send a copy of the decree or order, as the case may be, to the Secretary, who shall cause an entry thereof and reference thereto to be made in the register of inventions and against any entry in the address-book affected thereby.

Sec. 40. In the following cases, namely:—(a) when an exclusive privilege acquired under this Part has ceased under section 8 or section 15 by reason of a fee in respect of the continuance of the privilege not having been paid within the time limited by the fourth schedule for the payment thereof, and the period, if any, within which an order might have been made for enlarging the time for the making of the payment has expired; (b) when an exclusive privilege acquired under this Part has been declared by the Governor General in Council under section 27 to have ceased; (c) when an exclusive privilege acquired under this Part has ceased under section 28 by reason of the revocation or expiration of a patent or exclusive privilege; (d) when the whole or any part of an exclusive privilege acquired under this Part has ceased under section 36 in consequence of an order under that section; (e) when an exclusive privilege has been declared by a decree to have vested in an actual inventor under section 38; (f) when an exclusive privilege acquired under this Part has ceased by reason of the expiration of the term for which it was acquired; the Secretary shall cause an entry with respect to the cessation or vesting of the exclusive privilege to be made in the register of inventions, and a reference to that entry to be made in the margin of the entry in that register of the application for leave to file the specification of the inventor.

Sec. 41. (1) If any person is aggrieved by an entry in the register of inventions or address-book, or by the omission of an entry therefrom, and a proceeding is not provided in the foregoing portion of this Part whereby the register or book may be rectified, he may apply to a High Court for an order for the rectification of the register or book, and the Court may make such order on the application as it thinks fit.

(2) A copy of the order shall be forwarded by the Court to the Secretary, who shall cause an entry thereof and reference thereto to be made in the register of inventions and against any entry in the address-book affected thereby.

(3) When the Secretary is a party to an application under this section, the costs of another party thereto shall not be adjudged to be payable by the Secretary.

Sec. 42. A High Court to which an application has been made under section 30, section 31, section 33 or section 41 may stay proceedings on, or dismiss, the application if in its opinion the application would be disposed of more justly or conveniently by another High Court.

Sec. 43. If on the petition of any person interested it is proved to the Governor General in Council that, by reason of an inventor who has acquired an exclusive privilege under this Part failing to grant licenses on reasonable terms,—(a) the exclusive privilege is not being worked in British India, or (b) the reasonable requirements of the public with respect to the invention cannot be supplied, or (c) any person is prevented from working or using to the best advantage an invention of which he is possessed, the Governor General in Council may order the inventor to grant, or may himself on behalf of the inventor grant, licenses on such terms as to the amount of royalties, security for payment, or otherwise, as the Governor General in Council, having regard to the nature of the invention and the circumstances of the case, may deem just.

Sec. 44. Any person for the time being entitled to an exclusive privilege under this Part, or to any share or interest in such a privilege, in any local area may, subject to the conditions of his title thereto, assign the privilege or such share or interest, as the case may be, for any place in or part of that local area.

Sec. 45. If an applicant is absent from British India, an application for leave to file a specification, or a specification, or an application for leave to file a memorandum or amended specification, may, instead of being signed by the applicant under section 5, section 9 or section 18, as the case may be, be signed on behalf of the applicant by an agent in British India authorised by him in writing in that behalf.

Sec. 46. (1) An application under this Part for leave to file a specification, memorandum or amended specification must be verified by the person making the application.

(2) If that person is absent from British India, the application may be verified by the agent who signs the application on his behalf.

(3) The verification must be signed by the person making it, and must be to the effect that the facts stated in the application are true to his knowledge, except as to matters stated on information and belief, and that as to those matters he believes them to be true.

Sec. 47. Subject to the provisions of the two last foregoing sections and of any other enactment for the time being in force, any act which is required or authorised by this Part to be done by any person may be done on his behalf by an agent in British India having authority in writing from that person so to do the act.

Sec. 48. (1) There shall be paid in respect of the several proceedings specified in the fourth schedule the fees in that schedule prescribed.

(2) The Governor General in Council may, if he thinks fit, reduce any of those fees and revoke or vary the reduction.

(3) The fees payable under this section shall be collected by means of stamps or otherwise as the Governor General in Council directs.

(4) A proceeding in respect of which a fee is payable under the fourth schedule shall be of no effect unless the fee has been paid.

Sec. 49. (1) The Governor General in Council may make such rules and prescribe such forms as he thinks necessary for carrying out the purposes of this Part, and may alter or amend either of the forms in the second and third schedules.

(2) Rules under this section may provide, among other matters, for the printing of specifications, memoranda and amended specifications, and for the distribution or sale of printed copies thereof.

PART II.—DESIGNS.

Sec. 50. In this Part, unless there is something repugnant in the subject or context,—

(1) "design" means some peculiar shape, configuration or

form given to an article, or arrangement of lines or the like used on or with an article; but not the article itself:

(2) "copyright" means the exclusive right to apply a design to an article:

(3) the author of any new and original design shall be considered the "proprietor" thereof, unless he executed the work on behalf of another person for a good or valuable consideration, in which case that person shall be considered the "proprietor," and every person acquiring for a good or valuable consideration a new and original design, or the right to apply the same to an article, either exclusively of any other person or otherwise, and also every person on whom the property in the design or the right to the application thereof shall devolve, shall be considered the "proprietor" of the design in the respect in which the same may have been so acquired, and to that extent, but not otherwise: and

(4) "Secretary," "District Court" and "High Court" have the same meanings as in Part I.

Sec. 51. (1) Any person, whether a British subject or not, claiming to be the proprietor of any new and original design not previously published in British India may apply to the Governor General in Council for an order for the registration of the design.

(2) The application must be in writing in the form or to the effect of the fifth schedule, and must contain a statement of the nature of the design and be accompanied by as many copies of drawings, photographs or tracings thereof, not being fewer than four, as may be required by the rules for the time being in force under this Part.

(3) It must be left with, or sent by post to, the Secretary, and the date of the delivery or receipt thereof in the office of the Secretary shall be indorsed thereon and recorded in that office.

Sec. 52. (1) Upon the application the Governor General in Council may, after such inquiry as he thinks fit, make an order authorizing the registration of the design.

(2) When an order has been made under sub-section (1), the Secretary shall cause the design to be registered in a book to be kept by him for the purpose and to be called the register of designs.

(3) The date of registration shall be recorded in the register.

Sec. 53. When a design is registered, the proprietor thereof shall, subject to the other provisions of this Part, have copyright in the design during five years from the date of registration.

Sec. 54. (1) Before delivery on sale of any article to which a registered design has been applied, the proprietor of the design shall cause the article to be marked with the word "registered" either in full or in an abbreviated form.

(2) If he fails to cause the article to be so marked, the copyright in the design shall cease unless the proprietor shows that he took all proper steps to insure the marking of the article.

Sec. 55. If the proprietor of a design exhibited at an industrial or international exhibition, certified as such by the Governor General in Council, causes an application for an order for the registration of the design to be delivered to or received by the Secretary within six months from the date of the admission of the design into that exhibition, the design shall not be deemed not to be a new and original design not previously published in British India within the meaning of section 51 by reason only of the design having been exhibited at the exhibition.

Sec. 56. Any person in whom the copyright in a design has become vested may apply to the Secretary for the entry of his name in the register of designs as proprietor of the copyright, and the Secretary may, if he sees fit, cause the entry to be made.

Sec. 57. (1) The registered proprietor of a design may institute a suit in the District Court for the recovery of any damages arising from the application by any person to any article of the design or of any fraudulent or obvious imitation thereof for the purpose of sale, or from the publication, sale or exposure for sale by any person of any article to which the design, or any fraudulent or obvious imitation thereof, has been applied, that person knowing or having reason to believe that the proprietor had not given his consent to such application.

(2) When the Court makes a decree in a suit under this section, it shall send a copy of the decree to the Secretary, who shall cause an entry thereof to be made in the register of designs.

Sec. 58. (1) When, from the expiration of the term of a copyright or from any other cause, the copyright in a design has ceased, the Secretary shall cause an entry with respect to the cessation of the right to be made in the register of designs.

Sec. 59. (1) A High Court may, on the application of any person aggrieved by an entry in the register of designs, or by the omission of an entry therefrom, make such order for the rectification of the register as it thinks fit.

(2) An order under sub-section (1) may declare copyright in a design not to have been acquired.

(3) A copy of the order shall be forwarded by the Court to the Secretary, who shall cause an entry thereof to be made in the register of designs.

(4) When the Secretary is a party to an application under this section, the costs of another party thereto shall not be adjudged to be payable by the Secretary.

Sec. 60. A High Court to which an application has been made under the last foregoing section may stay proceedings on, or dismiss, the application if, in its opinion, the application would be disposed of more justly or conveniently by another High Court.

Sec. 61. The provisions of the following portions of Part I, namely:—(a) section 11, with respect to copies of specifications, (b) section 14, with respect to the register of inventions and the matters entered therein, and (c) section 47, with respect to the performance by an agent of any act required or authorised by that Part to be done by a principal, shall, so far as they can be made applicable, apply, respectively, to—(a) copies of drawings, photographs or tracings accompanying an application for an order for the registration of a design in respect of which such an order has been made, (b) the register of designs and the matters entered and documents referred to therein, and (c) the performance by an agent of any act required or authorised by this Part to be done by a principal.

Sec. 62. (1) There shall be paid in respect of the several proceedings specified in the sixth schedule the fees in that schedule prescribed.

(2) The Governor General in Council may, if he thinks fit, reduce any of those fees and revoke or vary the reduction.

(3) The fees payable under this section shall be collected by means of stamps or otherwise as the Governor General in Council may direct.

(4) A proceeding in respect of which a fee is payable under the sixth schedule shall be of no effect unless the fee has been paid.

Sec. 63. The Governor General in Council may make such rules and prescribe such forms as he thinks necessary for carrying out the purposes of this Part, and may alter or amend the form in the fifth schedule.

THE FIRST SCHEDULE.

Enactments repealed. (*See Sec.* 2.)

No. and year.	Subject or title.	Extent of repeal.
XV of 1859 ...	For granting exclusive privileges to inventors.	So much as has not been repealed.
XIII of 1872....	Patterns and Designs Protection Act, 1872.	So much as has not been repealed.
XVI of 1883....	Protection of Inventions Act, 1883.	The whole.
I of 1879	Indian Stamp Act, 1879.	Article 48, Schedule I.

THE SECOND SCHEDULE.

Application where Patent has not been obtained. (*See Secs.* 5 *and* 49.)

To the Governor General in Council.

The application of (*here insert name, occupation and address*) for leave to file a specification under Part I of the Inventions and Designs Act, 1888.

1. The applicant is in possession of an invention for (*state the title of the invention*); he is the inventor thereof (*or, as the case may be, the executor, administrator or assign of the inventor*); and, to the best of his information and belief, the invention is new within the meaning of Part I of the Inventions and Designs Act, 1888, and no circumstance exists which, if the applicant is authorised to file a specification and files it in accordance with that Part, will disentitle him to an exclusive privilege thereunder in respect of the invention.

2. The following is a description of the invention (*here describe it and the particular novelty whereof it consists*).

3. The applicant therefore applies for leave to file a specification of the invention pursuant to Part I of the Inventions and Designs Act, 1888.

(*Signature and verification.*)

THE THIRD SCHEDULE.

Application where Patent has been obtained. (*See Secs.* 5 *and* 49.)

To the Governor General in Council.

The application of (*here insert name, occupation and address*) for leave to file a specification under Part I of the Inventions and Designs Act, 1888.

1. The applicant (*or, as the case may be, A. B. of whom the applicant is the executor, administrator or assign*) has obtained a patent in the United Kingdom dated and sealed as of the —— day of ——, and actually sealed on the —— day of ——, for (*state the title of the invention*).

2. To the best of the information and belief of the applicant, the invention is new within the meaning of Part I of the Inventions and Designs Act, 1888, and no circumstance exists which, if the applicant is authorised to file a specification and files it in accordance with that Part, will disentitle him to an exclusive privilege thereunder in respect of the invention.

3. The following is a description of the invention (*here describe it and the particular novelty whereof it consists*).

4. The applicant therefore applies for leave to file a specification of the invention pursuant to Part I of the Inventions and Designs Act, 1888.

(*Signature and verification.*)

THE FOURTH SCHEDULE.

Fees, Inventions. (*See Secs.* 8, 15 *and* 48.)

	Rs.	a.	p.
(1) in respect of an application for leave to file a specification (Sec. 5)	10	0	0
(2) in respect of the filing of a specification (Sec. 8)	20	0	0
(3) in respect of an extension of the time for filing a specification (Sec. 8)	20	0	0
(4) in respect of the continuance of an exclusive privilege (Sec. 8)—			
(*a*) after the filing of the specification and before the expiration of the fourth year from the date of the filing thereof	50	0	0
(*b*) after the expiration of the fourth year and before the expiration of the fifth year from that date	50	0	0
(*c*) after the expiration of the fifth year and before the expiration of the sixth year from that date	50	0	0
(*d*) after the expiration of the sixth year and before the expiration of the seventh year from that date	50	0	0
(*e*) after the expiration of the seventh year and before the expiration of the eighth year from that date	50	0	0
(*f*) after the expiration of the eighth year and before the expiration of the ninth year from that date	100	0	0
(*g*) after the expiration of the ninth year and before the expiration of the tenth year from that date	100	0	0
(*h*) after the expiration of the tenth year and before the expiration of the eleventh year from that date	100	0	0
(*i*) after the expiration of the eleventh year and before the expiration of the twelfth year from that date	100	0	0
(*j*) after the expiration of the twelfth year and before the expiration of the thirteenth year from that date	100	0	0
Provided that the inventor may pay the sum total of the said fees in respect of the continuance of the exclusive privilege, or any part thereof short of the sum total, at any time before the same falls due.			
(5) in respect of an enlargement of the time for payment of a fee under article (4) of this schedule (Sec. 8)—			
(*i*) if the enlargement does not exceed one month	10	0	0
(*ii*) if the enlargement exceeds one month, but does not exceed two months	25	0	0
(*iii*) if the enlargement exceeds two months	50	0	0
(6) in respect of an application for an extension of an exclusive privilege for a further term (Sec. 15)	50	0	0
(7) in respect of an order extending the term of an exclusive privilege (Sec. 15)	100	0	0
(8) in respect of the continuance of an exclusive privilege of which the term has been extended (Sec. 15)	100	0	0 to be paid before the expiration of each year of the extended term:
Provided that the inventor may pay the sum total of the said fees in respect of the continuance of the exclusive privilege, or any part thereof short of the sum total, at any time before the same falls due.			
(9) in respect of an application for leave to file a memorandum or amended specification (Sec. 18)	20	0	0
(10) in respect of a petition to the Governor General in Council for a compulsory license (Sec. 43)	50	0	0
(11) for the inspection of any book or other document which is open to inspection under Part I	1	0	0
(12) for copies—			
(*a*) when the number of words copied does not exceed four hundred	1	0	0
(*b*) for every hundred words in excess of four hundred	0	4	0
(*c*) of drawings or photographs	cost according to agreement.		
(13) for certifying copies— for every hundred words	0	2	0

THE FIFTH SCHEDULE.

Application for Order for Registration of Design. (*See Secs.* 51 *and* 63.)

The application of (*here insert name, occupation and address*) for an order for the registration of a design under Part II of the Inventions and Designs Act, 1888.

1. The applicant claims to be the proprietor of the design of which the nature is hereinafter stated.

2. To the best of his information and belief, that design is within the meaning of Part II of the Inventions and Designs Act, 1888, a new and original design not previously published in British India.

3. copies of (*drawings*), (*photographs*), (*tracings*) of the design accompany this application.

4. The following is a statement of the nature of the design (*here describe its nature*).

5. The applicant therefore applies for an order for the registration of the design pursuant to Part II of the Inventions and Designs Act, 1888.

(*Signature.*)

THE SIXTH SCHEDULE.

Fees, Designs. (*See Sec.* 62.)

	Rs.	a.	p.
(1) in respect of an application for an order for the registration of a design (Sec. 51)	10	0	0
(2) in respect of a mutation of names in the register of designs (Sec. 56)	5	0	0
(3) for the inspection of any book or other document which is open to inspection under Part II	1	0	0
(4) for copies—			
(*a*) when the number of words copied does not exceed four hundred	1	0	0
(*b*) for every hundred words in excess of four hundred	0	4	0
(*c*) of drawings, photographs or tracings	cost according to agreement.		
(5) for certifying copies— for every hundred words	0	2	0

S. HARVEY JAMES,
Secretary to the Government of India.

INDEX TO DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS

IN THE MATTER OF

PATENTS, TRADE-MARKS, &c.

OFFICIAL GAZETTE—April–June, 1888.

VOL. 43 O. G.—2

INDEX TO DECISIONS.

DIGEST OF DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS

IN THE MATTER OF

PATENTS, TRADE-MARKS, &c.

OFFICIAL GAZETTE—April–June, 1888.

DIGEST OF DECISIONS.

[Decisions of the United States courts designated by an asterisk (*), and of State courts by a dagger (†).]

ABANDONED APPLICATIONS.

(See Withdrawal of Case from Issue, 1.)

ABANDONMENT.

(See Diligence; Reissues, 1, 3.)

ABANDONMENT OF ONE FORM OF PRODUCT NO PROOF OF ABANDONMENT OF PROCESS.

The fact of the abandonment of the manufacture prior to the date of the complainant's invention of asphalt blocks composed of a composition containing the same ingredients as the alleged infringing blocks, presumably because the blocks were not a commercial success, proves nothing, it not appearing that the composition of matter produced by the practice of the complainant's process had ever been tested to prove its possession of new or useful qualities which similar compositions had not before possessed.

[*Van Camp v. The Maryland Pavement Company, 884.

ACQUIESCENCE.

(See Reissues, 7.)

ACTION AT LAW.

(See Damages and Profits, 5.)

AGGREGATION.

(See Invention, 4, 6; Particular Patents, 26.)

AMENDMENTS.

(See Division of Application; Reissues, 7; Withdrawal of Case from Issue.)

1. REFUSAL OF EXAMINER TO RECEIVE AMENDMENTS WHICH DID NOT CURE DEFECT IN ORIGINAL SPECIFICATION.

Applicant has been required to amend his claim by erasing the words "or equivalents." Acquiescing in such requirement, applicant seeks to amend by inserting a description of a device asserted to be the equivalent of that originally described and shown. The examiner refused to enter the amendment, and applicant appeals to the Commissioner. *Held* that the action of the examiner was correct for the following reasons:

The proposed amendment did not cure any defect in the original specification, for the invention therein described was complete and operative. It added nothing which had been omitted, nor omitted anything which ought not to have been originally inserted. [*Ex parte* Johnson, 507.

2. SAME.

The proposed amendment did not explain any matters set forth originally. It simply described in detail devices not originally disclosed, and broadened the scope of the claims which contained the parts of the newly-described devices which are said to be the equivalents of those originally set forth but from which they differ in construction. [Id.

3. SAME—NEW MATTER.

The proposed amendment involved *new matter*, and would compel the Office to pass upon the merits of each newly-introduced device in order to determine the question of equivalency. [Id.

4. SAME—GENUS AND SPECIES.

The proposed amendment would have the effect of permitting applicant to add new and different species—would be analogous to permitting an applicant who originally claimed a genus and one species to amend by adding other species which he did not claim or show, although they might to some extent illustrate the nature and character of the invention. [Id.

5. SAME.

The admission of such amendments would permit an applicant to make a picture-gallery of his application by introducing all the known forms of what might be equivalents, and thus secure an examination of each device. [Id.

6. SAME—ELECTION—DILIGENCE.

An applicant who in his application has elected, through mistake or ignorance, to prosecute claims for one invention must exercise diligence in presenting his amendment correcting such error, and this before the application has been examined and rejected. [*Ex parte* Zabel, 647.

7. SAME—SEPARATE INVENTION.

The examiner was right in refusing to admit an amendment covering a distinct and separate invention from that originally retained and prosecuted to rejection. To enter and consider such an amendment would be to permit the applicant to secure examination of two distinct inventions for one fee. [Id.

AMENDMENTS TO PRELIMINARY STATEMENTS.

(See Preliminary Statements.)

ANALOGOUS DEVICES.

(See Infringement, 5; Particular Patents, 15, 27.)

ANSWER TO BILL.

(See Defense, 2.)

ANTICIPATION.

(See Particular Patents, 8, 10, 12, 25; Preliminary Statement.)

APPEALS.

(See Design Patents, 6.)

APPLICATIONS.

(See Amendments, 6, 7; Application of Executor or Administrator; Claims; Division of Application; Oath in Relation to Foreign Patents; Reservation for Subsequent Patent, 2, 3.)

APPLICATION BY EXECUTOR OR ADMINISTRATOR.

1. SECTION 4896 REVISED STATUTES CONSTRUED.

Section 4896 Revised Statutes construed in connection with the right of the executor or administrator to prosecute the application of a deceased inventor or to file a new application for the invention of the decedent. [*Ex parte* Smith, 505.

2. CONTINUOUS APPLICATION.
Should the executor elect to pay a new fee and file a new application for the invention of the decedent, instead of continuing the prosecution of the original application, the application so filed by the executor should be entitled to the same status and precedence in order of examination as the application of the decedent. Such application is merely a revival and continuation of the original application, and should receive the same action and consideration which belonged to the original application had death not intervened and arrested the progress of decedent's case. [Id.

ASSIGNEE.

RIGHTS OF ASSIGNEES.
The rights of assignees under the joint patent are protected, for if the sole applicant has assigned and transferred all the right and title which he had in the invention, then such assignees become the owners of the sole invention, and the Office, if satisfied on this point, would permit them to take charge of and control all proceedings had in and under the sole application. [*Kohler v. Kohler and Chambers, 247.

ASSIGNMENTS.

(See Damages and Profits, 2.)

1. ORDER OF INSPECTION TO DETERMINE IDENTITY OF INVENTION.
In a proceeding under a bill in equity alleging the assignment of an invention to the complainant and the identity of said invention with an invention alleged by the defendant to have been subsequently made by him and not assigned, and also alleging the consequent ownership by the complainant of both inventions, apparatus embodying both of said inventions being in possession of the defendant and inaccessible to the complainant, the equities of the bill resting upon an affidavit of the complainant, and the allegations of the complainant's bill and affidavit being denied by the counter-affidavit of the defendant, a court in equity will conclude that the alleged *prima facie* rights of the complainant have been sufficiently established to support a reasonable expectation that an examination of the machines alleged to embody said inventions will aid the administration of justice. In such case a court in equity has the inherent power, on motion of the complainant, to grant him an order of inspection of the apparatus in possession of the defendant which is alleged to embody the inventions in controversy, to the end that the complainant may be enabled to adduce evidence in support of the allegations of his bill.
[†Wilson v. Keely, 511.

2. SAME.
Where an invention was assigned to the complainant in the year 1869, and shortly thereafter the defendant alleged to the complainant that the embodiment of it (said invention) in a working machine proved it to be impracticable and unsatisfactory, and where the complainant, by reason of the representations of the defendant, was led to believe that said invention had been abandoned and thrown aside, and, relying upon said representations, rested for a period of nineteen years before asserting his rights in and to said invention, having only a short time before asserting said rights become aware of the fact that said assigned invention had not been abandoned, but that it was in fact the same in principle and mode of operation as an invention at that time alleged by the defendant to be a practical one, a court in equity will consider that the complainant had a right to rely on the statements of the defendant, and that in such a case no laches could be attributed to him. [*Id.

3. SAME.
In a case upon the facts above stated the defendant's denials of the allegations of complainant's bill are insufficient to defeat the equities of the bill or to avoid the complainant's *prima facie* case. To work such result it is necessary for the defendant to fully disclose to the court such facts as will advise it of the non-identity of the invention assigned with the later invention, against which the complainant's bill is directed. [*Id.

BAR TO SUIT.

(See Record of a Court, 1.)

A DECREE ABSOLUTE IN TERMS—EFFECT ON LATER LITIGATION.
A decree absolute in its terms is an adjudication of the merits of the controversy, and constitutes a bar to any further litigation of the same subject between the parties.
[*Lyon v. The Perin and Gaff Manufacturing Company, 963.

BILL IN EQUITY.

(See Assignments; Interference, 4.)

BURDEN OF PROOF.

(See Damages and Profits, 10.)

CHANGE OF MATERIAL.

(See Infringement, 4.)

CLAIMS.

(See Amendments, 6; Technical Terms, 2.)

1. ADJUNCTIVE DEVICES.
In a given specific invention which embraces adjunctive devices the adjunctive devices referred to in all the claims must be the same and bear the same relation to the different elements.
[*Ex parte* Stanbridge, 1345.

2. VAGUE OR INDEFINITE LANGUAGE.
Applicant claims, broadly, "automatically-operating mechanism to impart alternate fast and slow movements to the driving-shaft" in his needle-grooving machine, but concedes that the principle involved is old and that this varying movement or motion has been accomplished by an infinite variety of means to an infinite variety of kinds and classes of machinery; but he insists that he is the first in this particular kind of machinery to apply means for varying the movement. *Held* that applicant has only invented improvements upon mechanism already used to accomplish the same result, and that he must limit his claims to the specific construction by which he obtains this variableness of movement. The courts would undoubtedly construe his patent to cover his specific construction, and to permit such vague and indefinite language in claims would result in misleading the public or in deterring others from entering this particular field of invention, and thus by a species of intimidation applicant would secure a protection to which he is not entitled.
[*Ex parte* Miller, 1346.

3. COMBINATION AS DISTINGUISHED FROM ADAPTATION.
Claims for combinations distinguished from claims covering elements having a specific construction and arranged in such peculiar relation as to be adapted to use with each other. While it cannot be doubted that it is the better practice in all cases of novel combination to express the claim in combination form, it sometimes occurs that an invention is of such peculiar character as to render such a claim unimportant.
[*Ex parte* Weeks, 1565.

COMBINATIONS.

(See Claims, 3; Construction of Claims, 1; Design Patents, 4.)

COMMISSIONER OF PATENTS.

(See Amendments, 1.)

COMPOSITION OF MATTER.

(See Abandonment; Construction of Claims, 3; Infringement, 2; Invention, 3.)

CONSTRUCTION OF CLAIMS.

1. CLAIMS—CERTAINTY OF TERMS OF.
Where a claim covered the combination of one element named with another element named, "or other part," these last words would mean some other equivalent part and the claim would be sufficiently certain.
[*Babcock & Wilcox Company v. Pioneer Iron Works, 756.

2. CONSTRUCTION OF CLAIM—PROCESS—INFRINGEMENT.
A claim in the following words, namely: "In a concrete pavement, the use of crushed and pulverized rock, when the same is heated and saturated with dead-oil, crude petroleum, or the residuum of petroleum, and mixed with natural asphaltum, Cuban, Trinidad, or California, previously dissolved to a pitch by crude petroleum or the residuum of petroleum, substantially as described, and for the purpose set forth," construed as for a process, and also as for a process in which the previous saturation of the rock with dead-oil, crude petroleum, or the residuum of petroleum is one of the essential steps. *Held* that the omission of such step averts the charge of infringement.
[*Van Camp v. The Maryland Pavement Company, 894.

3. PROCESS AND PRODUCT.
Under a proper construction of the language such a claim as the foregoing cannot be held to cover both a process and also a composition of matter. [*Id.

4. ERROR IN CLAIM FATAL.
It is fatal to a patent that a patentee claims as essential a step which is unnecessary. [*Id.

5. INFRINGEMENT—WHEN NOT AVOIDED.
A claim is not avoided because the specification does not describe details of construction in elements of the claims well known in the particular art and employed only by the defendant.
[*Thompson *et al.* v. Gildersleeve, 886.

6. COMBINATION CLAIM—WHAT IT INCLUDES.
A combination claim includes whatever is made a part of the combination by the words of the claim, or by necessary inference is a material part in the construction of the patent.
[*Id.

7. SAME.
Where the elements of a combination in a claim co-operate in a result, these parts constitute the combination claimed, and all the other parts of the machine which make these parts operate in this way to produce the result required are for that purpose equivalents of the parts of any other machine, (however different they may be in themselves,) which also make these parts operate in the same way to produce the same result.
[*Id.

CONSTRUCTION OF RULES.

(See Division of Application, 1.)

CONSTRUCTION OF SPECIFICATIONS AND PATENTS.

(See Infringement; Invention; Particular Patents; Patentability; Process and Product; Reissues, 1, 2, 3, 5, 6, 7, 8.)

1. THE INVENTION OF THE BELL PATENT OF MARCH 7, 1876, CONSIDERED.
The sound of articulate speech is one of the "vocal or other sounds" referred to in said patent. The art or process described in said patent consists in gradually changing the intensity of a continuous electric current so as to make it correspond exactly to the changes in the density of the air caused by the sound of the voice, and devising a way in which these changes of density could be made and speech actually transmitted put the art in a condition for practical use. In doing this both discovery and invention, in the popular sense of these terms, were involved—discovery in finding the art and invention in devising the means to make it useful. A patent for the art does not necessarily involve a patent for the particular means for doing it, and the mention of means in the specification is only necessary to show that the art can be used to advantage.
[*Dolbear *et al.* v. American Bell Telephone Company, 877.

2. THE FIFTH CLAIM OF THE BELL PATENT OF MARCH 7, 1876, CONSIDERED AND DEFINED.
What Bell claims is the art of creating changes of intensity in a continuous current of electricity exactly corresponding to the changes of density in the air caused by the vibrations which accompany vocal or other sounds, and of using that electrical condition thus created for sending and receiving articulate speech telegraphically. [*Id.

3. CLAIM NOT INCONSISTENT WITH DECISION IN O'REILLY v. MORSE. (15 How., 62.)
This claim is not in opposition to the decision in *O'Reilly v. Morse*, but is sustained by it, as this claim is not for the use of a current of electricity in its natural state as it comes from the battery, but for putting a continuous current in a closed circuit into a certain specific condition, suited to the transmission of vocal and other sounds and using it in that condition for that purpose. [*Id.

4. SAME.
It may be that electricity cannot be used at all for the transmission of speech except in the way Bell has discovered, and that therefore, practically, his patent gives him its exclusive use for that purpose; but that does not make his claim one for the use of electricity distinct from the particular process with which it is connected in his patent. [*Id.

5. CONSTRUCTION OF PATENTS.
While a patent is to be liberally construed, so as to sustain it as a grant of the invention actually made and actually claimed, it can never by judicial construction be made to cover an invention nowhere claimed in it, and which the public has had no fair notice that the patentee intended to claim.
[*Van Camp v. The Maryland Pavement Company, 884.

CONSTRUCTION OF STATUTES.

(See Application by Executor or Administrator; Construction of Specifications and Patents, 1, 3; Design Patents, 3, 7; Jurisdiction, 3; Jurisdiction of United States Courts, 1; Limitation of United States Patents by Foreign Patents Previously Granted; Patentability, 1; Reissues, 8; Testimony, 2, 3.)

1. STATUTES—HOW CONSTRUED.
If there is no ambiguity in the statute, it is the duty of the court to give effect to its obvious meaning, without entering into any inquiry as to the supposed intention of Congress, notwithstanding the statute may be thought to make an unreasonable and harsh innovation.
[*Edison Electric Light Company v. United States Electric Lighting Company, 1456.

2. SAME.
Where the meaning of the Revised Statutes is plain, the court cannot look into the source of the revision to ascertain whether errors have or have not been committed by the reviser. [*Id.

CONTINUOUS APPLICATION.

(See Application by Executor or Administrator.)

CROSS-REFERENCES.

(See Reservation for Subsequent Patents.)

DAMAGES AND PROFITS.

(See Jurisdiction; Master's Report, 2; Settlement of Suit.)

1. MEASURE OF DAMAGES.
When the invention relates to a new composition of matter and the infringing article is made of the patented material, and this alone, the measure of the patentee's damages may be the entire profit which he would have made.
[*Welling v. La Bau, 117.

2. SAME.
This rule is not changed where the infringing articles are of a poorer quality than the complainant's if they are so nearly alike in appearance as to deceive not only buyers but experts in the trade. [*Id.

3. INTEREST IN COLLECTIONS NOT INVOLVING NECESSARILY INTEREST IN PATENT.
An interest in the net proceeds of collections for infringements of a patent does not necessarily involve an interest in the patent itself.
[*Tilghman v. Proctor *et al.*, 928.

4. RULES FOR SETTLING GAINS AND PROFITS.
The infringer is liable for actual, not for possible, gains; for the fruits of the advantage which he derived from the use of the invention over that which he would have had in using other means then open to the public, and adequate to enable him to obtain an equally beneficial result. [*Id.

5. SAME.
If there was no advantage in the use of the plaintiff's invention, there can be no decree for profits, and the plaintiff's only remedy is by action at law for damages. [*Id.

6. SAME.
If the defendants gained an advantage by using the plaintiff's invention, that advantage is the measure of the profits to be accounted for, even if from other causes the business in which that invention was employed by the defendants did not result in profit. [*Id.

7. SAME.
A court of equity will itself administer full relief by awarding as an equivalent or a substitute for legal damages a compensation computed and measured by the same rule that courts of equity apply in the case of a trustee who has wrongfully used the trust property to his own advantage. [*Id.

8. SAME.
A court in equity will require an infringer to account for the gains and profits which he has made from the use of a patented invention instead of limiting the recovery to the amount of royalties paid to the patentee by third persons. [*Id.

9. SAME.
Where the patent in suit had been adjudged invalid by this Court in a suit against another defendant, and subsequently in this suit the Court had adjudged the patent valid, the defendants must account for infringements committed after the date of the first adjudication that such patent was invalid.
[*Id.

10. SAME.
The plaintiff has the burden of proving the amount of profits the defendants have made by the use of his invention.
[*Id.

11. SAME.
As to the comparative expense of the old process, the cost at which the defendants used it, if at all, is not conclusive evidence that the old process could not have been used at a less cost.
[*Id.

12. INTEREST ON AMOUNT SETTLED—DATE OF SAME.
Interest should be allowed upon the amount found due the plaintiff by this Court from the date when the master's report was submitted to the court below. [*Id.

DECREE.

(See Bar to Suit.)

DEFENSE.

1. DIFFERENCE OF PURPOSE—WHEN NO DEFENSE IN INFRINGEMENT.
It is no defense in a suit for infringement that the defendant's machine was used for forming staple-seams in paper, and not in leather, both machines operating in the same way.
[*Thompson *et al.* v. Gildersleeve, 886.

2. PRACTICE—LACK OF INVENTION.
The defense of no patentable invention can be made without setting it up in an answer.
[*Hendy *v.* The Golden State and Miners' Iron Works *et al.*, 1117.

3. ON PLEA.
The defendant pleaded that he should not be called upon to answer, because by reason of the expiration of a foreign patent for the same invention the patent in suit had expired, and the complainant had a plain, adequate, and complete remedy at law, and the court should not take cognizance in equity of the suit. The complainant contended that such a defense could not be raised by plea, and if it could, that the plea was insufficient both in matters of form and substance to present such a defense.
[*Edison Electric Light Company *v.* United States Electric Lighting Company, 1456.

DELAY IN APPLYING FOR REISSUE.

(See Reissues, 2, 5.)

DELAY IN THE PROSECUTION OF APPLICATION FOR PATENT.

(See Diligence.)

DESCRIPTION.

(Claims; Design Patents, 1; Technical Terms, 2, 3.)

DESIGN PATENTS.

1. EMPLOYMENT OF THE WORDS "AS SHOWN AND DESCRIBED" IN CLAIMS OF DESIGN PATENTS.
It is well understood that, while the courts, when construing the validity, scope, and extent of the claims in patents, will regard the words "as shown and described" as ever present, and when absent will not construe patents to embrace more than is shown and described, it is the policy of the Office while it has control over applications to insist that the form and phraseology adopted and employed by applicants should not be misleading nor unintelligible to the common people who seek to deal with patent property. It has therefore been customary to require that the words "as shown and described" shall be employed in the claims of design patents, in order that the patents may be limited to the subject-matter shown and described. The introduction of such words operates as a guide-post to inform all persons that the patent is limited to the precise invention shown and described, and that there is no hidden mystery nor secret trap by which those who attempt to enter the same field of invention or to use other articles may be arrested in their efforts or mulcted in damages.
Ex parte Gérard, 1235.

2. EMBRACING MORE THAN ONE INVENTION.
A design application will not be permitted to embrace more than one subject of invention. The same principles in this particular which control in mechanical applications must obtain in design applications. A distinct and separate invention relating to the form or configuration cannot be lawfully included in a patent embracing a distinct and separate invention as to surface ornamentation—as, for instance, an alto-rilievo cannot be joined with an ornamentation or picture to be worked into a woolen fabric; but when the shape and the ornamentation are parts of the same article of manufacture, so that both unite in producing the same result, then they are not distinct and separate within the purview of the rule. [Id.

3. WHAT ELEMENTS OR FEATURES OF DESIGN ARE COVERED AND PROTECTED BY A DESIGN PATENT.
Under the statute the design must be a *finished* and *completed* thing—must be one entire and integral thing. It cannot consist of several integral different designs aggregated, so as to protect the several individual parts, nor so that these parts may be separately applied to other and different articles or parts of articles of manufacture. [Id.

4. DOCTRINES OF COMBINATIONS AND GENUS AND SPECIES NOT APPLICABLE IN DESIGNS.
The doctrines of combinations and elements of combinations and of genus and species obtaining in mechanical inventions cannot be applied to designs. In a mechanical combination, when one element is withdrawn that combination ceases; but in a design a subordinate and unimportant feature may be withdrawn and yet the design as a whole remain, and to simulate the predominant features would infringe the whole. [Id.

5. TEST OF INFRINGEMENT.
The test of infringement is the "identity of appearance, determined by the eye of the ordinary observer." (*Gorham Company v. White.*) As the subject of identity of the design is addressed to the eye of the ordinary observer—the public—so the questions of the extent and character of claims in patents for distinctive and severable parts must be determined largely by the skill and judgment of the experts of the Office. [Id.

6. OBJECTIONS RELATING TO NON-SEGREGABILITY—TO WHOM APPEALABLE.
Objections to claims for non-segregable parts relate to the merits rather than to form, and upon rejection the appeal should go to the Examiners-in-Chief. [Id.

7. SUBJECTS FOR DESIGN ALSO SUBJECTS FOR MECHANICAL PATENTS.
A new and original design under the statutes may also be the subject of a mechanical patent. (*Ex parte Schulze-Berge*, 42 O. G., 298.) [Id.

8. GENUS AND SPECIES.
The relation of genus and species does not exist in designs. The question involved in designs is one of identity.
Ex parte Gérard, 1240.

9. LIMITED TO A SINGLE INVENTION.
A patent for a design must be limited to a single invention; but such patent may cover any variation or modification, provided the distinct and predominant features so far remain as to preserve the identity of the original completed design. [Id.

DILIGENCE.

(See Amendments, 6.)

1. CLAIMS CONFLICTING WITH PENDING APPLICATIONS.
Applicants present broad and generic claims and claims for specific constructions. The former have been rejected for lack of novelty, and the latter found to conflict with claims in other pending applications. They insist that they have two years in which to appeal from the rejection, and by refusing to act successfully tie up other applications and prevent the issue of patents, or place the Office in the position of issuing patents which may hereafter be adjudged to interfere with an application pending at the time the patents were granted.
Held that if applicants refuse to avail themselves for an unreasonable time of their right of appeal, or are unreasonably dilatory in seeking the protection which the rules offer them, for the purpose of delaying the issue of patents to other parties for their inventions which have been found patentable, the Commissioner would not be justified in permitting such dilatory and unjust action of applicants to work hardship to other applicants who are entitled to the specific constructions, tions, but will issue the patents.
Ex parte Lombard *et al.*, 1347.

2. SAME.
In such cases the applicants should be notified that in order to secure an interference they must act with reasonable promptness; but the Office and not the applicants must be the judge of what constitutes reasonable promptness. [Id.

DISCLOSURE OF INVENTION.

(See Assignments, 3.)

DIVISION OF APPLICATION.

1. REFUSAL OF AMENDMENT BY EXAMINER WHICH DOES NOT CURE DEFECT IN ORIGINAL SPECIFICATION.
When division of an application has been required and an amendment is presented which does not relieve the application from the objection raised, but simply reduces the number of the inventions, the examiner should refuse to admit it.
Ex parte Maxim, 506.

2. SAME.
The only effect of such amendment, when admitted, is to narrow or limit the right of applicant in making election of the invention he desires to prosecute in his pending application. [Id.

3. FINAL ELECTION.
The objection that applicant has elected and cannot be permitted to further amend his case raises the question of what constitutes an election under these circumstances. *Held* that such action does not put the applicant in the status of having made a final election from which he may not be allowed to recede, and applicant cannot be considered to have made a final election until he shall have complied with the requirement as to division and the Office approves and accepts his action. [Id.

ENLARGEMENT OF CLAIMS.

(See Particular Patents, 2, 3, 16; Reissues, 1, 3, 5.)

EQUIVALENTS.

(See Infringement, 4.)

ESTOPPEL.

(See Joint Application.)

EVIDENCE.

(See Abandonment; Official Documents; Plea, 5, 6, 7; Reissues, 6; Testimony.)

1. PRACTICE—WHAT IS INCLUDED IN THE RECORD.
A stipulation in the suit included the evidence taken in another suit, and a certified copy of Fisher's original patent appearing in the record under the certificate of the clerk of the circuit court that it was a part of the record and of the proceedings in the cause, although there was no separate memorandum in the record of introduction of the original patent in evidence, this Court assumes the same to be properly in the case.
[*Hoskin *et al. v.* Fisher *et al.*, 509.

2. NO PRESUMPTION OF LAW AS TO THE SIMILARITY OF TWO REISSUES, ONE OF WHICH IS NOT IN EVIDENCE.
The reissue in suit being a second reissue, and the first reissue not being found in the record, no presumption of law arises that the first and the second reissues were for the same invention with similar second and third claims. To have the advantage of the first reissue it should have been put in evidence. [*Id.

3. THE COMPARISON CONFINED TO THE REISSUE IN SUIT AND THE ORIGINAL PATENT.
The original patent and the second reissue being properly before the Court, a comparison of the two may be made to determine the validity of the second reissue. [*Id.

EVIDENCE OF INVENTION.

1. UTILITY.
The Office is bound to raise the question of utility of an alleged invention in cases where natural laws and established principles are disregarded, for the reason that the law does not authorise the grant of Letters Patent except for novel and useful inventions. In such cases, even if novelty were admitted, a patent would be withheld until applicant should demonstrate the operativeness of his device. *Ex parte* statements or theoretical arguments are not sufficient; applicant must prove by practical demonstration his assertions.
[*Ex parte* de Bausset, 1583.

2. SAME.
The patent system was not designed to protect the chimerical schemes of visionaries or closet theorists. Invention consists in more than the work of the imagination. To conceive of a scheme of vast dimensions is the work of a dreamer; to make the mathematical computations requires the ordinary knowledge of the student; to face the difficulties of construction and devise means to overcome them is the true work of the inventor. [Id.

(See Limitation of United States Patents by Foreign Patents Previously Granted.)

SECTION 4887 REVISED STATUTES CONSTRUED.
It is not material whether the foreign patent is granted to the inventor who made the application in this country or to some other person to whom he has caused the invention to be patented, nor that the inventor who makes the application here is one of our citizens.
[*Edison Electric Light Company *v.* United States Electric Lighting Company, 1456.

FOREIGN USE.

(See Preliminary Statement.)

FORMER DECISIONS AFFIRMED.

(See Particular Patents, 30; Reissues, 6.)

FORMER DECISIONS CONSTRUED.

(See Reservation for Subsequent Patents, 1, 2, 3.)

FRAUD.

(See Particular Patents, 18; Technical Terms, 1.)

HUSBAND AND WIFE.

(See Testimony.)

IDENTITY OF INVENTION.

(See Assignments, 3; Design Patents, 8, 9.)

INFRINGEMENT.

(See Construction of Claims, 2; Damages and Profits, 3; Design Patents, 5; Injunction; Particular Patents, 1, 2, 3, 4, 15, 17, 18, 27, 28, 30.)

1. HAVING CLAIMED A PART OR STEP ESSENTIAL IT CANNOT BE TREATED AS NON-ESSENTIAL.
When a patentee emphasizes in his specification and makes a part of the claim allowed by the Patent Office a particular step in a particular process, which step in the process the defendant does not use, it is not allowable for him to disregard that step or to contend that it is not essential.
[*Van Camp *v.* The Maryland Pavement Company, 894.

2. CONSTRUCTION OF CLAIM—INFRINGEMENT.
Even in a good claim for a composition of matter which is not described otherwise than by the process of making it nothing can be in infringement which is not made by the process described. [*Id.

3. INFRINGEMENT—WHEN NOT AVOIDED.
Where the defendant's anvil was made in separate parts, while the complainant's was a single piece, if the operation and results of each were the same, one construction was the equivalent of the other.
[*Thompson *et al. v.* Gildersleeve, 886.

4. EQUIVALENT—WHAT IS NOT MECHANICALLY.
The claim of the patent embracing a longitudinal groove, the employment instead of pieces of wax is not a mechanical equivalent.
[*Förncrook *v.* Root, 984.

5. INFRINGEMENT—WHEN NONE.
The cylinder of the claim being described as having chambers or depressions, and the defendants' cylinder being smooth throughout, there was no infringement in this particular.
[*Hendy *v.* The Golden State and Miners' Iron Works *et al.*, 1117.

INJUNCTION.

1. RIGHT TO PRELIMINARY INJUNCTION—PRESUMPTION OF VALIDITY.
To entitle a complainant to a preliminary injunction, restraining the infringement of Letters Patent, there must be a special presumption in favor of the validity of the patents, arising from an adjudication in a Federal court, acquiescence by the public, or a successful interference in the Patent Office.
[*Edward Barr Company (Limited) *v.* New York and New Haven Automatic Sprinkler Company, 892.

2. SAME—FIRE-EXTINGUISHER.
A preliminary injunction, restraining the infringement of Letters Patents No. 307,456, November 4, 1884, and No. 357,987, February 15, 1887, for automatic fire-extinguisher, denied, as nothing appeared in the motion papers showing such a former adjudication, public acquiescence, or successful interference in the Patent Office, between the parties or their privies. [*Id.

3. SAME—PRESUMPTION—PARTIES TO—RESTRICTION OF—INTERFERENCE.
A presumption of validity arising from a successful interference in the Patent Office only applies against the parties to the interference and their privies. It does not extend to litigants who do not make the infringing article under a grant from the interferer. [*Id.

4. INJUNCTION AGAINST DEFENDANT NOT INCLUDED IN TERMS OF SETTLEMENT.
An injunction, however, may be granted against the defendant who was not included in terms by the writing of the settlement.
[*Babcock & Wilcox Company v. Pioneer Iron Works, 756.

INTEREST ON ROYALTY.

(See Damages and Profits, 12.)

INTERFERENCE.

(See Diligence, 2; Preliminary Statement, 1, 2.)

1. JOINT PATENTEES.
One of two joint patentees files a sole application for the invention; an interference is declared between the patent of the joint patentees and the application of the sole applicant, and motion is made to dissolve, based on the ground that the Office has no power to declare the interference and cannot issue a patent to the sole applicant under these circumstances.
Motion overruled, and *Held* that when patent issues to joint inventors as such neither is *the* inventor, but the invention is made by an entity composed of both parties, and that joint patentees are not the same as the sole applicant claiming the invention.
[Kohler v. Kohler and Chambers, 247.

2. INTERFERENCE DECLARED.
It is true that in an interference declared under such circumstances neither party could antedate the other as to the time the invention was conceived and embodied; but the question of priority would necessarily resolve itself into a determination as to whether the entity composed of the joint patentees had ever made the invention at all. If they never made the invention, then no date could be established for them, and the sole applicant would be entitled to the award as the real and true inventor. The interference will develop the truth and the facts, and if it shall appear that the invention was joint, patent will be denied the sole applicant. If, on the other hand, it shall appear that the joint application was prepared and executed through misapprehension or mistake, then the interference should be determined in favor of the sole applicant. [Id.

3. PUBLIC USE—BURDEN OF PROOF.
Two applications of La Dow are involved in this interference, in one of which he is the junior and in the other the senoir applicant. In his preliminary statement he sets up public sale of the invention, which, if established, would bar all parties. Clark moves that La Dow be required to file drawings and descriptions of the invention alleged to have been sold and furnish other information. *Held* that in view of the averments of public use it would be unjust and unnecessary to put Clark to the expense of taking his evidence first, so long as La Dow was attempting to destroy the necessity of an interference, and ordered that La Dow be required to proceed first and take such evidence as he desires which shall establish the facts set forth in his preliminary statement, and also in support of the question of priority. Clark may then follow with evidence rebutting that offered by La Dow.
[Clark v. La Dow, 248.

4. FILING OF BILL IN EQUITY IN CIRCUIT COURT BY DEFEATED PARTY WILL NOT STAY THE ISSUE OF PATENT TO SUCCESSFUL PARTY IN INTERFERENCE.
The filing of a bill in equity in the circuit court of the United States by the defeated party to an interference will not operate to stay the issue of patent to the successful contestant, nor will it justify the Commissioner of Patents in delaying or withholding it until such proceeding in equity is terminated.
[Wells v. Boyle, 753.

INVALIDITY OF PATENTS.

(See Construction of Claims, 4.)

INVENTION.

(See Construction of Specifications and Patents, 1, 2, 3, 4; Evidence of Invention; Patentability.)

1. PATENTABLE INVENTION—WHAT IS NOT.
In a prior patent describing a U-shaped trough for the purpose of connecting outer rails, leaving the central rails to be secured by means of a V-shaped recess in the bed of the plate at the wide end of the trough, there was no invention in dividing the trough into two, so as to connect the central rails on each side by means of a separate U-shaped trough with the outer rail exterior to them. [*Weir v. Morden *et al.*, 753.

2. PATENTABLE INVENTION—WHAT IS NOT.
Where there was merely a good selection from among known joints and involved good workmanship and apparently nothing more, there was no patentable invention.
[*Babcock & Wilcox Company v. Pioneer Iron Works, 756.

3. COMPOSITION OF MATTER—OLD ELEMENTS—INVENTION.
When a mechanically-combined material composed of particular ingredients is old, a person who has merely altered the proportions of ingredients or the process of combining them has not discovered a new composition of matter in the sense of the patent law. To be a new composition of matter the product must have some distinctly new property or be applicable to some new use.
[*Van Camp v. The Maryland Pavement Company, 884.

4. AGGREGATION—NOT PATENTABLE.
Where the same combination was employed in square-cornered safes it was simply an unpatentable aggregation to employ it to round-cornered safes.
[*Mosler Safe and Lock Company v. Mosler, Bahmann & Company, 1115.

5. PATENTABLE INVENTION—WHAT IS NOT.
Merely putting rollers under an article to make it movable when without the rollers it would not be movable does not involve patentable invention.
[*Hendy v. The Golden State and Miners' Iron Works *et al.*, 1117.

6. AGGREGATION—NOT COMBINATION.
There is no patentable combination between rollers which make the support movable and a feeding-cylinder mounted on such support. [*Id.

INVENTION CLAIMED BUT NOT DESCRIBED.

(See Construction of Claims, 5.)

INVENTION DESCRIBED BUT NOT CLAIMED.

(See Reissues, 3.)

JOINT APPLICATION.

(See Interference, 1, 2.)

IS THE SOLE INVENTOR ESTOPPED BY HIS FORMER OATH?
An applicant is not estopped by reason of his oath filed with a joint application from asserting his rights as sole inventor; nor should he be denied a patent on account of having made an error or mistake in the matter of joint inventorship.
[Kohler v. Kohler and Chambers, 247.

JOINT INVENTORS.

(See Assignees; Interference, 2.)

JURISDICTION.

(See Plea.)

1. JURISDICTION—PRACTICE.
Where in a suit at law in a State court for the recovery of license-fees under a written contract the plaintiff recovered damages, and the defendant by writ of error brought the suit into this Court as involving a Federal question, and the defendant in error moved in this Court to dismiss the writ of error for want of jurisdiction, and also moved to affirm the judgment of the State court, *Held* that the motion to dismiss must be denied because the validity of a second release subsequent to that under which the license was given had been set up in defense below and that presented a Federal question. *Held* that the motion to affirm the judgment of the State court must be granted because the same was clearly right.
[*Dale Tile Manufacturing Company (Limited) v. Hyatt, 249.

2. JURISDICTION—PRACTICE.
In an action of assumpsit in a State court for the recovery of license-fees under a written contract the plaintiff recovered damages and the defendant brought the suit into this Court as involving a Federal question, and the defendant in error moved in this Court to dismiss the writ of error for want of jurisdiction. *Held* that as the question at issue in the State court was not of priority of invention or of the validity or construction of any patent, but simply whether the reels made and sold were the same, or substantially the same, as mentioned in the contract, no Federal question was presented. *Held*, in allowing a writ of error to this Court, the certificate of the chief justice of a State court that a Federal question arose is not conclusive upon this Court and cannot supply the want of evidence of such fact in the record. [*Felix v. Scharnweber, 251.

3. JURISDICTION—ACT OF MARCH 3, 1887.
The $2,000 limitation placed upon the jurisdiction of the court under the act of March 3, 1887, does not apply to patent cases or to suits for the infringement of patents.
[*Miller Magee Company *et al.* v. Carpenter, 1113.

JURISDICTION OF UNITED STATES COURTS.

JURISDICTION WITHOUT REGARD TO AMOUNT.
In the suit at bar, which was for patent license-fees under a contract, where both the validity of the patent and infringement were put in issue and decided by the circuit court, there is no doubt that this was "a case touching patent rights" and came within the jurisdiction of this Court under section 689 Revised Statutes, without regard to the sum or value in dispute.
[*St. Paul Plow Works v. Starling, 1120.

LACHES.

(See Assignments, 2.)

LICENSE.

(See Jurisdiction, 1, 2; Jurisdiction of United States Courts.)

LIMITATION OF UNITED STATES PATENTS BY FOREIGN PATENTS PREVIOUSLY GRANTED.

(See Construction of Statutes, 1, 2; Defense, 3; Foreign Patents; Oath in Relation to Foreign Patents; Particular Patents, 20; Plea, 5, 6, 7.)

1. BELL'S PATENT OF JANUARY 30, 1877, NOT AFFECTED BY PRIOR ENGLISH PATENT.
The effect of section 4887 of the Revised Statutes is not to render invalid an American patent by an English patent of an earlier date for the same invention, but only to limit its term.
[*Dolbear *et al.* v. American Bell Telephone Company, 377.

2. STATUTE 4887 CONSTRUED.
A patent of the United States taken out by the inventor, a citizen of the United States, expires at the date of expiration of a foreign patent for the same invention previously taken out by the same inventor, or by his request, although the patent of the United States had been first applied for and the invention had been put in use in the United States before the foreign patent had been applied for.
[*Edison Electric Light Company v. United States Electric Lighting Company, 1456.

MASTER'S REPORT.

(See Damages and Profits.)

1. CONCLUSIVENESS.
The proceedings before a master have almost the same solemnity as a trial before a referee or a jury, and the familiar rule which precludes the court from setting aside a verdict which is not against the weight of evidence is to a great extent applicable. [*Welling v. La Bau, 117.

2. PRESUMPTIONS SUPPORTING.
In dealing with the exceptions to the master's report, his conclusions, depending upon the weighing of conflicting testimony, have every reasonable presumption in their favor, and are not to be modified or set aside unless there clearly appears to have been error or mistake on his part.
[*Tilghman v. Proctor *et al.*, 638.

MEASURE OF DAMAGES.

(See Damages and Profits.)

MECHANICAL SKILL.

(See Invention, 1, 2, 4, 5, 6.)

MISTAKE.

(See Reissues, 7, 8.)

MODEL.

(See Reissues, 6.)

NEW APPLICATION.

(See Withdrawal of Case from Issue.)

NEW MATTER.

(See Amendments, 3.)

OATH IN RELATION TO FOREIGN PATENTS.

1. PETITION AND OATH.
The petition failed to refer to or identify the specification, and the oath accompanying the application contained the statement that the invention had not been patented to the applicant, "nor with his knowledge or consent in any foreign country," the words "to others" being omitted and the word "foreign" inserted before *country*.
Held that the petition was defective, and must be amended to contain a reference to the specification for a full disclosure of the alleged invention.
[*Ex parte* Mason, 887.

2. OATH.
The oath filed by applicant is indefinite and may be construed to mean that the invention has not been patented to applicant in any country, or to himself in any foreign country, or with his knowledge or consent in any foreign country. [Id.

3. MATERIAL DEPARTURES FROM THE RULES NOT PERMITTED.
If the rules are violated or departed from in one material particular, the practice would soon become lax in other particulars. The several requirements of the rule with regard to the oath must be enforced. [Id.

OATH TO JOINT APPLICATION.

(See Joint Application.)

OFFICIAL DOCUMENTS.

PRESUMPTIONS ATTENDING FOREIGN OFFICIAL DOCUMENTS.
The tribunals of every nation take judicial notice of the public seals of foreign States, and the annexation of the seal will be presumed to have been made by a person having custody thereof and competent to do the act.
[*Edison Electric Light Company v. United States Electric Lighting Company, 1456.

OMISSION OF PARTS.

(See Construction of Claims, 2; Infringement, 1.)

OPERATIVENESS OF DEVICE.

(See Evidence of Invention.)

ORDER OF INSPECTION OF INVENTION IN SUIT BY ASSIGNEE.

(See Assignments.)

PARTICULAR PATENTS.

(See Construction of Specifications and Patents; Limitation of United States Patents by Foreign Patents Previously Granted.)

1. BABCOCK AND WILCOX—STEAM-GENERATORS.
Letters Patent No. 175,548, dated April 4, 1876, granted to Babcock and Wilcox, for an improvement in sectional steam-generators, adjudged invalid as to the first claim for lack of invention in the same.
[*Babcock & Wilcox Company v. Pioneer Iron Works, 756.

2. BAILEY—HYDRANTS.
Reissued Letters Patent No. 6,990, granted March 14, 1876, to Thomas R. Bailey, Jr., for an improvement in hydrants, adjudged invalid as to the first claim and not infringed as to the third claim thereof.
[*Flower *et al.* v. City of Detroit, 1349.

3. BELL—TELEGRAPHY—No. 174,465.
Letters Patent No. 174,465, granted to Alexander Graham Bell March 7, 1876, for improvements in telegraphy, adjudged valid as to the fifth claim thereof, and to have been infringed.
[*Dolbear *et al. v.* American Bell Telephone Company, 377.

4. BELL—ELECTRIC TELEGRAPHY—No. 186,787.
Letters Patent No. 186,787, granted to Alexander Graham Bell January 30, 1877, for improvements in electric telegraphy, adjudged valid as to the third, fifth, sixth, seventh, and eighth claims thereof, and to have been infringed. [*Id.

5. THE BELL PATENT OF MARCH 7, 1876, NOT LIMITED TO A MAGNETO-INSTRUMENT.
The Bell patent is not confined to a magneto-instrument and such modes of creating electrical undulations as could be produced by that form of apparatus. [*Id.

6. THE FIFTH CLAIM OF SAID PATENT RESTATED.
The method of transmitting vocal or other sounds telegraphically, as herein described, by causing electrical undulations similar in form to the vibrations of the air accompanying the said vocal or other sounds, substantially as set forth. The apparatus for transmitting vocal or other sounds telegraphically, as herein described, by causing electrical undulations, substantially as set forth. [*Id.

7. THE SAME EXPLAINED.
The method, as herein described, includes both the magneto method and the variable-resistance method. The current must be kept closed to be used successfully; but this does not necessarily imply that it must be so produced or so operated upon as to be incapable of being closed. There is nothing in the patent which requires it to be operated by instruments which are incapable of making the break. The patent is both for the magneto and variable-resistance methods and for the particular magneto apparatus which is described, or its equivalent. There is no patent for any variable-resistance apparatus. The claim upon this broad construction is not "a claim for speech transmission by transmitting it—or, in other words, for all such doing of a thing as is provable by doing it." No one before Bell knew how to put electricity in a certain condition for successful use in speech transmission. [*Id.

8. NO ANTICIPATION OF THIS CLAIM BY REIS.
Bell's patent is not anticipated by the descriptions of the Reis telephone, which operated by a different method, using an intermittent or make-and-break current. [*Id.

9. NO ANTICIPATION BY VAN DER WEYDE.
Van der Weyde copied Reis, and it was not until after Bell's success that he found out how to use a Reis instrument so as to make it transmit speech. [*Id.

10. NO ANTICIPATION BY MCDONOUGH.
McDonough was anticipated by Reis, and in his application for a patent made a circuit-breaker so adjusted as to break the connection by the vibrations of the membrane one of the elements of his invention. [*Id.

11. NO ANTICIPATION BY VARLEY.
Varley's patents describe a Morse key, or something equivalent, and there is implied an operation on the principle of the electric telegraph—viz., by making and breaking the circuit. [*Id.

12. NO ANTICIPATION BY DRAWBAUGH.
Considering the history of Drawbaugh's inventions as described in evidence with perfected apparatus prior to Bell's invention, and the conduct of Drawbaugh after Bell's telephone had been patented and had become notorious, and the fact that Drawbaugh brought forward and patented other inventions after Bell's telephone had become universally talked about, and did not apply for a patent on his telephone until July, 1880, with other facts detailed at length, the Court comes to this conclusion, viz: "We do not doubt that Drawbaugh may have conceived the idea that speech could be transmitted to a distance by means of electricity, and that he was experimenting upon that subject; but to hold that he had discovered the art of doing it before Bell did would be to construe testimony without regard to the ordinary laws that govern human conduct." [*Id.

13. FRAUD IN PROCURING THE BELL PATENT OF MARCH 7, 1876.
The Court examine the testimony in respect to the charges of fraud in procuring said patent, and conclude that the charges had no foundation in fact. [*Id.

14. THE FIFTH CLAIM OF SAID PATENT CONSTRUED.
The fifth claim of this patent is not for the magnet, but for the telephone of which it forms a part. [*Id.

15. BENJAMIN—WHEELBARROWS.
Letters Patent No. 349,681, granted to William Benjamin September 28, 1886, for an improvement in metal wheelbarrows, adjudged not infringed by a construction like that described in Patent No. 326,945, granted to Joseph Annin December 29, 1885 for metal wheelbarrows.
[*Blaum *v.* National Barrow and Truck Company, 1587.

16. CORNELL—BUNG-BUSHING.
Reissued Letters Patent No. 8,739, granted June 17, 1879, to Lacy and Cornell, for bushes for bungs, adjudged invalid, as for an invention different from that of the original patent.
[*Cornell *v.* Weidner, 955.

17. COWELL—SASH-BALANCES.
The second claim of Patent No. 126,061, granted to John J. Cowell April 23, 1872, for an improvement in sash-balances, adjudged to be valid, and to have been infringed by a construction such as is described in Patent No. 185,260, granted to John Vetterlein, December 12, 1876, for a sash-pulley case.
[*Palmer *v.* Johnston, 756.

18. CRAWFORD—STEAM-GENERATORS.
Letters Patent No. 90,506, dated May 25, 1869, granted to Benjamin Crawford, for an improvement in steam-generators, adjudged valid as to the first, second, third, and fifth claims, and to have been infringed.
[*Babcock & Wilcox Company *v.* Pioneer Iron Works, 756.

19. CUSENBARY AND MARS—ORE-STAMP FEEDERS.
Letters Patent No. 140,250, granted June 24, 1873, to Cusenbary and Mars, for an improvement in ore-stamp feeders, adjudged invalid as to the first claim for lack of patentable invention.
[*Hendy *v.* The Golden State and Miners' Iron Works *et al.*, 1117.

20. EDISON—DYNAMO-ELECTRIC MACHINES.
Letters Patent No. 363,140, granted August 22, 1882, to Thomas A. Edison, for improvements in dynamo-electric machines, expired with the expiration of the Austro-Hungarian patent for the same invention.
[*Edison Electric Light Company *v.* United States Electric Lighting Company, 1456.

21. FISHER—HYDRAULIC-MINING APPARATUS.
Reissued Letters Patent No. 8,876, granted to Frank H. Fisher, September 2, 1879, for an improvement in hydraulic-mining apparatus, adjudged to be invalid.
[*Hoskin *et al. v.* Fisher *et al.*, 309.

22. FORNCROOK—SECTIONAL HONEY-FRAMES.
Letters Patent No. 243,674, granted to James Forncrook June 28, 1881, for an improvement in sectional honey-frames, adjudged to be invalid for lack of patentable novelty.
[*Forncrook *v.* Root, 944.

23. LITTLE—TIME-LOCKS.
Reissued Letters Patent No. 8,550, to Samuel A. Little, for improvements in time-locks, by which the multiple bolt-work of a safe or vault door could be automatically both dogged or locked and unlocked at predetermined times, the dogging and releasing being caused by the operation of the time mechanism, and the time for locking or unlocking being capable of alteration at the will of the operator, without disturbance of the clock-work, contained, *inter alia*, the following claim: "7. In a time-lock, the combination * * * of the time-movements and two adjustable devices, one for determining the time of locking and the other of unlocking." The original letters of the same patent contained, among others, the following claim: "2. The wheels B and C, with the depressions d and *f*, and the projections e and *g*, located relatively to each other as described, to increase and diminish the surface of a common cam, *i*, or depression *h*, by rotation on each other." * * * *Held*, that the seventh claim of the reissue was not an enlargement of the second claim of the original patent, because the latter should be construed broadly, and should not be confined to "a common cam," or to a device which was connected with the compound wheel in the same way in which the cam was connected, but was broad enough to include equivalent means of connection with the dog.
[*Yale Lock Manufacturing Company *et al. v.* New Haven Savings Bank, 115.

24. MOSLER—FIRE-PROOF SAFES—No. 281,640.
Letters Patent No. 281,640, granted July 17, 1883, to Moses Mosler, for improvement in fire-proof safes, adjudged invalid as to the first and second claims for lack of invention and as to the third claim for lack of novelty.
[*The Mosler Safe and Lock Company *v.* Mosler, Bahmann & Company, 1115.

25. SAME—BENDING ANGLE-IRONS.
Letters Patent No. 283,136, granted August 14, 1883, to Moses Mosler, for an improvement in bending angle-irons, adjudged invalid as being for a method of making the article described in the prior patent, No. 281,640. [*Id.

26. SAME.—FIRE-PROOF SAFES—No. 273,585.
Letters Patent No. 273,585, granted March 6, 1883, to Moses Mosler, for an improvement in fire-proof safes, adjudged invalid for lack of novelty, and because the claim covered simply an aggregation of elements. [*Id.

27. OTT—SOFA-BEDSTEADS—INFRINGEMENT.
The second claim of a patent issued to William Ott January 23, 1877, for an improvement in sofa-bedsteads, which is as follows: "In combination with the sections A and B, the folding rods F F, and head-boards D and E, supporting the latter when extended to sustain the bolster, substantially as set forth." *Held* not to be infringed by a device which makes the folding rods rest upon the end pieces of the lounge-frame, instead of upon head-boards, which are dispensed with.
[*Ott *v.* Barth, 114.

28. SHOREY—MACHINES FOR FORMING STAPLE-SEAMS IN LEATHER.
The third claim of Patent No. 186,340, dated February 25, 1873, granted to Samuel W. Shorey, for an improvement in machines for forming staple-seams in leather, adjudged valid and to have been infringed.
[*Thompson *et al. v.* Gildersleeve, 926.

29. WEIR—RAILROAD-FROGS.
Reissued Letters Patent No. 8,914, dated September 30, 1879, granted to Frederick C. Weir, for an improvement in railroad-frogs, adjudged to be invalid as to the second claim for lack of invention.
[*Weir *v.* Morden *et al.*, 753.

30. YALE—POST-OFFICE BOXES.
The first and second claims of Reissued Letters Patent No. 8,788, granted July 1, 1879, to the Yale Lock Manufacturing Company, declared invalid if construed broadly, and not to have been infringed if construed narrowly. The Court concurs in the views and in the result reached by the court below in this case as reported in 22 Blatchford, 294.
[*Yale Lock Manufacturing Company *v.* James, 881.

PATENTABILITY.

(See Construction of Specifications and Patents, 1, 2, 3, 4; Invention.)

PERFECTION IN OPERATION NOT ESSENTIAL TO THE VALIDITY OF A PATENT.
The law does not require that a discoverer or inventor, in order to get a patent for a process, must have succeeded in bringing his art to the highest degree of perfection. It is enough if he describes his method with sufficient clearness and precision to enable those skilled in the matter to understand what the process is, and also if he points out some practical way of putting it in operation.
[*Dolbear *et al. v.* American Bell Telephone Company, 377.

PATENT OFFICE.

(See Testimony, 2.)

PATENTS.

(See Interference, 4; Reissues, 7.)

PETITION.

(See Oath in Relation to Foreign Patents.)

PLEA.

(See Defense, 3.)

1. PLEA TO JURISDICTION PROPER.
A plea to the jurisdiction is proper both in suits at law and in equity.
[*Edison Electric Light Company *v.* United States Electric Lighting Company, 1456.

2. PLEA GOOD EVEN IF PARTLY OR WHOLLY NEGATIVE.
It is no objection that such a plea is partly a negative and partly an affirmative plea, or, indeed, negative wholly. [*Id.

3. PLEA—THE EFFECT OF.
The effect of the plea is to admit all the facts alleged in the bill except those specifically denied, and to meet the case made by the bill by alleging the new facts intended to show the expiration of the patent in suit. [*Id.

4. PLEA—WHEN SUFFICIENT.
A plea is sufficient which sets forth documents according to their tenor or legal effect, and avers the substantive facts relied upon. [*Id.

5. PLEA—PROOFS WHEN ISSUE IS TAKEN ON IT.
If issue were taken on the plea, it would only be necessary for defendant to produce a properly-authenticated copy of the foreign patent, and show the seal or signature affixed to it to be the act of an officer duly authorized to issue patents.
[*Id.

6. PLEA—THE EFFECT OF—HOW DETERMINED.
The effect and operation of the patent is to be determined as a question of law by the terms of the document, unless evidence of the foreign law is introduced to qualify or controvert the construction which would otherwise be placed upon the instrument. [*Id.

7. PLEA—WHAT ALLEGATION NECESSARY.
It is not necessary in pleading to allege that an instrument was executed by an agent, and that the agent was duly qualified thereto; but it is sufficient to allege the execution by the principal. [*Id.

PLEA IN BAR.

(See Plea; Record of a Court, 1.)

PRACTICE IN THE COURTS.

(See Abandonment; Bar to Suit; Damages and Profits; Defense; Injunction; Master's Report; Official Documents; Plea.)

PRACTICE IN THE PATENT OFFICE.

(See Amendments; Application by Executor or Administrator; Assignee; Claims; Design Patents, 1, 2, 3, 8, 9; Diligence; Division of Application; Evidence of Invention; Interference; Joint Application; Oath in Relation to Foreign Patents; Patentability; Preliminary Statement; Reissues, 7; Reservation for Subsequent Patents; Technical Terms, 2, 3; Testimony; Withdrawal of Case from Issue.)

PRACTICE IN THE SUPREME COURT OF THE UNITED STATES.

(See Evidence; Record of a Court, 1; Reissues, 4.)

PRELIMINARY STATEMENT.

(See Interference, 3.)

1. REDUCTION TO PRACTICE IN FOREIGN COUNTRY.
It is well settled that what an inventor did in a foreign country while a citizen of such country cannot in any way be used to antedate an invention made in the United States, and evidence tending to establish such facts would be wholly incompetent. Consequently a motion to amend a preliminary statement to set back the dates of invention and to allege disclosure and reduction to practice in such foreign country should have been denied. [Boulton *v.* Illingworth, 808.

2. SAME.
A party to an interference may have the right to prove what he did as an inventor, although living in a foreign country, for the purpose of showing his *knowledge*, but not for the purpose of establishing facts of invention as such. Such evidence is competent and admissible without the facts being set up in the preliminary statement. [Id.

PRESUMPTION.

(See Official Documents.)

PRESUMPTION OF VALIDITY OF PATENT.

(See Injunction, 1, 3.)

PRIORITY OF INVENTION.

(See Evidence of Invention, 2; Interference, 2, 3.)

PROCESS.

(See Construction of Claims, 2; Infringement, 1.)

PROCESS AND MEANS.

(See Construction of Specifications and Patents, 1.)

PROCESS AND PRODUCT.

(See Construction of Claims, 3.)

LATER PATENT FOR PROCESS INVALID WHEN ARTICLE IS PATENTED TO SAME PARTY IN EARLIER PATENT.
After a patent has been granted for an article described or made in a certain way the inventor cannot afterward obtain a valid patent on an independent application for the method or process of making the article in the way described in the earlier patent.
[*The Mosler Safe and Lock Company *v.* Mosler, Bahmann & Company, 1115.

PROCESS OR ART.

(See Construction of Specifications and Patents, 1, 2, 3, 4.)

PROSECUTION OF AN APPLICATION IN THE PATENT OFFICE.

(See Application by Executor or Administrator; Assignee; Division of Application.)

RECORD OF A COURT.

1. PLEA IN BAR.
The defendants pleaded in bar an adjudication and decree in their favor in a prior suit by the complainant against them for the same infringement, and put in evidence a copy of the decree. The complainant put in evidence a statement of the clerk of the court granting the decree, which statement was dated nearly two years after the decree was made, to the effect that no proof or testimony was filed in the suit by either party; that complainant did not appear nor was represented by counsel, and that the decree dismissing complainant's bill was granted on default of complainant.
[*Lyon *v.* The Perin and Gaff Manufacturing Company, 983.

2. RECORD IS THE EVIDENCE.
The court must look to the record, and not to the statement of the clerk of the court, made two years afterward. [Id.

RECORD OF LOWER COURT.

(See Evidence; Reissues, 4.)

RECORDS.

(See Evidence.)

REISSUES.

(See Jurisdiction, 1; Particular Patents, 2, 16, 23.)

1. REJECTION OF CLAIM—SUBSEQUENT APPLICATION AND REISSUE.
The third claim of the application for a second reissue of the Little patent for time-locks was for devices consisting of a "compound disk composed of two single disks of the same shape and size, placed face to face on a common axis." When these two disks or wheels were fastened together by a thumb-screw, they formed one wheel or disk. In said third claim this compound disk was called "two adjustable devices." The Patent Office held that the compound disk constituted but a single adjustable device or single disk, and rejected the third claim, to which rejection the owners of the patent assented. *Held* that they did not thereby abandon the right to claim in a subsequent reissue a double or compound disk and obtain a valid patent therefor.
[*Yale Lock Manufacturing Company *et al. v.* New Haven Savings Bank, 115.

2. INEXCUSABLE DELAY IN APPLYING FOR REISSUE RENDERS THE SAME INVALID.
The delay in filing the application for the reissue in suit not accounted for nor shown to be reasonable renders such reissue invalid.
[*Hoskin *et al. v.* Fisher *et al.*, 509.

3. INVENTIONS NOT ASSERTED IN OBTAINING ORIGINAL PATENT ABANDONED OR WAIVED.
Where it does not appear that any attempt had been made to secure by the original patent the inventions covered by the new claims in the reissue, those inventions must be regarded as having been waived or abandoned so far as the reissue is concerned. [*Id.

4. PRACTICE—WHEN RECORD IS INCOMPLETE.
Where the contention of the plaintiff was that the inventor only knew of the invalidity of his first reissue by the result in an earlier suit upon the same, and did not have evidence of these facts in the record, he should have brought by *certiorari* before this Court such parts of the record as the defendants had omitted to bring before us. [*Id.

5. REISSUE VOID FOR CHANGE OF ORIGINAL INVENTION.
The original patent and the first reissue having been distinctly limited to a bushing having a notch, the second reissue, obtained nearly seven years afterward, for a bushing without any such notch, is an unwarrantable enlargement.
[*Cornell *v.* Weidner, 985.

6. REISSUE—MODEL ALONE NOT SUFFICIENT BASIS.
The rule in *Parker & Whipple Co. v. Yale Lock Co.* (123 U. S., 87; 35 O. G., 290) affirmed that the Patent Office model alone is not to be considered the basis for a reissue in which a change of the invention of the original patent is sought.
[*Flower *et al. v.* City of Detroit, 1348.

7. ACCEPTANCE OF PATENT WITH KNOWLEDGE OF DEFECT A BAR TO REISSUE.
A party who voluntarily takes his patent with full knowledge at the time that the specification or claims are defective and fails to cover his entire invention, or that the patent in other respects is inoperative or invalid, because of the omission of an amendment which he petitioned the Commissioner to admit, which petition was refused because of insufficient showing, cannot thereafter maintain an assertion of inadvertence, accident, or mistake, such as would justify the Office in granting him a reissue to correct the errors.
[*Ex parte* Page and Krausse, 1455.

8. SAME.
The inadvertence, accident, or mistake contemplated by the statute relates to the form and character of the specification and claims as they stand at the date of issue. (*Ex parte Mahnken*, 40 O. G., 915; 41 O. G., 1389.) [Id.

REJECTED CASES.

(See Reissues, 1.)

REJECTION OF APPLICATIONS FOR DESIGN PATENTS.

(See Design Patents, 6.)

RESERVATION FOR SUBSEQUENT PATENTS.

1. RESERVATION CLAUSES CONDEMNED.
Ex parte Roberts (40 O. G., 573) discussed, and distinction pointed out between cross-references and reservation clauses.
[*Ex parte* Blair, 113.

2. SAME.
The introduction of reservation clauses covering subject-matter intended to be incorporated in future applications erects a warning by which the public is deterred from entering upon the particular field of invention, and also prevents the public from knowing just what property it is purchasing in dealing with patents containing reserved rights. [Id.

3. SAME.
The natural and necessary effect of reservation clauses is to unlawfully prolong the monopoly of the invention. If as a matter of fact and law the subject-matter is properly divisible, the Office is open at all times to applicant, and his rights are safe without any reservation clause. If such be not the case, applicant has ample protection by filing his second application and have it pending concurrently with the first. [Id.

4. APPARATUS AND PROCESS—CROSS-REFERENCES.
If the inventions are so nearly related to each other—as in case of an apparatus and process—that an application covering one invention discloses the other, applicant may fully protect his rights by incorporating in the applications cross-references, the effect of which would be the announcement that the invention claimed in the one was not the same as that claimed in the other. [Id.

RIGHTS OF ASSIGNEES.

(See Assignees.)

ROYALTY.

(See Damages and Profits, 8, 9, 12.)

SEAL.

(See Official Documents.)

SECOND APPLICATION.

(See Reservation for Subsequent Patents, 2, 3.)

SEPARATE INVENTIONS.

(See Amendments, 7; Design Patents, 2.)

SETTLEMENT OF SUIT.

(See Injunction, 4.)

SETTLEMENT OF SUIT BY ONE OF SEVERAL DEFENDANTS WHERE THE INFRINGEMENT WAS JOINT DISCHARGES ALL OF THE DEFENDANTS.
Where in a suit against two defendants for a joint infringement one of the defendants had made a settlement by a writing under seal for the costs and damages by the infringement of such defendant, but by such writing the other defendant was expressly not included in such settlement, the settlement was a satisfaction of the infringement by both defendants both as to damages and costs.
[*Babcock & Wilcox Company *v.* Pioneer Iron Works, 756.

SOLE INVENTOR.

TECHNICAL TERMS.

(See Claims, 2; Construction of Claims, 1; Design Patents, 1.)

1. INFRINGEMENT—INJUNCTION.
The use of words which are technically descriptive will be enjoined where it appears that they are used as a means of effecting a fraud.
[*Moxie Nerve Food Company *v.* Various Defendants, 868.

2. USE OF TECHNICAL TERMS.
The words "means," "mechanism," and "connections" are proper terms when applied to devices forming no part of the invention, but which are in common use in various kinds of machinery—*for* instance, when the operation of rollers is governed by gearing, belting, cranks, or other appliances which in themselves are simple and have little or nothing to do with the real invention. Or, as in the present case, the term "means," when applied to the operation or shaking of certain movable screens, is proper, because evidently the same movement of the screens can be effected by an infinite variety of mechanism which would produce the same result and be simply the equivalent of that employed by applicant.
[*Ex parte* Stoughton, 1345.

3. SAME.
The term "mechanism" is not permissible when applied to various and different devices in the several claims which are not adjunctive devices.
[*Ex parte* Stanbridge, 1345.

TERM OF PATENT.

(See Limitation of United States Patents by Foreign Patents Previously Granted; Particular Patents, 20.)

TESTIMONY.

1. IS A WIFE A COMPETENT WITNESS FOR HER HUSBAND IN AN INTERFERENCE PROCEEDING BEFORE THE PATENT OFFICE?
The question as to whether husband and wife are competent and compellable to testify for or against each other must be determined by the law in force in the jurisdiction in which the Patent Office is located, whether that jurisdiction may be said to be the entire United States or the District of Columbia. The question of competency must be determined in accordance with either the common law, the statute law, or both.
[Marsh *v.* Rein *v.* Ruppel, 1453.

2. WHAT RULE OF EVIDENCE MUST BE OBSERVED BY THE COMMISSIONER OF PATENTS IN THE DISCHARGE OF HIS LIMITED JURISDICTION?
While the Commissioner of Patents is authorized to establish rules and regulations for taking depositions, he is necessarily compelled to proceed under and in accordance with the laws of Congress. He has no power to legislate as to the competency of witnesses, nor as to the admissibility of evidence. Such rules of evidence as Congress establishes or recognizes for courts of general jurisdiction must be deemed to be prescribed for officers and tribunals of inferior and limited powers and jurisdictions, unless they are expressly excepted or special rules are made for them. While sections 876 and 877 (Rev. Stats. of the D. C.) do not specifically name the Patent Office, and may not be held to embrace it as a court or tribunal, still there has never been any law of evidence prescribed for it, except as it has been prescribed for the courts. In other words, the law of evidence recognized in the courts for their guidance, whether common law, statute law, or both, becomes, *proprio vigore*, the law for the Patent Office and other Bureaus, except when otherwise provided. [Id.

3. HUSBAND AND WIFE ARE NOT COMPETENT WITNESSES FOR OR AGAINST EACH OTHER IN INTERFERENCE PROCEEDINGS.
Inasmuch as it seems to be well settled that the common-law provision as to husband and wife is in force in the District of Columbia, it follows that husband and wife are not competent witnesses for or against each other in the tribunals and for the purposes mentioned in sections 876 and 877 of the Revised Statutes of the District of Columbia. [Id.

TESTIMONY IN INTERFERENCE PROCEEDINGS.

(See Interference, 3; Preliminary Statements.)

TWO YEARS' LIMITATION.

(See Diligence.)

UNITED STATES COURTS.

(See Jurisdiction, 1, 2; Jurisdiction of United States Courts.)

VALID PATENTS.

(See Particular Patents, 3, 4, 5, 17, 18, 23, 28.)

VOID PATENTS.

(See Construction of Claims, 4; Invention; Particular Patents, 1, 2, 16, 19, 21, 22, 24, 25, 26, 28, 29, 30; Process and Product; Reissues, 2, 3, 5.)

WITHDRAWAL OF CASE FROM ISSUE.

PETITIONS DENIED UNLESS WORKING IRREPARABLE INJURY.
An applicant who has had his day in the Office, and whose application has received full consideration and has been passed to issue, ought not to be permitted to withdraw his case from issue and submit amendments which should have been earlier proposed, and thus put the Office to the trouble of making a reexamination. Unless a showing of *irreparable injury* is made to appear, such petitions will be denied and applicant required to file a new application covering the subject of his proposed amendment, or he may abandon his original application, pay a new fee, and file another application in the form desired.
[*Ex parte* Page and Krausse, 1455.

WITNESSES.

(See Testimony.)

Breese, John H., Minneapolis, Minn. Pocket-box for postage-stamps	383,036	May 15	1724	449	43	862
Breese, John H., Minneapolis, Minn. Device for holding and moistening postage-stamps	383,037	May 15	1726	449	43	863
Brennan & Co. Southwestern Agricultural Works. (See Wolfe, Harvey R., assignor.)						
Brettell, George E., assignor of one-third to W. A. Wilson, Rochester, N. Y. Automatic fuel-regulator for boilers	383,557	May 29	2522	665	43	1027
Brewer, Horatio J., New York, N. Y. Galvanic battery	380,855	Apr. 10	629	225	43	171
Brewer, Horatio J., New York, N. Y. Galvanic battery	380,856	Apr. 10	630	225	43	172
Brewer, Ora A. (See Brewer, Thomas R. and O. A.)						
Brewer, Thomas H. and O. A., Pawnee Rock, Kans. Windmill	380,547	Apr. 3	366	104	43	75
Brewer, William J., London, county of Middlesex, England. Car-truck	384,505	June 12	1001	261	43	1319
Brewer, William J., London, county of Middlesex, England. Anti-friction bearing for shafts	384,506	June 12	1002	261	43	1319
Brewers Ice Company. (See Reis, John, assignor.)						
Brewington, Henry S., Baltimore, Md. Wash-board	382,751	May 15	1313	345	43	780
Brewster, Edward E., Holly, Mich. Rein-holder	380,676	Apr. 10	565	156	43	123
Brice, Thomas, Sandy Hill, N. Y. Fire-escape	383,340	May 22	2173	574	43	957
Bridenbaugh, Phillip H. (See Gorsuch, George W., assignor.)						
Bridenthal, Hezekiah Vincennes, Ind., assignor of eleven-twelfths to J. E. Hall, St. Louis, Mo. Bolting-reel	381,324	Apr. 17	1539	415	43	316
Bridge, Lewis, Philadelphia, Pa., assignor to Pennsylvania Globe Gas Light Company, of Pennsylvania. Gas-stove	383,793	May 29	2873	755	43	1099
Bridger, Edward K. (See Jones and Bridger.)						
Bridwell, James W., Hillsborough, Ohio, assignor to Star Manufacturing Company, of Ohio. Package-carrier	384,558	June 12	1077	281	43	1333
Briggs, Louis W., *et al.* (See Lore, George W., assignor.)						
Brigham, Kasson A., Gilroy, Cal. Two-wheeled vehicle	380,744	Apr. 10	661	182	43	141
Bright, Fred E., Cleveland, Ohio. Garment-supporter	385,237	June 26	2095	537	43	1551
Brinckerhoff, Henry W., Brooklyn, N. Y. Expansible joint for pipes	381,825	Apr. 24	2292	596	43	480
Brinckerhoff, Henry W., Brooklyn, N. Y., assignor to J. F. Ward, Jersey City, N. J. Spherical pipe-joint	381,826	Apr. 24	2293	596 / 597	43	480
Bringold, John H., assignor of one-half to W. N. Percy, Albany, N. Y. Belt-tightener	382,587	May 8	1083	278 / 279	43	727
Brinkerhoff, Alexander W., deceased, Upper Sandusky, Ohio; M. H. and W. C. Brinkerhoff executors. Syringe	383,940	June 5	149	43	43	1149
Brinkerhoff, Milford H., *et al.*, executors. (See Brinkerhoff, Alexander W.)						
Brinkerhoff, Warren M., Auburn, N. Y. Spring-tooth for harrows	384,188	June 5	513	140	43	1281
Brinkerhoff, Willie C., *et al.*, executors. (See Brinkerhoff, Alexander W.)						
Brinkmann, Augustus H. (See Buschmann, Victor H., assignor.)						
Bristol, Lambert J., New Haven, Conn. Whiffletree-snap	381,325	Apr. 17	1540	415	43	316
Bristol, William H., and W. E. Geyer, Hoboken, N. J. Differential expansion device for galvanometers	383,095	May 22	1929	480	43	891
Britton, Clarence R., *et al.* (See Peacock, John W., assignor.)						
Britton, William H., assignor of one-half to W. H. Britton, Jr., J. M. Richmond, and A. S. McAllaster, Buffalo, N. Y. Railway-tie	382,134	May 1	379	99	43	583
Broad, Thomas. (See Anderson, Lee, assignor.)						
Broadbent, Charles F., Baltimore, Md. Composition of matter to be used in the manufacture of medallions, &c	383,698	May 29	2709	.....	43	1069
Broadhurst, Daniel, Dunmore, Pa. Spring for locomotives	380,548	Apr. 3	368	105	43	75
Broady, Marion T., Bartle, Ind. Car-coupling	384,675	June 19	1248	329	43	1375
Brock, Matthias, Boston, Mass. Mechanism for grinding dies	380,985	Apr. 10	1037	275	41	210
Broderick, Martin, Bedias, Tex. Hammock or swing	381,827	Apr. 24	2295	597	43	480
Brodrick, Allen W., Mahomet, Ill. Windmill	384,232	June 12	569	160	43	1244
Brokaw, Isaac, assignor of one-half to A. F. Warneke, Litchfield, Ill. Sash-holder	384,607	June 19	1149	304	43	1355
Bronka & Company, E. J., *et al.* (See Brooks, Edward J., assignor.)						
Brooks, David, Jr., assignor to Electric Cable Construction and Maintenance Company, Philadelphia, Pa. Anti-induction composition for electric cables	383,096	May 22	1831	.....	43	891
Brooks, David, Jr., assignor to Electric Cable Construction and Maintenance Company, Philadelphia, Pa. Support for electric wires	383,097	May 22	1831	480	43	892
Brooks, David, Jr., assignor to Electric Cable Construction and Maintenance Company, Philadelphia, Pa. Covering for electric wires and cables	383,098	May 22	1832	.....	43	892

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Brooks, Edward J., East Orange, N. J., assignor to E. J. Brooks & Company, New York, N. Y., and C. H. Crosby, Chicago, Ill. Safety-case for money-packages, &c	381,326	Apr. 17	1541	416	43	317
Brooks, George W., Mebane, N. C. Apparatus for treating leaf-tobacco	385,038	June 26	1802	463	43	1491
Brooks, James W., trustee. (See Allen, Edward B., assignor.)						
Brooks, James W., trustee. (See Cunningham, James H., assignor.)						
Brooks, James W., trustee. (See Glidden, Charles W., assignor.)						
Brooks, James W., trustee. (See Goddu, Louis, assignor.)						
Broslus, John M., Atlanta, Ga. Motor	382,865	May 15	1463	381	43	811
Broslus, John M., assignor of one-half to T. H. Jones, Atlanta, Ga. Running-gear. (Reissue)	10,922	Apr. 17	1841	487	43	375
Brott, John R., assignor to W. W. Coomes, Long Meadow, Mass. Chair	384,887	June 19	1570	408	43	1435
Brougher, David J., Cincinnati, Ohio, assignor of two-thirds to W. Griffith, Covington, Ky., and J. Seymour, Oakley, Ohio. Angle-clamp for the corners of tables, desks, &c	383,167	May 22	1927	504	43	911
Brower, Fredrick C., Syracuse, N. Y. Automatic electric gas cut-off for railway-cars	384,676	June 19	1250	330	43	1375
Brown, Alexander E. (See Thompson, Charles H., assignor.)						
Brown, Alexander E., Cleveland, Ohio. Tramway for carrying elevated loads	382,634	May 8	1148	295 / 296	43	739
Brown, Alexander E., Cleveland, Ohio. Elevated tramway for hoisting and conveying machines	382,635	May 8	1150	296	43	739
Brown, Alexander E., Cleveland, Ohio. Apparatus for handling material	382,846	May 15	1577	419	43	854
Brown, Alexander T., Syracuse, N. Y. Air-gun	381,109	Apr. 17	1945	335	43	260
Brown, Charles A., and M. M. Clark, assignors to Western Electric Company, Chicago, Ill. Galvanic battery	384,958	June 26	1665	433	43	1468
Brown, Charles F. (See Hodskinson, Jabez, assignor.)						
Brown, Charles F. (See Riedell, John H., assignor.)						
Brown, Charles M., Rockford, Ill. Compound-lever punch	382,947	May 15	1580	412	43	834
Brown, Charles T., assignor to F. L. Brown, Chicago, Ill. Electric smelling-bottle	383,794	May 29	2875	756	43	1099
Brown, Daniel T., Roxbury, Conn. Knife-blade burnisher	380,327	Apr. 17	1543	416	43	317
Brown, Edward G. (See King and Brown.)						
Brown, Elmer E., Portland, Me., assignor of one-half to J. S. Williams, Boston, Mass. Safety rein-fastener	382,796	May 15	1379	302	43	783
Brown, Flora L. (See Brown, Charles T., assignor.)						
Brown, George, San Francisco, Cal. Protecting piles	381,671	Apr. 24	2057	538	43	436
Brown, George A., Pittsburg, Pa. Shield or cover for heaters and stoves for use on railway-cars	383,615	May 29	2597	686	43	1045
Brown, Gilman W., West Newbury, Mass. Lubricator	382,752	May 15	1313	345	43	780
Brown, Henry A., Denver, Colo. Apparatus for drilling and countersinking	381,311	Apr. 3	7	2	43	4
Brown, James C., Sedalia, Mo. Mail-bag lock	380,986	Apr. 10	1041	275	43	211
Brown, James H., Richmond, Ind. Car-brake	384,507	June 12	1003	261	43	1319
Brown, James O. (See Newell and Brown.)						
Brown, John C., *et al.* (See Herndon, George P., assignor.)						
Brown, John E., Honolulu, Hawaii. Sash-fastener	381,210	Apr. 17	1375	308	43	263
Brown, John H. (See McGaffey, Ives W., assignor.)						
Brown, John W. (See Smidow, John M., assignor.)						
Brown, Joseph W., Miltonvale, Kans. Cultivator for listed corn	380,549	Apr. 3	369	105	43	75
Brown, Morris H., Yonkers, N. Y. Rail or bar bender	383,168	May 22	1928	504	43	911
Brown, Perry, Louisville, Ky. Freight-car	382,685	May 15	1380	330	43	764
Brown, Perry, Louisville, Ky. Seal-lock	383,434	May 29	2325	616 / 617	43	990
Brown, Peter S. (See Orr and Brown.)						
Brown Specialty Manufacturing Company. (See Campfield, Matthew E., assignor.)						
Brown, William, Selkirk, Scotland. Carding-engine	383,435	May 29	2327	617 / 618	43	991
Brown, William, Duncannon, assignor of one-half to H. W. Sheibley, Philadelphia, Pa. Portable fire-escape	381,672	Apr. 24	2056	538	43	437
Brown, William H. (See Wright and Brown.)						
Brown, William H., Indianapolis, Ind. Fire-proof floor	384,491	June 12	871	227	43	1295
Brown, William J., Jr., assignor to Wire Staple Company, Philadelphia, Pa. Machine for setting staples	382,025	May 1	217	58	43	553
Browne, Charles H., Milwaukee, Wis. Flour-bolt	382,135	May 1	380	99	43	583
Browne, Thomas E. (See Huffman, Orlando, assignor.)						
Browne, Walker G., Atlanta, Ga., assignor to United States Automatic Water Cut-Off Company, of Georgia. Automatic cut-off	380,987	Apr. 10	1042	275 / 276	43	211
Browne, Walker G., Atlanta, Ga., assignor to United States Automatic Water Cut-Off Company, of Georgia. Anti-freezing device for water-pipes	382,588	May 8	1084	279	43	727
Browne, Walter D., Seneca Falls, assignor to F. C. Timpson, Auburn, N. Y. Electric signaling-box	383,941	June 5	150	44	43	1149
Brownell, Daniel W., Newton Centre, Mass. Harness-hook	383,341	May 22	2174	575	43	957
Brownell, Emerson P., Beebe Plain, Quebec, Canada. Manufacturing spools	384,677	June 19	1252	329	43	1375
Brownell, Frederick B., St. Louis, Mo. Passenger-vehicle	380,617	Apr. 3	468	132	43	95
Browning, Clinton, Shoosetown, Pa. Cigar-bunching machine	383,342	May 22	2175	575 / 576	43	957
Browning, John M. and M. S., Ogden, Utah Ter. Magazine fire-arm	385,238	June 26	2096	537	43	1551
Browning, Matthew S. (See Browning, John M. and M. S.)						
Broylea, George E., assignor of two-thirds to C. W. Gray and F. A. Vaughan, Ringgold, Ga. Vehicle-wheel	384,189	June 5	515	140	43	1221
Bruce, Hunter, St. Thomas, Ontario, assignor of one-half to I. H. Radford, Toronto, Canada. Spark-arrester	382,948	May 15	1582	413	43	834
Bruegger, Abraham, Jr., assignor to E. B. Preston, Chicago, Ill. Water-tower truck	383,699	May 29	2710	715 / 716	43	1069
Brumbaugh, Samuel A., Chicago, Ill. Automatic feed for boring bars	383,210	May 22	1987	521	43	923
Brüser, Frank, assignor of one-half to W. Charles, Pittsburg, Pa. Nut-making machine	381,872	Apr. 24	2365	614 / 615	43	494
Brush, Charles F., Cleveland, Ohio. Governor for electro-magnetic motors	383,857	June 5	11	4	43	1123
Brush Electric Company. (See Seymour, Henry A., assignor.)						
Brusie, James, Oakland, Cal. Animal-trap	383,700	May 29	2714	717	43	1070
Brusa, Julius, Milwaukee, Wis. Split pulley	384,014	June 5	255	73	43	1170
Bruyière, John, Chicago, Ill. Clutch	385,083	June 26	1881	481	43	1500
Bryan, Belden T., Evansville, Wis. Wrench	384,743	June 19	1350	352	43	1394
Bryan, Thomas A. (See Smith, Ely, and Bryan.)						
Bryant, Calvin, assignor of one-half to S. C. Keeler, Keene, N. H. Band sawing-machine	380,857	Apr. 10	631	226	43	172
Bryant, Clark B. (See Goodrich, E. Elmer, assignor.)						
Bryant, Edson L., assignor of one-half to Wallace & Sons, Ansonia, Conn. Lamp-extinguisher	380,858	Apr. 10	632	226	43	172

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Bryant, Zenas F., Malden, assignor of one-half to W. H. Park, Boston, Mass. Curtain-fixture	382,797	May 15	1380	342	43	783
Bryar, Samuel B., Pittsburg, Pa. Feed-pipe for boilers	382,753	May 15	1315	{345 346}	43	781
Buchanan, Charles H., Philadelphia, Pa. Last	384,015	June 5	255	73	43	1171
Buchanan, James, Indianapolis, Ind. Band-cutter	382,686	May 15	1292	321	43	764
Buchanan, Jesse J., Bridgeport, Ill. Wire fence	384,016	June 5	256	73	43	1171
Buckeye Engine Company. (See Thompson, Joseph W., assignor.)						
Buckley, Chauncey, Meriden Conn. Curtain-fixture	382,509	May 8	956	242	43	701
Buckley, John. (See Davison and Buckley.)						
Buckman, Benjamin J., assignor to Heywood Brothers & Co., Gardner, Mass. Knockdown rattan chair	383,169	May 22	1930	{504 505}	43	911
Buckwalter, Joseph A., assignor to Buckwalter Stove Company, Royer's Ford, Pa. Dust-fine for stoves	383,386	May 22	2249	598	43	970
Buckwalter Stove Company. (See Buckwalter, Joseph A., assignor.)						
Buffington, Leroy S., Minneapolis, Minn. Iron-building construction	383,170	May 22	1931	{505 506}	43	911
Bugbee, Almon C. (See Lamprey and Bugbee.)						
Bugbee, George C., North Attleborough, Mass., assignor of one-half to S. K. Merrill & Co., Providence, R. I. Hinged shoe-button	381,398	Apr. 17	1543	416	43	317
Bugbee, George W., Delhi, and F. Danner, Home City, assignors to Egan Company, Cincinnati, Ohio. Mortising-machine	384,559	June 12	1077	282	43	1333
Bugbee, George W., and F. Danner, assignors to Egan Company, Cincinnati, Ohio. Countershaft	384,560	June 12	1079	282	43	1333
Bugg, Owen T., Louisville, Ky., assignor, by mesne assignments, to United States Cotton Harvester Company, of New York. Cotton-harvester	383,099	May 22	1833	480	43	892
Buick, David D., Detroit, Mich. Siphon water-closet	383,032	May 15	1728	450	43	863
Bull, William B., Quincy, Ill. Device for preventing incrustation in steam-boilers	383,795	May 29	2875	756	43	1099
Bullitt, Logan M., and O. C. Greene, St. Paul, Minn. Electro-magnetic signaling device for mines	380,382	Apr. 3	116	34	43	25
Bump, Herman L., McMillan, Wis. Saw-filing machine	381,610	Apr. 24	1975	519	43	420
Bundy, Nathan A. (See Hebbard, George H., assignor.)						
Bunker, William I., assignor to Rocker Spring Company, Chicago, Ill. Chair	384,608	June 19	1150	304	43	1355
Burckard, Augustus, assignor of one-third to E. D. Miller, Baltimore, Md. Carpet-cleaning machine	381,110	Apr. 17	1246	335	43	259
Burdett, John F., Lowell, Mass. Cash-carrier apparatus	381,052	Apr. 10	1141	305	43	229
Burdon, Levi L., Providence, R. I. Straightening tubes	381,526	Apr. 24	1855	491	43	396
Burdon, Levi L., Providence, R. I. Making compound ingots	381,527	Apr. 24	1857	491	43	396
Burdsall, Ellwood. (See Preston, Henry M., assignor.)						
Burdsall, Stephen, assignor to J. V. Beery and D. Davis, Fremont, Ohio. Running-gear for vehicles	382,636	May 8	1151	297	43	730
Burfeind, Hermann, Frohna, Mo. Clover-seed harvester	383,796	May 29	2876	{756 757}	43	1100
Burger, F. Alonzo. (See Robinson, Clark, assignor.)						
Burke, J. A. (See Ritchel, Charles F., assignor.)						
Burkhardt, George, *et al.* (See Marks, Louis, assignor.)						
Burlin, Anson A., Jamestown, N. Y. Table attachment for chairs	382,687	May 15	1233	321	43	764
Burlingame, Charles H. C. (See Beath, William H., assignor.)						
Burman, William. (See Phipps and Burman.) (Reissue.)						
Burnett, Charles E., Girard, Ill. Draft-equalizer	384,190	June 5	516	141	43	1221
Burnham, Charles E., White Plains, N. Y. Clock striking mechanism	384,191	June 5	517	141	43	1222
Burnham, Nathan F., York, Pa. Turbine water-wheel	382,026	May 1	219	58	43	554
Burnham, Walter, Hyde Park, Ill. Molding viscous metals	383,039	May 15	1729	.....	43	863
Burnham, William H., and J. H. Miller, assignors to United States Wind Engine and Pump Company, Batavia, Ill. Compensating pump-rod	381,211	Apr. 17	1376	368	43	284
Burnham, William H., and J. H. Miller, assignors to United States Wind Engine and Pump Company, Batavia, Ill. Pump	381,212	Apr. 17	1377	368	43	284
Burns, Charles A. (See Swafford and Burns.)						
Burns, Silver & Co. (See Crofut, David F., assignor.)						
Burridge, Thomas H., St. Louis, Mo. Car-brake	383,387	May 22	2249	598	43	970
Burritt, Albert M., Waterbury, Conn. Machine for tapping steam, gas, or water fittings	381,053	Apr. 10	1141	305	43	230
Burrows, Everett L. (See Bailey, Fred E., assignor.)						
Burson, Samuel M., Hanoverton, Ohio. Tail-piece for stringed instruments	383,276	May 22	2091	549	43	942
Burton, Augustus G., Chicago, Ill. Safe-lock	383,040	May 15	1731	{450 451}	43	863
Burton, Augustus G., Chicago, Ill. Safe-lock	383,041	May 15	1737	{451 452}	43	864
Burton, Augustus G., Chicago, Ill., assignor of one-half to J. C. Harris, Dayton, Ohio. Safe-lock	382,071	May 1	290	77, 78	43	567
Busch, Carl, Chicago, Ill. Electric comb	384,561	June 12	1081	282	43	1334
Buschick, Gustavus E., and F. Rautert, Chicago, Ill. Nail-machine	384,422	June 12	872	227	43	1295
Buschmann, Victor H., assignor to A. H. Brinkmann, Baltimore, Md. Bustle	385,296	June 26	2196	561	43	1570
Bush, M. M. (See Herrington, Ephraim, assignor.)						
Bush, William C. (See Blair and Bush.)						
Bushnell, John S. (See Thompson, Richard, assignor.)						
Bushnell, Oscar P., Worcester, Mass. Molding-press for oil-cakes	385,094	June 26	1885	{481 482}	43	1508
Bussler, Otto, Nuremberg, Bavaria, Germany. Lead-pencil holder	381,611	Apr. 24	1977	520	43	420
Bussler, Otto, Nuremberg, Bavaria, Germany. Pencil-holder	381,612	Apr. 24	1979	520	43	420
Butenschon, John B., Portland, Oreg. Counter-scale	381,673	Apr. 24	2062	539	43	437
Butler, Edward S., New York, N. Y. Cartridge-feed indicator for fire-arms	382,455	May 8	873	223	43	694
Butler, Samuel A., *et al.* (See Dean, Henry W., assignor.)						
Butler, William H. (See Gill, Butler, and Smith.)						
Butterworth, Benjamin, trustee. (See Heckert, William, assignor.)						
Buxton, Levi W. (See Shaw and Buxton.)						
Byar, John. (See Tatman and Byar.)						
Byllesby, Henry M. (See Schmid and Byllesby.)						
Byllesby Henry M. (See Shallenberger and Byllesby.)						
Byllesby, Henry M., assignor to Westinghouse Electric Company, Pittsburg, Pa. Armature for dynamos and motors	383,617	May 29	2599	687	43	1045
Byllesby, Henry M., assignor to Westinghouse Electric Company, Pittsburg, Pa. Synchronizing device for alternate-current dynamos	383,618	May 29	2599	687	43	1045
Byllesby, Henry M., assignor to Westinghouse Electric Company, Pittsburg, Pa. Armature for dynamos and motors	383,619	May 29	2600	687	43	1046

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Byllesby, Henry M., assignor to Westinghouse Electric Company, Pittsburg, Pa. Combined alternate-current and storage system of electrical distribution	383,620	May 29	2601	688	43	1046
Byllesby, Henry M., assignor to Westinghouse Electric Company, Pittsburg, Pa. Alternate-current and storage system of electrical distribution	383,621	May 29	2603	{688 689}	43	1046
Byllesby, Henry M., assignor to Westinghouse Electric Company, Pittsburg, Pa. Alternate-current and storage system of electrical distribution	383,622	May 29	2605	689	43	1047
Byllesby, Henry M., assignor to Westinghouse Electric Company, Pittsburg, Pa. Combined alternate-current and storage system of electrical distribution	383,623	May 29	2606	689	43	1047
Byllesby, Henry M., Pittsburg, and O. B. Shallenberger, Rochester, assignors to Westinghouse Electric Company, Pittsburg, Pa. Alternate-current system of electrical distribution	381,054	Apr. 10	1143	{305 306}	43	230

Crane, Thomas R., Heathsville, Va. Shoe for grain-drill tubes	381,465	Apr. 17	1755	469	43	357
Crawford, Francis E., New Sharon, Iowa. Butter-worker	380,967	Apr. 10	849	229	43	175
Crawford, James, Cambridge, Mass. Service-box for water-closets	381,934	May 1	20	5	43	518
Crawford, James, Cambridge, Mass. Water-closet	383,045	May 15	1749	452	43	806
Crawford, William H., assignor of one-half to J. R. Snow, Paris, Tex. Churn	383,866	June 5	24	8	43	1125
Crecelius, Louis J., assignor of one-half to A. Warren, St. Louis, Mo. Lifting-jack	383,709	May 29	2728	720	43	1073
Crecelius, Louis J., assignor of one-half to A. Warren, St. Louis, Mo. Lifting and lowering jack	383,710	May 29	2730	720	43	1074
Cree, William O., and G. A. Clough, Jr., Beverly, Mass. Dieing-out machine for boot or shoe soles	382,294	May 8	692	159	43	638
Creelman, John A., assignor of one-half to G. H. Graham, Rochester, N. Y. Stop-valve	381,055	Apr. 10	1146	306	43	230
Crippen, Edwin, and W. King, New Orleans, La. Snap-hook	380,997	Apr. 10	1056	279	43	213
Crisp, Joseph E. (See Copeland and Crisp.)						
Criswell, James A., Philadelphia, Pa. Lubricating attachment for railway-cars	383,558	May 29	2723	665	43	1029
Crocker, Henry, Bristol, R. I. Scrap-book	384,746	June 19	1353	353	43	1385
Crockett, Edward R., assignor of one-half to J. H. Hodges, Georgetown, Tex. Trace-carrier	382,216	May 1	492	127	43	604
Crofut, David F., assignor to Burns, Silver & Co., Bridgeport, Conn. Ticket-holder	383,797	May 29	2878	757	43	1100
Cromer, Lawrence W., and G. Gavin, assignors to themselves and F. M. Heitman, Eureka, Nev. Automatic switch and frog for railways	381,676	Apr. 24	2066	540	43	436
Crompton Loom Works. (See Wyman, Horace, assignor.)						
Crompton, Rookes E. B., and G. Kapp, Chelmsford, county of Essex, England. Galvanometer	383,444	May 29	2335	620	43	993
Cronk, William, Havana, N. Y. Combined door-hanger, rail, and rail-bracket	384,296	June 12	594	161	43	1245
Crosby, Chauncey H., *et al.* (See Brooks, Edward J., assignor.)						
Crosby, Daniel W. (See Helwitz, Ellis S., assignor.)						
Crosby, Daniel W., trustee. (See Hewett, Ernest M., assignor.)						
Crosby, Joseph E., Westfield, N. J. Ash-sifter	383,173	May 22	1935	507, 508	43	913
Crosier, Byron A., Sandusky, Ohio. Lawn-mower attachment	383,632	May 29	2816	692	43	1049
Cross, Frederick E., Waterbury, Conn., assignor to Eagle Pencil Company, New York, N. Y. Rubber-tip attachment for pencils and the like	384,563	June 12	1064	283	43	1334
Crouch, Frank J., Eugene City, Oreg. Rheostat	383,345	May 22	2160	577	43	958
Crouch, George, New York, N. Y. Combined trunk-lift and strap-fastening	385,942	June 26	2102	538	43	1502
Crouch, George, New York, N. Y. Fastening for hand-bags and satchels	385,943	June 26	2103	539	43	1553
Crouch, Robert B. (See Wiser, Clinton B., assignor.)						
Crowdus, Walter A., Dallas, Tex. Fare-box	382,756	May 15	1318	347	43	791
Crowdus, Walter A., and H. M. Sutton, Dallas, Tex. Dynamo electric machine	380,620	Apr. 3	471	133	43	96
Crowell, Charles F., Portland, Oreg. Shoe-tongue fastening	385,045	June 26	1815	466	43	1493
Crowell, Hilen C., Erie, Pa. Friction-clutch	380,584	Apr. 3	190	35	43	25
Crowell, Hilen C., Cuyahoga Falls, Ohio. Friction-clutch	383,104	May 22	1839	492	43	893
Crowell, Luther C., Brooklyn, assignor to R. and P. S. Hoe, S. D. Tucker, T. H. Mead, and C. W. Carpenter, New York, N. Y. Folding-machine	383,798	May 29	2879	757, 758, 759	43	1100
Crowell, Luther C., Brooklyn, assignor to R. and P. S. Hoe, S. D. Tucker, T. H. Mead, and C. W. Carpenter, New York, N. Y. Delivery mechanism for printing-machines	383,799	May 29	2883	759, 760, 761	43	1101
Crowell, Luther C., Brooklyn, assignor to R. and P. S. Hoe, S. D. Tucker, T. H. Mead, and C. W. Carpenter, New York, N. Y. Delivery mechanism for printing-machines	383,800	May 29	2888	761, 762, 763	43	1101
Crull, Lafayette. (See McLaughlin, James T. W., assignor.)						
Crumley, David M., Steubenville, Ohio. Fire-grate	381,969	May 1	151	38	43	542
Cudahy, Michael. (See Coleman, Arnold D., assignor.)						
Culley, George H. (See Logan and Culley.)						
Cully, William W., Wilson, Kans. Pump	381,532	Apr. 24	1865	493	43	398
Culp, Alpha B., Wakarusa, Ind. Fence	384,764	June 12	1084	283	43	1334
Culp, James D., San Felipe, Cal. Electrophorus	383,165	May 22	1840	492	43	893
Culver, Lucian M., and W. F. Smith, Kiowa, Kans. Envelope-holder	381,677	Apr. 24	2068	540	43	439
Cumming, George, assignor of one-half to F. Smith, San Francisco, Cal. Pipe-riveting machine	382,142	May 1	389	101, 102	43	585
Cumming, James, Buffalo, N. Y. Railway-crossing	381,056	Apr. 10	1147	306	43	230
Cumming, James, Boston, Mass. Tension mechanism for sewing-machines	381,912	May 1	21	6	43	519
Cummings, Michael J., New York, N. Y. Wheel for hand-trucks	383,314	May 22	1993	502	43	924
Cumnock, Alexander G. (See Falls, Alonzo, assignor.)						
Cuningham, John, Manito, Ill. End-gate	381,057	Apr. 10	1149	306	43	231
Cunningham, Henry C., Manchester, N. H., assignor to G. Draper & Sons, Hopedale, Mass. Yarn-separator for spinning-frames	380,644	Apr. 3	501	140	43	102
Cunningham, James H., Brockton, assignor to J. W. Brooks, trustee, Cambridge, Mass. Heel-machine	381,493	Apr. 17	1798	478	43	367
Curl, Jesse B., Des Moines, Iowa. Self-heating flat-iron	383,346	May 22	2181	577	43	958
Currey, Edward C., South Evanston, Ill., assignor to Evener Spring Company, of New York. Whiffletree-spring	382,353	May 8	718	181	43	655
Currie, Stanley C. C. (See Timmis and Currie.)						
Currie, Stanley C. C., London, county of Middlesex, England, assignor to Currie-Timmis Electric and Railway Supply Company, (limited.) Electric railway-signal	384,902	June 26	1669	434	43	1463
Currie-Timmis Electric and Railway Supply Company. (See Currie, Stanley C. C., assignor.)						
Currier, George S., Garnett, Kans. Car-mover	382,757	May 15	1320	347	43	792
Curtin, Henry, assignor of one-half to W. Hose, Little Falls, N. Y. Circular-knitting machine	380,385	Apr. 3	121	35	43	26
Curtis, Charles A., *et al.* (See Kree, Hiram C., assignor.)						
Curtis, John L., Milwaukee, Wis. Ratchet	382,637	May 8	1158	297	43	740

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drgs.	Official Gazette. Vol.	Official Gazette. Page.

Dale, John R., assignor of one-half to E. D. Dougherty, Philadelphia, Pa. Cable-gripping apparatus for street-railways	385,246	June 26	2106	539	43	1553
Dancel, Christian. (See Valiant and Dancel.)						
Daniels, Fred H., Worcester, Mass. Reeling apparatus for rod-rolling mills	381,217	Apr. 17	1384	370	43	285
Daniels, Fred H., Worcester, Mass. Apparatus for annealing wire	385,247	June 26	2110	540	43	1554
Daniels, Fred H., Worcester, Mass. Apparatus for charging billets, bars, &c., into furnaces	385,248	June 26	2112	540	43	1554
Daniels, Fred H., Worcester, Mass. Apparatus for charging billets, bars, &c., into furnaces	385,249	June 26	2116	540	43	1555
Daniels, Fred H., Worcester, Mass. Apparatus for charging billets, bars, &c., into furnaces	385,250	June 26	2118	541	43	1556
Daniels, Fred H., Worcester, Mass. Apparatus for charging billets or bars into heating-furnaces	385,251	June 26	2120	541	43	1556
Daniels, Joseph, Cleveland, Ohio. Open ring	382,853	May 15	1588	414	43	838
Danielson, Carl R., Rockford, Ill. Soldering-iron	381,533	Apr. 24	1866	493	43	398
Dann Bros. & Company. (See Dann, John A., assignor.)						
Dann, John A., assignor to Dann Bros. & Company, New Haven, Conn. Paneling-machine	383,711	May 29	2732	720	43	1074
Danner, Frederick. (See Bugbee and Danner.)						
Danner, John, assignor to J. Danner Manufacturing Company, Canton, Ohio. Clothes-rack	384,194	June 5	523	142	43	1228
Danner Manufacturing Company, John. (See Danner, John, assignor.)						
Darby, Elijah F. (See Blackburn and Darby.)						
Darling, Charles E., and H. Free, Lewiston, Me. Tobacco-pipe	384,681	June 19	1258	330	43	1377
Darling, John G., *et al.* (See Clarke, Reuben, assignor.)						
Dart, J. W. (See Swarts, Henry J., assignor.)						
Daul, Anthony, Brooklyn, assignor to G. Heerbrandt, New York, N. Y. Churn	380,553	Apr. 3	373	106	43	76
Davey, Petherick, assignor of three-fourths to S. W. Leedom, Philadelphia, Pa. Berth, chair, &c	383,868	June 5	27	9	43	1126
Davids, Theodor, Hanover, Prussia, Germany. Polishing apparatus for wood, &c	385,171	June 26	1991	510	43	1530
Davidson, Joseph F., assignor to E. N. Hatcher, Columbus, Ohio. Manufacture of thimble-skeins for axles	381,218	Apr. 17	1386	370	43	286
Davie, William M. (See Hodges and Davie.)						
Davies, James, Wednesbury, county of Stafford, England. Disk water-meter	384,024	June 5	266	76	43	1173
Davies, John R., Pullman, Ill. Sand-molding machine	382,217	May 1	493	128, 129	43	604
Davies, John R., Pullman, Ill., assignor to Allen Paper Car Wheel Company, of New Jersey. Apparatus for casting car-wheels	381,115	Apr. 17	1253	336	43	260
Davies, Lewis W., Eureka, Nev. Obtaining the precious metals from ores	384,662	June 19	1258	.....	43	1377
Davies, Thomas, Peabody, Mass. Apparatus for bleaching and dyeing	383,869	June 5	28	9	43	1126
Davies, Walter D., Brooklyn, N. Y., assignor to Ansonia Clock Company, Ansonia, Conn. Stem winding and setting watch	381,219	Apr. 17	1387	371	43	286
Davis, Arthur H., and G. Keith, Earlville, Ill. Horse-collar fastening	384,227	June 5	573	156	43	1228
Davis, Charles A., Washington, D. C. Railway-car	383,712	May 29	2733	721	43	1074
Davis, Charles E., assignor to J. W. Norris, Chicago, Ill. Seal-lock	381,534	Apr. 24	1867	493	43	398
Davis, David, *et al.* (See Burdsall, Stephen, assignor.)						
Davis, Edward E., Detroit, Mich. Fifth-wheel for vehicles	380,868	Apr. 10	850	230	43	175
Davis, Erneat J. S., Great Bend, Kans. Barrel-truck	381,769	Apr. 24	2185	571	43	469
Davis, Everette O., Jersey, Ga. Plow-fender	380,998	Apr. 10	1057	279	43	214
Davis & Farber Machine Company. (See Wright, Elijah, assignor.)						
Davis, Henry A., Lowell, Mass. Machine for opening cotton	384,826	June 19	1478	386	43	1419
Davis, Isaac P. (See Patterson and Davis.)						
Davis, Jay C., assignor of one-half to G. Suebert, Marshfield, Wis. Whiffletree-hook	380,621	Apr. 3	473	133	43	96
Davis, John. (See Abrahams, John W., assignor.)						
Davis, John, Allegheny, Pa. Pipe-coupling	381,913	May 1	22	6	43	519
Davis, John, Allegheny, Pa. Pipe-coupling	382,514	May 8	963	243	43	702
Davis, John S., Toledo, assignor to A. E. Sumner, Cleveland, Ohio. Harvester	384,025	June 5	267	76, 77	43	1173
Davis, Minor M., Brooklyn, N. Y. Static compensator for telegraphs	381,220	Apr. 17	1388	371	43	286
Davis, Reese O., Milan, Mo., assignor to Steddard Manufacturing Company, Dayton, Ohio. Combined hay rake and ricker	385,252	June 26	2122	541, 542	43	1557
Davis, Willis, assignor of one-half to A. D. Rose, Woodstock, N. Y. Hobby-horse	381,116	Apr. 17	1254	336	43	261
Davis, Zebulon, Cleveland, Ohio. Vapor-stove burner	384,511	June 12	1008	262	43	1280
Davis, Zebulon, assignor to Consolidated Vapor Stove Company, Cleveland, Ohio. Vapor-stove	383,870	June 5	30	10	43	1127
Davison, George W., and J. Buckley, Rochester, N. Y. Shaping-machine	384,963	June 26	1671	434	43	1464
Davy, John W., assignor to Excelsior Iron Fence Company, (limited,) Kingston, Ontario, Canada. Fence-post	381,873	Apr. 24	2406	615	43	494
Dawes, John L., and W. G. Walter, Pittsburg, Pa. Druggist's sign	383,445	May 29	2338	621	43	993
Dawson, Joseph R., Knoxville, assignor of one-half to H. C. Longbertels, Star, Iowa. Road-grading machine	384,894	June 19	1577	410	43	1437
Day, Abraham, Bloomfield, N. J. Machine for cutting dough	384,964	June 26	1673	435	43	1464
Day, Andrew J., *et al.* (See Roberts, Henry, assignor.)						
Day, B. Frank, Sellersville, Pa. Gas-governor	384,132	June 5	428	119	43	1203
De Aguiar, Abelardo G., Havana, Cuba. Bagasse drier and furnace	380,999	Apr. 10	1058	279, 280	43	214
DeBaun, Benoni T., *et al.* (See Rice, James, assignor.)						
De Benardos, Nicholas, St. Petersburg, Russia. Secondary battery	380,554	Apr. 3	374	107	43	77
DeBorger, Frank J., Babylon, assignor of one-half to T. F. Neville, New York, and S. Morse, Babylon, N. Y. Rendering collars water-proof	385,163	June 26	1903	485	43	1512
De Cew, William, Aylmer, Ontario, Canada. Car-coupling	381,914	May 1	23	6	43	519

Dederick, Levi, Albany, N. Y. Extension fire-ladder	383,107	May 22	1846	483	43	895
Dederick, Peter K., Loudonville, N. Y. Baling-press	382,144	May 1	392	102	43	585
Dederick, Peter K., Albany, N. Y. Baling-press	382,954	May 15	1589	415	43	836
Deevy, Patrick, Hastings, Nebr. Wheeled scraper	380,314	Apr. 3	11	3	43	4
Dehnert, Max, Deuben, Saxony, Germany. Pneumatic mustard-pot	382,218	May 1	496	129	43	605
Deininger, Michael F., Brooklyn, N. Y. Hearse	380,622	Apr. 3	474	134	43	96
Deissler, Peter and W., Philadelphia, Pa. Meat-cutter	383,713	May 29	2736	721	43	1075
Deissler, William. (See Deissler, Peter and W.)						
Delaney, Henry J. (See Starkenberg, Felix, assignor.)						
Delano, Alphonso F., Hyde Park, assignor to Smith American Organ and Piano Company, Boston, Mass. Piano-case	385,172	June 26	1993	511	43	1530
Delany, Patrick B., New York, N. Y. Telegraphy	381,764	Apr. 24	2187	572	43	461
Delmonico, Charles C. (See Lemaire, Henri F. M., assignor.)						
Demarest, John, assignor to J. L. Mott Iron Works, New York, N. Y. Flushing apparatus for water-closets, &c.	381,221	Apr. 17	1389	371	43	286
Dengolesky, William, Booneville, Mo. Brick-machine	381,315	Apr. 17	1576	421	43	324
Denison, Richard, assignor of one-half to J. Blakey, Leeds, county of York, England. File-cutting machine	384,133	June 5	429	{119 / 120}	43	1204
Denny, Edward B., Newark, N. J. Device for mixing gas and air	382,076	May 1	301	79, 80	43	568
Densmore, Edwin, assignor to W. T. Powers & Son, Grand Rapids, Mich. Veneer-cutting machine	382,219	May 1	497	129	43	605
Derby Silver Company. (See Berry, Henry, assignor.)						
Derington, John H., and H. J. Parker, Springfield, Mo.; said Derington assignor to said Parker. Machine for making barbs for hog-nose rings	382,603	May 15	1243	324	43	766
Dernell, Herman M. (See Beebe, Theodore S., assignor.)						
Derrickson, Joseph W. (See Pennock, William H., assignor.)						
Des Brisay, James, Kamloops, British Columbia, Canada. Valve-gear	381,678	Apr. 24	2069	{540 / 541}	43	439
Determann, John B., assignor of one-half to J. F. Wagner, Louisville, Ky. Sheet-metal siding for covering the walls of buildings	381,600	Apr. 10	1060	280	43	216
Detroit Car Wheel Company. (See Pasco, Thomas H., assignor.)						
Detroit Motor Company. (See Slater, Henry B., assignor.)						
Detroit Steam Radiator Company. (See Taylor, Harrison H., assignor.)						
Detroit Steel and Spring Works. (See Holmes, William G., assignor.)						
Deuther, Lorenz A., Buffalo, N. Y. Advertising-sign	381,766	Apr. 24	2190	572	43	462
Deutsch, Eugen. (See Nöltner, Ambrosius, assignor.)						
Devean, Edward A. (See Baker, Halsey H., assignor.)						
Devereux, Joel, assignor to G. S. Lord, Culbertson, Nebr. Windmill	381,679	Apr. 24	2071	541	43	439
Devereux, Walter B., Aspen, Colo. Apparatus for separating lead or base bullion in smelting from slag, matties, and speiss	381,118	Apr. 17	1257	337	43	261
Devereux, Walter B., Aspen, Colo. Apparatus for separating base bullion from slag, matties, and speiss	381,119	Apr. 17	1259	337	43	262
Devereux, Walter B., Aspen, Colo. Apparatus for separating lead and base bullion from slag	384,349	June 12	767	200	43	1274
Devling, Amelia E. (See Devling, James W., assignor.)						
Devling, James W., assignor of seven-eighths to A. E. Devling, Flemington, Pa. Limekiln	384,895	June 19	1578	411	43	1437
Devoll, William C. (See Devolld and Devoll.)						
Devolld, William, and W. C. Devoll, near St. Mary's, Kans. Animal-trap	384,827	June 19	1479	386	43	1419
Devore, Levi M., assignor of one-half to R. H. Wiles and W. Greene, Freeport, Ill. Ornamental wire coil	382,220	May 1	499	129	43	606
Devore, Levi M., and W. Greene, Freeport, Ill. Stove-back	381,535	Apr. 24	1869	494	43	398
Devore, William B. (See Baker, Henry R., assignor.)						
Devoy, Martin, Syracuse, N. Y. Caster attachment for stoves or furniture	381,120	Apr. 17	1262	338	43	262
Dewberry, William A., Peace, Ark. Sawing-machine	380,386	Apr. 3	122	36	43	26
Dewees Fabric Trimmer Company. (See Dewees, John W., assignor.)						
Dewees, John W., Philadelphia, Pa. Trimming attachment for sewing-machines	381,537	Apr. 24	1871	{494 / 495}	43	309

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Dewees, John W., assignor to Dewees Fabric Trimmer Company, (limited,) Philadelphia, Pa. Welt-trimmer for sewing-machines	381,536	Apr. 24	1870	494	43	308
Dexter, Avelyn I., Whitewater, Wis. Refrigerator	384,965	June 26	1675	435	43	1464
Day, Anna L., New York, N. Y. Buffet for housekeeping	383,871	June 5	31	10	43	1127
Day, Harry E., New York, N. Y. Electric-lighting apparatus for railway-cars	381,915	May 1	25	7	43	519
Day, Lewis R., Camden, N. J. Carpet-stretcher	382,295	May 8	624	159	43	670
Dick, Augustus C., Cincinnati, Ohio. Apparatus for springing target-traps	383,446	May 29	2339	621	43	983
Dick, Frank W., Glasgow, county of Lanark, Scotland. Piston water-meter	382,145	May 1	394	103	43	586
Dick, Jacob, Jerseyville, Ill. Portable elevator	382,077	May 1	305	80	43	569
Dick, Robert. (See Kennedy, Rankin, assignor.)						
Dickerson, Edward N., Jr. (See Haasenkamp, Ernst, assignor.)						
Dickerson, William M., assignor of one-half to L. W. Holloway, Indianapolis, Ind. Band-saw mill	381,406	Apr. 17	1756	470	43	358
Dickey, Adam, Hamilton, Ohio. Hammock	381,538	Apr. 24	1873	495	43	309
Dickey, Cyrus M. and E. E., New Garden, Ohio. Churn	383,633	May 29	2617	692	43	1049
Dickey, Etta E. (See Dickey, Cyrus M. and E. E.)						
Dickinson, P. P. (See Plumb, William H., assignor.)						
Dickson, John A., Pulaski, Tenn. Horse-detacher	383,447	May 29	2340	621	43	994
Diebold, Carl, assignor to Diebold Safe and Lock Company, Canton, Ohio. Bolt	384,238	June 12	596	161	43	1245
Diebold Safe and Lock Company. (See Diebold, Carl, assignor.)						
Diebold Safe and Lock Company. (See Kirks, Albert, assignor.)						
Diehl, Philip, Elizabeth, N. J. Electric motor	381,222	Apr. 17	1391	{371 / 372}	43	287
Dieterich, Daniel D., *et al.* (See Powell, John B., assignor.)						
Dietz Company, R. E. (See Betts, Charles L., assignor.)						
Dietz Company, R. E., *et al.* (See Betts, Lewis F., assignor.)						
Dietz, Robert E. (See Betts, Lewis F., assignor.)						
Dietz, William H., Chicago, Ill. Dating device	384,026	June 5	274	77	43	1173
Diffley, Thomas, Rosemount, Minn. Pump attachment	385,104	June 26	1903	485	43	1512
Dilger, Theodore, Liberal, Ind. Brake-lever	384,027	June 5	276	77	43	1174
Dilley, Clarence M., Jackson, Mich. Combined door bell and alarm	381,539	Apr. 24	1875	495	43	309
Dillon, James M. (See Lutz and Dillon.)						
Dillon, Philip F., Savannah, Ga. Metallic mold	382,411	May 8	801	{304 / 305}	43	671
Dillon, William S. F., Cincinnati, assignor of one-third to G. Hall, Lima, Ohio. Harness hook or snap	384,512	June 12	1010	263	43	1330
Dimmick, Charles M., *et al.* (See Gasking, George H., assignor.)						
Dimon, Frank S., Fort Scott, Kans. Tire-tightener	382,955	May 15	1591	415	43	836
Dimond, Henry C. (See Way, Frank K., assignor.)						
Dinkel, George, Jersey City, N. J. Steam-trap	380,791	Apr. 10	739	202	43	155
Dinsmore, Alfred S., Boston, Mass. Gas-stove	384,683	June 19	1259	{330 / 331}	43	1377
Dinsmore, John H. R., Liverpool, county of Lancaster, England. Manufacturing illuminating-gas from coal	383,634	May 29	2018	693	43	1050
Dinsmore, John H. R., Liverpool, county of Lancaster, England. Apparatus for washing and purifying illuminating-gas	383,635	May 29	2020	693	43	1050
Disbrow, Samuel, Lewis, Iowa. Potato-plow	384,310	June 12	702	187	43	1264
Diss, Louis P., Ilion, N. Y. Breech-loading gun	383,108	May 22	1848	{483 / 484}	43	895
Dithridge, George W., New York, N. Y. Center bearing for car-trucks	380,870	Apr. 10	852	230	43	175
Divekey, John J., Aurora, Ill. Garden-hose carriage	381,540	Apr. 24	1876	495	43	400
Dixon, Charles A., assignor to R. Whitehill, Newburg, N. Y. Releasing valve-gear	381,001	Apr. 10	1061	{280 / 281 / 282}	43	214
Dixon, John F., Clay Centre, Kans. Vehicle-axle	381,829	Apr. 24	2297	597	43	481
Dixon, John G., New York, N. Y. Collar and cuff drier and dampener	382,800	May 15	1383	363	43	794
Dixon, Theron S. E., Hyde Park, Ill. Railway-car	384,828	June 19	1480	386	43	1419
Dixon, Theron S. E., assignor of one-half to L. Hill, Chicago, Ill. Air-brake	382,031	May 1	227	60	43	555
Dixon, Theron S. E., assignor of one-half to L. Hill, Chicago, Ill. Air-brake for railway cars	382,032	May 1	234	60, 61	43	556
Doak, Robert, Sidney, Ohio. Drag-saw	381,830	Apr. 24	2298	598	43	481
Dobler, Anton, assignor to C. Dobler, New York, N. Y. Grinding-mill	381,346	Apr. 17	1579	423	43	324
Dobler, Charles. (See Dobler, Anton, assignor.)						
Dohyns, James W., Wood Lawn, Va. Harrow	384,966	June 26	1676	435	43	1465
Dodge, James M., Philadelphia, Pa. Chain conveyer for handling coal	382,638	May 8	1153	297	43	740
Dodge Manufacturing Company. (See Phillon, George, assignor.)						
Dodge, Wallace H., Mishawaka, Ind. Means for securing pulleys on shafts	383,281	May 22	2100	554	43	943
Dodge, Wallace H., Mishawaka, Ind. Slack-take-up for rope transmission	383,282	May 22	2101	554	43	944
Dodge, Walter E., Everett, assignor to National Tube Works Company, Boston, Mass. Injector	383,109	May 22	1850	484	43	896
Dodsworth, Robert. (See Holdsworth, John W., assignor.)						
Doerflinger, William, La Crosse, Wis. Apparatus for storing, measuring, and exhibiting dry goods, &c.	384,747	June 19	1354	{353 / 354}	43	1395
Doetschmann, Albert, Nyack, N. Y. Extinguishing fires in stoves	383,283	May 22	2102	555	43	944
Doggett, John, assignor of one-half to L. J. King, Plain City, Ohio. Combined telegraph key and sounder	384,350	June 12	770	200	43	1275
Dohis, Prosper A., Paris, France. Spring-motor	382,033	May 1	239	61	43	557
Dolge, Carl B., Brooklyn, N. Y. Chin-rest for the dead	384,513	June 12	1011	263	43	1330
Dollner, Charles F. (See Rose, John, assignor.)						
Dolsen, William B., Moberly, Mo. Device for loading vehicles	383,636	May 29	2022	694	43	1050
Domeier, Albert, and O. C. Hagemann, London, England, assignors to said Domeier and J. Glatz, Brooklyn, N. Y. Making resin-soap and glycerine	385,105	June 26	1904	.....	43	1512
Donahue, John J. (See Thompson, William D., assignor.)						
Donaldson, Walter H., assignor of one-half to R. B. Reid, San Francisco, Cal. Metallic railway-tie	381,059	Apr. 10	1151	307	43	231
Doney, Charles, Ottawa, Ontario, Canada. Heel-plate	382,694	May 15	1244	324	43	708
Donkel, Lloyd H., Winter Park, Fla. Velocipede	381,134	June 5	434	120	43	1204
Donkel, Lloyd H., Winter Park, Fla. Vehicle-wheel	384,135	June 5	435	121	43	1205
Donnell, Columbus W., Fulton, Mo. Bed-spring	381,060	Apr. 10	1152	307	43	231
Donnell, Edward P., Chicago, Ill. Paper-cutting machine	383,714	May 29	2738	{721 / 722}	43	1075
Donnelly, John, San Mateo, Cal. Gate	384,136	June 5	436	121	43	1205
Doolittle, George, assignor, by mesne assignments, to S. H. Hubbard, Bridgeport, and J. K. Beach, New Haven, Conn., trustees. Manufacture of upholstery-tufts	384,896	June 19	1580	411	43	1437
Doran, Bernard S., Johnstown, Pa. Railway track and joint	385,253	June 26	2126	542	43	1557

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Dorman, Benjamin H. (See Phillips, John O., assignor.)						
Dorsey, Basil C., Tulare, assignor of one-half to W. L. Morrow, San Luis Obispo, Cal. Disk cultivator and seeder	384,748	June 19	1356	354	43	1395
Dorst, John W., Detroit, Mich. Pillow-sham holder	384,330	June 12	597	168	43	1245
Doty, Hezekiah, San José, Cal. Churn	382,639	May 8	1155	287	43	749
Doty, Joseph, Wellsville, N. Y. Corner-iron	380,871	Apr. 10	853	230	43	176
Doub, John H., and F. Robbins, Walnut, Kans.; said Robbins assignor to said Doub. Washing-machine	384,311	June 12	702	187	43	1284
Doubleday, Harry M., Columbus, Ohio. Incandescent-lamp attachment	383,046	May 15	1751	453	43	867
Dougal, Charles H., *et al.* (See Bostian, Charles P., assignor.)						
Dougherty, Edward D. (See Dale, John H., assignor.)						
Douglas, Charles H., assignor of one-half to C. S. Baker, Chicago, Ill. Machine for making blanks for chain-cutter teeth	383,347	May 22	2189	578	43	939
Douglass, Benajah H., Jr. (See Bartholomew, Joel O., assignor.)						
Douglass, J. Walter. (See Bormann, Hermann, assignor.)						
Douglass, Roswell S., *et al.* (See Hamblin, Silvanus and S. M., assignors.)						
Dover Stamping Company. (See Hadley, Ethan, assignor.)						
Dowling, Robert H., assignor of two-thirds to C. and C. H. Follett, Newark, Ohio. Car-coupling	385,301	June 26	2205	565	43	1572
Dowling, Thomas W., Detroit, Mich. Window-screen	380,747	Apr. 10	654	{183 / 184}	43	143
Downerd, Hiram S., Zanesville, Ohio. Electrical annunciator	384,430	June 12	881	229	43	1297
Downes, David H., Pullman, Ill. Forging-machine	383,047	May 15	1751	453	43	867
Downs, George N., Chicago, Ill., assignor to Troy Laundry Machinery Company, Troy, N. Y. Centrifugal machine	380,555	Apr. 3	376	107	43	77
Downton, Robert L., St. Louis, Mo. Dust arrester and collector	382,801	May 29	2692	783	43	1102
Dowson, Ralph, and J. Taylor, Bolton, county of Lancaster, England. Alarm-valve for automatic fire-extinguishers	384,514	June 12	1012	263	43	1301
Doyle, Frank, Chicago, assignor of one-half to J. Bairstow, Lake View, Ill. Apparatus for opening furnace-doors	384,137	June 5	436	121	43	1205
Doyle, John, Hoboken, N. J., assignor to himself and C. C. Dusenbury, Lake Mahopac, N. Y. Battery-zinc	385,254	June 26	2127	543	43	1557
Drake, John B., Goshen, Ind. Pump	384,749	June 19	1357	354	43	1395
Drake, John C., Altus, Ark. Washing-machine	383,110	May 22	1852	484	43	896
Drake, Spencer L., Swampscott, Mass. Hat-hanger	384,897	June 19	1580	411	43	1437
Draper, Charles, Springfield, Mass. Electric stop-motion for knitting-machines	382,583	May 8	1092	281	43	729
Draper, Daniel, Hastings-upon-Hudson, N. Y. Recording-thermometer	380,872	Apr. 10	854	231	43	176
Draper & Sons, George. (See Draper, William F. and G. A.)						
Draper & Sons, George. (See Cunningham, Henry C., assignor.)						
Draper & Sons, George. (See Draper, William F. and G. A., assignors.)						
Draper & Sons, George. (See Driscoll and Boylen, assignors.)						
Draper & Sons, George. (See Durkin, Daniel, assignor.)						
Draper, William F. and G. A., assignors to G. Draper & Sons, Hopedale, Mass. Support for spinning-spindles	383,048	May 15	1754	453	43	867
Dreadul, Paul, Chicago, Ill., assignor to Gilbert & Bennett Manufacturing Company, Georgetown, Conn. Conductor-strainer	380,873	Apr. 10	856	231	43	176
Dreabach, Clifton R. (See Grove, William H., assignor.)						
Dresse, Henry. (See Lodge and Dresse.)						
Dresser, Solomon R., Bradford, Pa. Pipe-coupling	381,916	May 1	96	7, 8	43	519
Drew, Hudson M., and J. A. Grant, New Limerick, Me. Lantern	381,636	Apr. 24	2304	599	43	482
Driller, Frank, Port Jervis, N. Y. Cut-off for spouts	381,990	May 1	152	39	43	543
Driscoll, William, and J. F. Boylen, Taunton, assignors of one-half to G. Draper & Sons, Hopedale, Mass. Fulcrum for the weight-levers for the rolls of spinning-frames	381,681	Apr. 24	2072	542	43	439
Driver, William, Manville, R. I. Picker-check for looms	382,640	May 8	1156	288	43	740
Droughton, John J., East Newark, N. J. Concentrator	383,284	May 22	2103	535	43	944
Drummond, James T., St. Louis, Mo. Utilizing tobacco waste	384,565	June 12	1066	{283 / 284}	43	1335
Drummond, James T., St. Louis, Mo. Apparatus for stemming tobacco	384,566	June 12	1067	284	43	1335
Drummond, John J. (See Gaseley, Frederick, assignor.)						
Du Bois, Louis, *et al.* (See Eldredge, John V. D., assignor.)						
Du Boulay, Digby, London, England. Motor	380,648	Apr. 3	511	143	43	104
Du Brul, Napoleon, Cincinnati, Ohio. Temporary partition for cigar-boxes	382,221	May 1	500	130	43	686
Du Cray, Charles C., Iowa County, Wis., assignor to himself and H. J. F. Webb, Dubuque, Iowa. Corn-planter	381,223	Apr. 17	1392	372	43	287
Du Pont, Alfred V., Louisville, Ky., assignor to Johnson Steel Street Rail Company, of Kentucky. Portable connecting track	381,674	Apr. 24	2367	{615 / 616}	43	494
Dudley, Plimmon H., New York, N. Y. Apparatus for impregnating wood	381,682	Apr. 24	2073	542	43	440
Dueber, John C. (See Coburn, John A., assignor.)						
Duffey, Hugh. (See Winter and Duffey.)						
Duffy, Kate M., Astoria, Oreg. Bed-pan	380,478	Apr. 3	251	69	43	51
Duffy, James, Buffalo, N. Y. Tube-expander	383,111	May 22	1853	484	43	896
Dugnan, John A., Quincy, Mass. Store-service apparatus	380,315	Apr. 3	13	3	43	5
Duhrkop, Frits, New York, N. Y. Baker's oven	380,536	Apr. 3	379	108	43	77
Duke, James B. (See Underwood, Joseph B., assignor.)						
Dulebohn, John G. (See Herr and Dulebohn.)						
Dum, William J., South Bloomfield, Ohio. Motor	380,557	Apr. 3	379	108	43	77
Dunbar, Andy L. (See Wilkins, Alexander G., assignor.)						
Dunbar, William E., Waxahachie, Tex. Machine for putting ties on bales	382,229	May 1	501	130	43	686
Duncan, Beverly W., assignor of one-half to I. Leedy, Dora, Ind. Hog-trap	380,649	Apr. 3	511	143	43	104
Duncan & Johnston. (See Apoil, Jacob, assignor.)						
Dunham, Calvin M., St. Joseph, Mo. Interest-calculator	384,431	June 12	882	220	43	1297
Dunham, Charles H., *et al.* (See Wellman, Willard F., assignor.)						
Dunham, Thomas H., Boston, Mass. Making banding for spinning-machines	384,138	June 5	438	.....	43	1205
Dunlevy, Mathew H. (See Beckfold, John, assignor.)						
Dunn, Andrew S., New Brighton, Pa. Band-saw-filing machine	383,944	June 5	153	45	43	1149
Dunn, William, assignor of two-thirds to D. B. Ruffner and G. S. Bolton, Philadelphia, Pa. Nut-lock	382,078	May 1	306	89	43	589
Dunn, William C., New York, N. Y. Game	384,240	June 12	598	168	43	1246
Dunnett, William, assignor of one-half to J. Regester & Sons, Baltimore, Md. Flushing-cisterns	381,294	Apr. 17	1394	372	43	287
Dunnett, William, assignor of one-half to J. Regester & Sons, Baltimore, Md. Attachment for wash-stands, bath-tubs, and sinks	381,295	Apr. 17	1395	373	43	288

Ericson, John, Sabine Pass, La. Floating oil-distributer for vessels	380,479	Apr. 3	252	69	43	58
Erie Car Heating Company. (See Botsford, Frederick G., assignor.)						
Ernst, George D., Buffalo, N. Y. Reversing-gear for printing-press cylinders	381,991	May 1	153	39	43	543
Ertel, John C. (See Meyer and Sutphen, assignors.)						
Erwin, Charles M., Birmingham, Ala., assignor of one-half to J. M. Watt and M. Whipple, Washington, D. C. Safety-flange for railway-rails	384,435	June 12	886	231	43	1298
Erwin, James B., Milwaukee, Wis. Air-compressor	382,760	May 15	1324	348	43	782
Erwin, James B., Milwaukee, Wis. Motor	384,612	June 19	1154	305, 306	43	1336
Eschner, Louis, Philadelphia, Pa. Implement for turning tubular fabrics	382,958	May 15	1594	416	43	837
Escobar, Juan de la Cruz, Matanzas, Cuba, assignor to F. G. Tilton, Newark, N. J. Type-writing machine	382,146	May 1	395	103	43	586
Escovar, Fernando, Mexico, Mexico. Alterative tonic	380,676	Apr. 10	862	.....	43	177
Esselbach, Joseph, Dresden, Saxony, Germany. Wire fastener for boxes	381,684	Apr. 24	2078	543	43	440
Esselburn, John. (See Marts and Esselburn.)						
Esser, Hermann, Hoboken, N. J. Ink-supplying device	384,699	June 19	1582	412	43	1438
Essex, Henry, Meadville, Pa. Machine for making wire nails	384,515	June 12	1014	264	43	1321
Essick, Samuel V., Brooklyn, N. Y. Printing-telegraph	383,450	May 29	2343	622, 623	43	994
Essig, Benton, assignor of one-half to S. Essig, Disko, Ind. Harrow	381,467	Apr. 17	1758	470	43	358
Essig, Selton. (See Essig, Benton, assignor.)						
Estabrook, Harry F., assignor to S. B. Estabrook, Worcester, Mass. Bird-food holder	382,255	May 1	558	141	43	616
Estabrook, Sarah B. (See Estabrook, Harry F., assignor.)						
Esterly, George, Whitewater, Wis. Harvester-reel	384,139	June 5	438	122	43	1205
Esterly, George, Whitewater, Wis. Grain-binder	384,140	June 5	440	122	43	1206
Esterly, George, Whitewater, Wis. Harvester	385,047	June 26	1817	466, 467	43	1494
Esterly Harvesting Machine Company. (See Agenten, Joseph, assignor.)						
Estes, James W., East Atchison, Mo. Potato-planter	384,353	June 12	774	201, 202	43	1275
Estey, David M. (See Clapp, Dwight C., assignor.)						
Ethridge, Martin V. B., Boston, assignor of one-half to H. E. Waite, West Newton, Mass. Water-current-power transmitter	382,959	May 15	1595	416	43	837
Ette, Charles G., St. Louis, Mo. Hydrant	382,642	May 8	1158	298	43	741
Ette, Charles G., St. Louis, Mo. Hydrant	382,960	May 15	1596	417	43	837
Ettling, Alice M. (See Cately, Shepard W., assignor.)						
Evans, Arthur K., Toronto, Ontario, Canada. Rope-grip or selvagee-strop	383,803	May 29	2895	764	43	1103
Evans, David, Ansonia, Conn. Machine for tinning copper sheets	383,116	May 22	1861	486	43	898
Evans, Hampton W., Philadelphia, Pa. Combined center, T, and try square, bevel, and clinometer	380,714	Apr. 10	614	169	43	131
Evans, James E., Cincinnati, Ohio. Velocipede	383,258	June 26	2131	544	43	1558
Evans, John W., Cleveland, Ohio. Percolator	381,062	Apr. 10	1154	308	43	232
Evans, Joseph W., Newburyport, Mass. Street-car	381,918	May 1	98	8	43	520
Evans, Lucius S., Alvarado, Tex. Combined revolving harrow and cultivator	383,286	May 22	2106	556	43	944
Evans, Thomas, New York, N. Y. Malt-mashing machine	384,568	June 12	1069	285, 286	43	1336
Evans, William, Jr., Philadelphia, Pa. Measuring-vessel	385,303	June 26	2207	566	43	1572
Evener Spring Company. (See Carrey, Edward C., assignor.)						
Everett, Charles J., Tenafly, N. J. Constructing street-curbing of artificial stone	382,602	May 15	1386	364	43	794
Everett, Willard S., Hyde Park, Mass. Harness-saddle tree	380,624	Apr. 3	476	134	43	97
Everitt, Percival, London, England. Apparatus for automatically closing receptacles for coins, &c.	382,606	May 15	1245	325	43	767
Everson, George R., assignor of one-half to W. L. Rockenfield, Cincinnati, Ohio. Sheet-metal folder	383,390	May 22	2252	599	43	970
Everson, George R., assignor of one-half to W. L. Rockenfield, Cincinnati, Ohio. Sheet-metal-bending machine	383,391	May 22	2254	599	43	971
Ewart Manufacturing Company. (See Ewart, William D., assignor.)						
Ewart, William D., assignor to Ewart Manufacturing Company, Chicago, Ill. Sprocket-wheel	382,079	May 1	306	80	43	569
Excelsior Iron Fence Company. (See Davy, John W., assignor.)						
Excelsior Manufacturing Company. (See O'Keefe, John, assignor.)						
Excelsior Metallic Packing Company. (See Pineh, Frank, assignor.)						
Expanded Metal Company. (See Golding, John F., assignor.)						
Expanded Metal Company. (See Golding and Burkee, assignors.)						
Eyaenbach, Henry P., Delphos, Ohio. Elastic folding display envelope	381,919	May 1	99	9	43	520
Faber, Eberhard. (See Musselman, Oscar, Jr., assignor.)						
Faber, William A., Danbury, Conn. Adjustable handle	384,098	June 5	277	77	43	1174
Facer, John. (See Hampton and Facer.)						
Fackenthall, Hart J., and D. Wallace, Philadelphia, Pa. Railway-rail pad	382,603	May 15	1387	364	43	795
Fahlberg, Constantin, assignor to Fahlberg, List & Co., Salbke Westerhüsen, Prussia, Germany. Apparatus for obtaining phosphorous trichloride	381,685	Apr. 24	2078	543	43	440
Fahlberg, List & Co. (See Fahlberg, Constantin, assignor.)						
Fahnestock, Fredrick S., Cohoes, N. Y. Potted-plant support	385,174	June 26	1997	511	43	1531
Fairbanks & Company, E. & T. (See Abbott, Arthur V., assignor.)						
Fairbanks, Crawford M., Lincoln, R. I. Machine for cutting files	380,751	Apr. 10	668	185	43	142
Fairbanks, Thaddeus, assignor to Feed-Water Heater Company, St. Johnsbury, Vt. Feed-water heater	381,618	Apr. 24	1986	521	43	422
Fairman, Simon, assignor to B. G. Harris, Baltimore, Md. Car-coupling	381,352	Apr. 17	1586	425	43	325
Fairman, Simon assignor to B. G. Harris, Baltimore, Md. Car-brake	381,353	Apr. 17	1587	425	43	326
Falen, Orange B., Canfield, Ohio. Hopple	382,869	May 15	1469	385	43	812
Falize, Lucien, Fils. (See Bapst and Falize.)						
Fallgatter, John A. (See Ward and Fallgatter.)						
Falls, Alonzo, assignor of one-half to A. G. Cumnock, Lowell, Mass. Mechanism for stripping the top-flats of carding-machines	382,598	May 8	1100	283	43	729
Falls Rivet Company. (See Keller, John A., assignor.)						
Farbenfabriken, vormals Fr. Bayer & Company. (See Hernberg, Martin, assignor.)						
Farbwerke, vormals Meister, Lucius & Brüning. (See Ullrich, Eduard, assignor.)						
Fargue, Robert H., Brooklyn, N. Y. Truss	383,717	May 29	2748	724	43	1076
Farina, Antoninus, assignor, by mesne assignments, to P. Farina, New York, N. Y. Shoe-heel	381,686	Apr. 24	2079	543	43	441
Farina, Petrina. (See Farina, Antoninus, assignor.)						
Farlow, James N., Lander, Wyo. Ter. Strap-edging machine	384,029	June 5	278	78	43	1174

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drs.	Official Gazette. Vol.	Official Gazette. Page.
Farlow, James N., Lander, Wyo. Ter. Hame	384,030	June 5	279	78	43	1174
Farmer, Moses G., Elliot, Me. Telephone-transmitter	380,426	Apr. 3	173	48	43	36
Farmer, Moses G., Elliot, Me. Telephone-transmitter	380,427	Apr. 3	175	48	43	36
Farmer, Moses G., Elliot, Me. Apparatus for forming sheets of nickel or other metal by electrolysis	381,004	Apr. 10	1065	283	43	215
Farmer, Conrad and G. Linder, Milwaukee, Wis. Knotter for grain-binders	384,245	June 12	610	164	43	1247
Farnham, Isaiah H., Malden, assignor to New England Telephone and Telegraph Company, Boston, Mass. Telephone-transmitter	380,752	Apr. 10	668	185	43	142
Farnsworth, George. (See Schmid, Charles, assignor.)						
Farr, William A., East Carmel, Ohio. Tension device for use in making fences	382,464	May 8	887	226	43	667
Farrar, Cyrus S., assignor of one-half to F. B. Wiggins, East Saginaw, Mich. Machine for sharpening saws, &c	384,613	June 19	1157	306	43	1356
Farrar, Frederick, Brooklyn, N. Y. Appliance for cleaning pipe-coils	382,147	May 1	396	{103 104}	43	566
Farrar, J. Hamilton, Chicago, Ill. Railway-signal	380,316	Apr. 3	14	3	43	5
Farrin, Lemuel J. (See Bachlott and Farris.)	382,870	May 15	1470	386	43	812
Farwell, Frederic E., Fitchburg, Mass. Bench for circular saws	380,560	Apr. 3	347	110	43	79
Fate, John L., Milwaukee, Wis. Station and street indicator	382,519	May 8	970	244	43	703
Fate, John L., Milwaukee, Wis. Station and street indicator	382,520	May 8	972	245	43	704
Faulkner, George S., Indianapoli Ind. Gas pressure-regulator and cut-off	384,967	June 26	1677	435	43	1465
Faulkner, James J., Jackson, Mich. Flour-mill	385,175	June 26	1997	512	43	1571
Faulkner, John, Austin, Ill. Supply-check and waste-pipe valve	384,633	June 19	1488	388	43	1490
Faure, Camille A., New York, N. Y., assignor to Electrical Accumulator Company, of New York. Automatic switch for secondary batteries	382,509	May 8	1102	283	43	730
Faure, Camille A., New York, N. Y., assignor to Electrical Accumulator Company, of New York. Propelling vehicles by electricity	383,561	May 29	2525	666	43	1028
Faure, Camille A., New York, N. Y., assignor to Electrical Accumulator Company, of New York. Secondary battery	383,562	May 29	2527	666	43	1028
Faure, Camille A., Paris, France, assignor to Electrical Accumulator Company, of New York. Secondary battery	383,560	May 29	2525	666	43	1028
Fanstmann, George, Philadelphia, Pa. Gimp-machine	385,048	June 26	1821	467	43	1484
Favell, Thomas M. (See Stokes, Loney, and Favell.)						
Fawell, Joseph, and J. Hemphill, Pittsburg, Pa. Rolling-mill	382,035	May 1	240	61, 62	43	558
Fay, Charles R., Auburn, N. Y. Suspending device	383,577	June 5	34	11	43	1128
Fay, Henry C., Worcester, Mass. Folding case	382,604	May 15	1368	364	43	785
Fearon, Charles, Philadelphia, Pa. Game-counter	380,428	Apr. 3	176	48	43	36
Feed Water Heater Company. (See Fairbanks, Thaddeus, assignor.)						
Feeney, Michael B., New York, N. Y. Automatic screen or door for obstructing the passage of flame	384,141	June 5	443	{122 123}	43	1206
Fehrer, Joseph, assignor of one-half to A. S. Bohn, Frederick, Md. Corn-planter	384,834	June 19	1489	{388 [illegible]}	43	1490
Feicker, Fredrick C., assignor to Northampton Cutlery Company, Northampton, Mass. Fork-guard	380,798	Apr. 10	742	203	43	156
Feicker, Fredrick C., assignor to Northampton Cutlery Company, Northampton, Mass. Fork-guard	384,900	June 19	1583	412	43	1438
Feldhaus, Henry B. (See Fink, John M., assignor.)						
Fellows, George A., Chicago, Ill. Cabinet-case for holding railway-folders	380,877	Apr. 10	863	232	43	177
Felthousen, E. G., *et al.* (See Hart, Thomas J., assignor.)						
Fenn, Henry, Bridgeport, Conn. Ticket-holder	384,684	June 19	1261	331	43	1377
Fenner, Richard E., assignor to C. K. Giles, Chicago, Ill. Electric-arc lamp	382,421	May 8	813	207	43	674
Ferguson, James. (See Humstone, Edwin M., assignor.)						
Ferguson, James. (See Rice, David H., assignor.)						
Ferce, Alfred E., Boston, Mass., assignor to E. C. Potts, Tivoli, N. Y. Making syrup and beer from maize. (Reissue)	10,925	May 1	606	{153 154}	43	694
Ferrell, Leonidas C., and D. Israel, Donaldsonville, La. Shackle	381,005	Apr. 10	1067	283	43	215
Ferrier, Philo, Ypsilanti, Mich. Roller-mill	380,878	Apr. 10	864	233	43	178
Ferris, George L., St. Louis, Mo. Type-writing machine	384,142	June 5	444	{123 124}	43	1206
Ferris, Hiram R. (See Young, Lambert, and Ferris.)						
Fesler, William H., Columbiana, Ohio. Billiard cue	384,614	June 19	1159	306	43	1357
Fessenden, George B., Boston, Mass. Watchman's time-detector	381,992	May 1	154	39	43	543
Fessenden, George B., Boston, Mass. Watchman's time-detector	381,993	May 1	156	39, 40	43	543
Field, Benjamin F., Chicago, Ill. Barrel-cover attachment	383,349	May 22	2187	578	43	960
Field, Stephen D., Yonkers, N. Y. Electric locomotor	380,879	Apr. 10	865	{233 234}	43	178
Field, Stephen D., Yonkers, N. Y. Electric locomotive	380,880	Apr. 10	871	234	43	179
Field, Stephen D., Yonkers, N. Y. Regulation of electric motors	381,768	Apr. 24	2192	574	43	462
Field, Stephen D., Yonkers, N. Y. Electric railway	384,685	June 19	1262	{331 332}	43	1377
Field, Walter D., Short Hills, N. J. Pyroxyline varnish	381,354	Apr. 17	1560	.....	43	326
Fielder, Edwin H. J., Providence, R. I. Picking sweep-strap connection for looms	382,600	May 8	1103	283	43	730
Fields, James H., Lebanon, Tenn. Car-coupling	382,517	May 29	2456	651	43	1015
Fifield, Charles S., Revere, Mass. Seam-rubbing machine	383,574	June 5	34	11	43	1128
Fifield, Zacheus B., St. Paul, Minn. Self-cleaning smoke-jack	383,575	June 5	35	12	43	1128
Fillebrown, Augustus A. (See Frost, Oscar F., assignor.)						
Filstrup, Lars L., Ravenswood, and G. Van Zandt, Chicago, Ill. Tuning-peg for stringed instruments	382,465	May 8	888	226	43	667
Finigan, Peter A., San Francisco, Cal. Stalls for separating horses on race-tracks	382,961	May 15	1597	417	43	837
Fink, John M., assignor of one-half to H. B. Feldhaus, Louisville, Ky. Press for forming leather saddle-trees	382,962	May 15	1599	{417 418}	43	837
Fink, Marx, Pittsburg, Pa. Ornamenting glass	384,569	June 12	1091	296	43	1336
Fink, Millard F., Middletown, Md. Gate	382,601	May 8	1104	283	43	730
Finke, Alberto, New Berlin, N. Y. Road-grader	383,350	May 22	2189	579	43	960
Finlay, Alexander K., New Orleans, La. Cooler for soda-water apparatus, &c	383,518	May 29	2457	651	43	1016
Finley, John E., Memphis, Tenn. Churn-dasher	380,753	Apr. 10	672	185	43	143
Firth, Edwin, A. and I. Tompkins, Troy, N. Y. Manufacture of axle-skeins	381,355	Apr. 17	1561	426	43	296
Fischbach, Wilhelm. (See Volkmann, Otto, assignor.)						
Fischer, Frank G., Harrold, Dak. Ter. Bag-holder	380,794	Apr. 10	743	204	43	156
Fischer, Frederick. (See Zelly, John, assignor.)						
Fischer, Frederick G., assignor of one-half to J. C. Higdon, Kansas City, Mo. Base-ball glove	381,687	Apr. 24	2090	544	43	441
Fischer, Friedrich, Des Moines, Iowa. Steam-engine	384,246	June 12	612	164	43	1246

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drs.	Official Gazette. Vol.	Official Gazette. Page.
Fish, Henry C. (See Pond and Norton, assignors.)						
Fisher, Charles. (See Rensland and Fisher.)						
Fisher, Edmund G., Minneapolis, Minn. Registering and recording weighing-scale	383,451	May 29	2344	{823 824}	43	994
Fisher, Frank E., Detroit, Mich. Telephone call-bell system	383,568	May 29	2548	{866 867}	43	1069
Fisher, Frank E., Detroit, Mich. Armature for electric motors	383,564	May 29	2529	667	43	1029
Fisher, Frank E., Detroit, Mich. Dynamo-armature	383,565	May 29	2530	667	43	1029
Fisher, Frank E., Detroit, Mich. Annunciator	383,566	May 29	2531	668	43	1029
Fisher, Frank E., Detroit, Mich. Armature for dynamos	383,567	May 29	2532	668	43	1029
Fisher, George, and P. Rappold, Toledo, Ohio. Alarm water-gage	380,681	Apr. 10	872	234	43	179
Fisher, Harvey L. (See Ballard and Fisher.)						
Fisher, James L., *et al.* (See Payne, Samuel A., assignor.)						
Fisher, Joseph H., Merchantville, N. J. Automatic wagon-brake	380,754	Apr. 10	672	186	43	143

Frederick, Carl C., Lancaster, Mo. Hanging sheet-metal guttering to the eaves of houses	381,770	Apr. 24	2194	574	43	463
Fredericks, William H., Johnstown, Pa. Apparatus for transferring pig-iron from its bed	380,025	Apr. 3	477	134	43	97
Free, Henry. (See Darling and Free.)						
Freeland, James R., assignor of one-half to E. C. Bradley, Wellsville, N. Y. Singletree	383,351	May 22	2192	579	43	961
Freeman, Edwin P. J., Roslyn, N. Y. Faucet	385,108	June 26	1906	486	43	1512
Freeman, George R., Middleville, Mich. Mop-wringer	382,965	May 15	1602	419	43	838
Freeman, George P., *et al.* (See Atkinson, William W., assignor.)						
Freeman, Scott C., and J. B. Soward, Nevada, Mo. Burglar-alarm	384,752	June 19	1361	355	43	1396
Freeman, Stephen, Racine, Wis. Cotton-chopper	384,516	June 12	1017	265	43	1322
Freese, John S., Brooklyn, N. Y. Button-hole sewing-machine	382,466	May 8	890	227, 228	43	687
Freese, Peter C., Cayuga, N. Y. Wire fence	383,804	May 29	2296	764	43	1103
Freitag, Andreas, assignor to Naamlooze Vennootschap Wester Suiker-Raffinaderij, Amsterdam, Netherlands. Centrifugal machine	382,966	May 15	1603	419	43	839
French, George B., Fremont, Nebr. Machine for softening and bending the horns of cattle	383,519	May 29	2458	651	43	1016
French, Nahum W., North Haverhill, N. H. Fence	381,496	Apr. 17	1803	479	43	368
French, Zachary T., and W. C. Meyer, Boston, Mass. Leather-gouging machine	381,994	May 1	159	40, 41	43	543
French, Zachary T., and W. C. Meyer, Boston, Mass. Machine for cutting and embossing button-holes	381,995	May 1	163	41, 42, 43	43	544
Frenier, John H., assignor of one-half to L. Leblanc, Rutland, Vt. Sand and water distributer for stone-sawing machines	384,615	June 19	1160	307	43	1357
Frey, John W., Baltimore, Md. Fire-escape ladder	382,150	May 1	400	105	43	587
Frey, Sheckler & Hoover. (See Niedergeaess, Robert, assignor.)						
Fridy, Sam M. (See Slaughter, David, assignor.)						
Fried, Hermann, Cannstadt, Würtemberg, Germany. Suspender-fastening	381,833	Apr. 24	2301	598	43	482
Friede, Samuel M., assignor of one-half to J. D. Abeles and L. Goldman, St. Louis, Mo. Street and station indicator	383,392	May 22	2255	600	43	971
Fries, Jacob, Reading, Pa. House-warming apparatus and stove	383,119	May 22	1866	487	43	899
Frischels, Fablan S., Lititz, Pa. Automatic car-link	383,453	May 29	2348	625	43	995
Frishmuth, William, assignor to W. H. Gaw, Philadelphia, Pa. Galvanic cell	380,430	Apr. 3	177	49	43	36
Fritts, Charles E., New York, N. Y. Production, transmission, and distribution of electric currents	383,580	May 29	2460	651, 652	43	1016
Froling, Hermann. (See Karges, Robert, assignor.)						
Frost, Daniel C., Springfield, Mass. Halter	381,123	Apr. 17	1265	338	43	263
Frost, Edward J., Philadelphia, Pa. Device for regulating the quality of carbureted vapor or gas	381,619	Apr. 24	1988	522	43	422
Frost, George, *et al.* (See Preston, Charles A., assignor.)						
Frost, George A., *et al.* (See Preston, Charles A., assignor.)						
Frost, John B., assignor of one half to C. E. Sheldon, Akron, Ohio. Riveting-machine	384,199	June 5	532	145, 146	43	1234
Frost, Oscar F., Monmouth, Me., assignor of one-half to A. A. Fillebrown, Ayer, Mass. Detachable shelf and heat regulator for ovens	381,229	Apr. 17	1404	375	43	289
Frost, Walter E., Lewiston, Me., assignor to Mousam Manufacturing Company, of Maine. Machine for stripping leather-board	384,032	June 5	282	79, 80	43	1175
Fry, Joseph H., Washington, D. C. Plow	382,297	May 8	686	160	43	639
Fuchs, Charles H., Sandusky, Ohio. Machine for the manufacture of chalk, crayons, &c.	383,174	May 22	1937	508	43	913
Fuller, Arthur, trustee. (See Gordon, William, assignor.)						
Fuller, Henry W. and W., Seneca, Kans. Calf-weaner	380,796	Apr. 10	744	204	43	156
Fuller, John W. (See Armeah, John G. E., assignor.)						
Fuller, Walter. (See Fuller, Henry W. and W.)						
Fullerton, George A., *et al.* (See Bradford, Charles K., assignor.)						
Fullerton, George A., Boston, Mass. Heel-stiffener machine	384,753	June 19	1362	356	43	1396
Fullerton, George A., assignor to G. H. P. Flagg, trustee, Boston, Mass. Machine for buffing boot or shoe soles	382,967	May 15	1604	419, 420	43	839
Fullmer, A. J. (See Williams, Walter D., assignor.)						
Fulton, Samuel W., near Northwood, Ohio. Fence-post	382,256	May 1	550	141	43	616
Furber, Harrison W., Boston, Mass. Boot or shoe	380,715	Apr. 10	616	169	43	132
Furnas, John D., Waynesville, Ohio. Spring	380,480	Apr. 3	251	70	43	52
Furniss, Frederick H., Waterloo, N. Y. Drive-well point	382,697	May 15	1246	326	43	767
Fyfer, John T. (See Henninger, Frederick A., assignor.)						
Gabbs, William H., San Francisco, Cal. Trunk-harness	380,431	Apr. 3	178	49	43	37
Gage, Loren F. (See Merithew, Zacheus W., assignor.)						
Gage, Mary S., St. Louis, Mo. Stove	381,517	June 12	1019	265	43	1322
Gail, Harry S., Highland Park, assignor to F. C. Austin, Chicago, Ill. Drilling-tool	381,124	Apr. 17	1266	339	43	264
Gaitley, John E., Troy, N. Y. Fire-poker	381,356	Apr. 17	1592	426	43	336
Gale, Charles E., assignor of one-half to C. W. Vaughn and E. H. Wood, Plattsburg, N. Y. Churn	384,518	June 12	1020	265	43	1322
Gale, Horatio, and C. D. Wiselogel, Albion, Mich. Pressure-regulator	381,877	June 5	38	12	43	1128
Gale, William L., Memphis, Mo. Clothes-drier	384,616	June 19	1161	307	43	1358
Gallaher, Benjamin D. (See Zallud, Karl, assignor.)						
Galland, Charles, Lyons, France. Newspaper-selling apparatus	382,521	May 8	974	245	43	704

Name residence and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drgs.	Official Gazette. Vol.	Official Gazette. Page.
Gally, Merritt, New York, N. Y. Mechanical musical instrument	380,716	Apr. 10	617	170	43	132
Galstee, Gabriel J. W., New York, N. Y. Cloth-cutting machine	385,050	June 26	1894	468	43	1495
Gamble, James N. (See Stickney, Paul, assignor.)						
Gamble, Joseph W., assignor of one-half to J. McCarney, Adair, Iowa. Draft-evener	380,755	Apr. 10	674	188	43	144
Gamble, Joseph W., and L. M. Ratt, Casey, Iowa. Sickle-grinder	385,176	June 26	1999	518	43	1531
Gauss, Hervey D., Chicago, Ill. Device for operating a set of levers	382,398	May 8	698	160, 161	43	639
Gaster, Edward D., Glasgow, Ky. Lock pin or breech	383,719	May 29	2751	725	43	1077
Gard, William E., Meriden, Conn. Furniture-caster	384,837	June 19	1498	392	43	1432
Gardiner, Stephen H., Lynn, Mass. Fire-escape	384,143	June 5	448	104	43	1237
Gardner, Emmet V. R., West Town, N. Y. Hay or straw grappling fork	384,970	June 26	1681	436, 437	43	1466
Gardner, James C., Chicago, Ill. Extension-ladder	382,871	May 15	1471	388	43	812
Gardner, John A., Calico, N. C. Rice-rake, cotton-chopper, and cultivator	380,883	Apr. 10	875	235	43	179
Gardner, Marshall. (See Stone and Gardner.)						
Gardner, Marshall, assignor of one-half to J. Stone, Aurora, Ill. Box of plastic material	383,175	May 22	1940	509	43	914
Gardner, Rufus, Scotland Neck, N. C. Peanut-planter	381,357	Apr. 17	1583	426	43	337
Gareau, Roch R., assignor of one-half to P. J. Beaubien, Detroit, Mich. Office-indicator	383,393	May 22	2259	600	43	972
Garfield Injector Company. (See Young, Lambert, and Ferris, assignors.)						
Garland, Michael, and A. D. Catlin, Bay City, Mich.; said Catlin assignor to said Garland. Direct-acting steam-engine	382,092	May 1	312	82	43	570
Garland, Milton H., Somerville, Mass. Inkstand	382,698	May 15	1248	326	43	767
Garner, Henry, *et al.* (See Gasking, George H., assignor.)						
Garnier, Emile. (See Lecouteux and Garnier.)						
Garrett, Albert F. M., and F. Frank, Daderille, Ala., assignors to said Garrett. Wrench	382,049	May 15	1756	454	43	887
Garrett, William, and S. T. Wellman, Cleveland, Ohio. Rolling-mill plant	381,689	Apr. 24	2092	545	43	441
Garrett, William H., Geneva, Nebr. Feed-trough	384,357	June 12	781	204	43	1277
Garrison, Charles M., Wichita, Kans. Means for utilising the current force of running water	385,961	June 26	2130	544, 545	43	1530
Garrison, Fred A., Fort Dodge, Iowa. Photographic cabinet	384,754	June 19	1363	357	43	1397
Garrison, Rheuben W., *et al.* (See Pope, James M., assignor.)						
Garsed, Joshua, Philadelphia, Pa. Skein-reel	381,771	Apr. 24	2195	574	43	463
Garsed, Robert P., Norristown, Pa. Track-buffer	380,640	Apr. 10	569	157	43	123
Garsed, Robert P., Norristown, Pa. Pneumatic annunciator	384,144	June 5	448	124	43	1237
Garst, Stephen H., Greenville, Ohio. Manure-distributer	383,639	May 29	2626	695, 696	43	1051
Gärtner, Albert F. (See Gemünden and Gärtner.)						
Gartside, William N., Richmond, Ind. Door-plate and indicator	380,652	Apr. 3	514	144	43	104
Garver, David A., and C. H. Straight, Bryan, Ohio. Tray for wheelbarrows	380,562	Apr. 3	389	111	43	79
Garver, David A., and C. H. Straight, Bryan, Ohio. Wheelbarrow	381,358	Apr. 17	1594	426	43	337
Garver, David A., and C. H. Straight, Bryan, Ohio. Tube and making the same	385,109	June 26	1907	4-6	43	1513
Garvey, Owen F., Pawtucket, R. I. Soldering-pliers	381,544	Apr. 24	1880	496	43	400
Gas Consumers Benefit Company of the United States. (See Jackson, Walter M., assignor.)						
Gas Motoren Fabrik Deutz. (See Otto, Nicolaus A., assignor.)						
Gash, Edgar, Macomb, Ill. Broom-holder	380,390	Apr. 3	19	5	43	6
Gaskill, Harvey F., Lockport, N. Y. Triple-expansion engine	384,250	June 19	618	166, 167	43	1249
Gaskin, Robert, Jr., Portland, New Brunswick, Canada. Machine for truing the teeth of saws	383,720	May 29	2752	725	43	1077
Gasking, George H., assignor to H. Garner and C. M. Dimmick, Newburg, N. Y. Combined whip-socket and rein-holder	381,359	Apr. 17	1595	427	43	337
Gaskins, Thomas, Arcadia, Fla. Car-coupling	382,602	May 8	1105	294	43	730
Gaston, Augustine J., Beloit, Wis. Paint-mill	383,332	May 22	2193	579, 580	43	961
Gates, George W., Oshkosh, Wis. Match-frame	383,721	May 29	2753	725	43	1077
Gates, George W., Oshkosh, Wis. Match press or frame	383,722	May 29	2754	725	43	1077
Gates, Philetus W., Chicago, Ill. Pulverizer	380,432	Apr. 3	179	49, 50	43	37
Gathmann, Louis. (See Wemple, Andrew, assignor.)						
Gatling, Richard J., Hartford, Conn. Apparatus for casting ordnance	380,756	Apr. 10	675	186, 187	43	144
Gault, Alexander, Medford, Minn. Artificial leg	383,569	May 29	2533	609	43	1030
Gauzentes, Charles. (See Spink and Gauzentes.)						
Gavin, George. (See Cromer and Gavin.)						
Gaw, William H. (See Frishmuth, William, assignor.)						
Gayler, Adolph L., New Britain, Conn. Razor	380,387	Apr. 3	123	36	43	26
Gaylord, George B., Providence, R. I., assignor to Florence Machine Company, Florence, Mass. Oil-stove	383,805	May 29	2897	764, 765	43	1103
Gazeley, Frederick, Montreal, Quebec, Canada, assignor to J. J. Drummond, Chicago, Ill. Office-file for letters, papers, &c.	381,360	Apr. 17	1596	427	43	337
Geary, John, Philadelphia, Pa. Electric annunciator	381,772	Apr. 24	2196	574	43	463
Gedge, Burton H., Covington, Ky. Electric railway-signal	382,299	May 8	632	161	43	640
Geesen, Adolph, Beloit, Kans. Attachment for bridles	383,176	May 22	1941	509	43	914
Geis, Michael. (See Leibert, Anthony, assignor.)						
Geltz, William T., Mansfield, Ohio. Cash and package carrier	385,110	June 26	1908	486	43	1513
Gemünden, George A., and A. F. Gärtner, Savannah, Ga. Bung-fastener	381,920	May 1	30	9	43	569
Gendron, Peter, Toledo, Ohio. Upsetting-machine	382,355	May 8	722	182	43	656
Gendron, Peter, Toledo, Ohio. Vehicle-wheel	382,356	May 8	723	182	43	656
Gendron, Peter, Toledo, Ohio. Rolling tires	383,521	May 29	2470	652	43	1017
Gennert, Emil F., Brooklyn, N. Y. Adjustable nipple for incandescent electric lamps	381,921	May 1	31	9	43	569
Gennert, Emil F., and D. N. Gleason, Brooklyn, assignors to E. P. Gleason Manufacturing Company, New York, N. Y. Punch and die	382,357	May 8	724	182, 183	43	656
Gentry, Joshua H., Sheldon, Mo. Hog-trap	383,218	May 22	2001	524	43	936
George, Adam, and W. Kleindinst, Buffalo, N. Y. Water-wheel	384,438	June 19	1498	390	43	1423
Georget, François X., Camden, N. J. Railway-bedding	381,125	Apr. 17	1268	339	43	263
Georgia, Harrison W., Smethport, and E. Andrews, Williamsport, Pa. Device for jointing, dressing, and sharpening saws	382,467	May 8	802	228	43	687
Gerardi, Pascal, et al. (See Odorizzi, Joseph, assignor.)						
Gerber, Henri, assignor to E. Francillon & Co., St. Imier, Switzerland. Watch-case pendant	383,219	May 22	2002	524	43	936
Gere, George H., Fort Plain, N. Y. Device for derailing cars	383,723	May 29	2755	726	43	1077
Germann, John M., New York, N. Y. Spoke-drawer	381,690	Apr. 24	2084	545	43	442
Gersch, Charles H., Chicago, Ill. Cable-covering machine	383,353	May 22	2195	580	43	961
Getty, George G., Adams, Mass. Door-screener	383,794	May 29	2756	726	43	1078
Geyer, William E. (See Bristol and Geyer.)						
Geyser, Jacob, Allegheny, assignor of one-half to C. H. Miller, Pottsville, Pa. Arrow for passing cord through pipe-lines	382,257	May 1	560	141	43	616

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drf.	Official Gazette. Vol.	Official Gazette. Page.
Ghegan, John J., Newark, N. J. Boiler-alarm	383,946	June 5	155	45	43	1150
Ghegan, John J., Newark, N. J. Magneto-electric liquid-level indicator	384,200	June 5	535	146	43	1224
Gibbs, George, Milwaukee, Wis. Interlocking switch and signal	381,773	Apr. 24	2197	575	43	463
Gibson, Charles D. P., New York, N. Y. Plate for storage-batteries	382,356	May 8	726	183	43	657
Gibson, Charles D. P., New York, N. Y. Storage-battery	382,969	May 15	1605	420	43	839
Gibson, Charles D. P., New York, N. Y. Storage-battery plate	383,640	May 29	2631	686	43	1032
Gibson, Jacob H., New York, N. Y. Baby-carriage	381,834	Apr. 24	2302	580	43	482
Gibson, Lucius B., Pueblo, Colo. Motor for street-cars	384,145	June 5	449	134	43	1207
Gibson, Lucius B., Pueblo, Colo. Motor for street-cars	384,146	June 5	451	125	43	1208
Gibson, Lucius B., Pueblo, Colo. Motor for street-cars	384,147	June 5	452	125	43	1208
Gibson, Parish & Company. (See Phelps, Charles H., assignor.)	381,148	June 5	453	125	43	1208
Gibson, Samuel, San Francisco, Cal. Construction of subway-yokes for cable roads	382,969	May 15	1608	420, 421	43	839
Gibson, Samuel, San Francisco, Cal. Cable-railway grip	382,970	May 15	1609	421	43	840
Gifford, Cyrus. (See Necker and Gifford.)						
Gilbert & Bennett Manufacturing Company. (See Dreadul, Paul, assignor.)						
Gilbert, Wallace B. (See Reynolds, John, assignor.)						
Gilchrist, Raymond B., Peoria, Ill. Cork-extractor	384,839	June 19	1500	380	43	1423
Gildea, John, *et al.* (See King, William H., assignor.)						
Gile, Fred H., Alfred, Me. Siphon	384,251	June 12	619	167	43	1249
Giles, Charles K. (See Fenner, Richard E., assignor.)						
Gill, Asher B., Philadelphia, Pa. Check register or tally	384,438	June 12	893	233	43	1299
Gill, James B., San Francisco, Cal. District-telegraph call-box	383,220	May 22	2092	525	43	926
Gill, Richard, W. H. Butler, and S. Smith, Lawrence, Mass. Spinning-frame	380,563	Apr. 3	349	111	43	79
Gill, William E., and R. Segerdahl, assignors to J. F. Wollensak, Chicago, Ill. Electrical needle annunciator	383,727	May 29	2757	726	43	1078
Gillies, Herman, and D. Stern, Meadville, Pa. Alarm-lock	382,971	May 15	1611	421	43	840
Gillespie, James W. (See Battle, John N., assignor.)						
Gillespie, Thomas A. (See McSweeney, Terrence, assignor.)						
Gillet, Charles F., Springfield, Ill. Fence-machine	385,304	June 26	2308	566, 567	43	1572
Gillette, George H., Newark, N. J. Fruit-basket	382,761	May 15	1325	348	43	783
Gillie, William M., Tonawanda, N. Y. Steering apparatus and windlass	380,481	Apr. 3	254	70	43	52
Gilliland, Ezra T. (See Edison and Gilliland.)						
Gilliland, Ezra T., assignor to American Bell Telephone Company, Boston, Mass. Telephone-transmitter	384,201	June 5	536	146	43	1225
Gillis, William, Buckingham, Quebec, Canada. Band-saw mill	384,252	June 12	621	167	43	1249
Gilmore, Isaac C. H., and H. B. Stafford, Oskaloosa, Iowa. Sad-iron	381,006	Apr. 10	1067	263	43	216
Glass, George, Cadillac, Mich. Device for side-dressing saws	384,149	June 5	425	125, 126	43	1208
Glass, H. L. (See Kendrick, William F., assignor.)						
Glatz, Joseph. (See Domeier and Hagemann, assignors.)						
Glazbrook, Charles A. (See Tolhurst, Glazbrook, Philbey, and Lockerbie.)						
Glazier, George P. (See Wood, James P., assignor.)						
Gleason, Duane A. (See Gennert and Gleason.)						
Gleason Manufacturing Company, E. P. (See Gennert and Gleason, assignors.)						
Gleason, William J. (See Jones, Edmund C., assignor.)						
Glidden, Charles W., Lynn, assignor to J. W. Brooks, trustee, Cambridge, Mass. Heeling-machine	382,762	May 15	1326	349	43	783
Glidden, Chase E., *et al.* (See Cuason, Japhet S., assignor.)						
Glidden, Joseph F., *et al.* (See Cuason, Japhet S., assignor.)						
Glidden, Oscar F., assignor, by mesne assignments, to Michigan Washing Machine Company, Grand Rapids, Mich. Washing-machine	383,425	May 22	2309	612	43	981
Glock, Charles C., *et al.* (See Leland, Edwin A., assignor.)						
Glover, Almon B., Birmingham, Conn. Wire-nail machine	383,878	June 5	39	12, 13, 14	43	1129
Glover, Joshua E., *et al.* (See Jarboe and McHale, assignors.)						
Godding, Milon O. (See Godding, Talmai F. and M. O.)						
Godding, Milon O., Monrovia, Cal. Danger-signal for bridges	384,755	June 19	1365	357	43	1397
Godding, Talmai F., Longmont, Colo., and M. O. Godding, Santa Anita, Cal. Hay-rake	383,454	May 29	2349	625	43	995
Goddu, Louis, Winchester, Mass. Car-truck	381,620	Apr. 24	1989	522	43	422
Goddu, Louis, Winchester, assignor to J. W. Brooks, trustee, Cambridge, Mass. Nailing-machine	383,455	May 29	2350	625, 626, 627	43	995
Godley, George F., Philadelphia, Pa. Car-axle lubricator	381,691	Apr. 24	2085	546	43	442
Godwin, John C., Royse City, Tex. Drill	385,111	June 26	1909	487	43	1513
Goetze, George H., Bahner, Mo. Sheaf-carrier	382,603	May 8	1106	284	43	731
Goggans, Daniel P., *et al.* (See Parkston, George W., assignor.)						
Gohen, James A., Huntington, W. Va. Detachable car-seat arm	383,726	May 29	2758	727	43	1078
Goldie, William. (See Durell and Goldie.)	384,904	June 19	1588	413	43	1439
Golding, John F., Chicago, Ill., assignor to Expanded Metal Company, of Missouri. Machine for making slashed metallic screening	381,231	Apr. 17	1407	377, 378	43	289
Golding, John F., and G. B. Darkee, Chicago, Ill., assignors to Expanded Metal Company, of Missouri. Machine for slashing and expanding flat sheet metal to form meshes	381,230	Apr. 17	1405	376	43	289
Goldman, Leon, *et al.* (See Friede, Samuel M., assignor.)						
Goldsmith, Gustavus A. (See Hoffman, Joseph, assignor.)						
Goldsmith, Max S., Cincinnati, Ohio. Burglar-proof safe	380,717	Apr. 10	619	170	43	132
Goldstein, Abraham. (See Bernstein and Goldstein.)						
Gooch, John, Brompton Road, county of Middlesex, England. Shop-front	381,361	Apr. 17	1397	327	43	327
Good, William E., Reading, assignor to Southwark Foundry and Machine Company, Philadelphia, Pa. Compressing or blowing engine	381,876	Apr. 24	2370	616, 617	43	495
Goodale, Stephen L., Saco, Me. Fertilizer	382,604	May 8	1107		43	731
Goode, Joseph T., Point Peter, Ga. Sweep	382,592	May 8	976	246	43	704
Goode, William H. C., assignor of one-half to W. E. Kilborn, Sidney, Ohio. Wheelbarrow	382,593	May 8	977	246	43	704
Goodell Company. (See Oaks, William A. C., assignor.)						
Goodell, Henry, *et al.* (See Kelly, Wallace C., assignor.)						
Goodenough, Frankl'n L., *et al.* (See Heath, Watson A., assignor.)						
Goodfellow, James, New York, N. Y. Appliance for railway-cars	383,456	May 29	2355	627	43	996
Goodfellow, James T. (See Hart and Goodfellow.)						
Goodfellow, James T., Troy, N. Y., assignor to Iron Car Company, Stamford, Conn. Metallic platform for railway-cars	385,177	June 26	2000	513	43	1531

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drf.	Official Gazette. Vol.	Official Gazette. Page.
Goodfellow, John H., Troy, N. Y., assignor to Lamson Store Service Company, Boston, Mass. Store-service apparatus	381,545	Apr. 24	1881	496	43	460
Goodrich, R. Elmer, assignor of one-half to C. B. Bryant, New Haven, Conn. Sheet-metal joint	382,151	May 1	400	105	43	587
Goodsell, Charles H., Poughkeepsie, N. Y. Velocipede	384,150	June 5	456	126	43	1209
Goodwin, Edward F., assignor to E. F. Goodwin, trustee, Taunton, Mass. Lock	383,522	May 29	2471	652	43	1018
Goodwin, Edward F., assignor to E. F. Goodwin, trustee, Taunton, Mass. Tag-holder	383,523	May 29	2473	653	43	1018
Goodwin, George. (See Goodwin, John B. and G.)						
Goodwin, John B., assignor to W. P. Goodwin, Providence, R. I. Folding and swinging gate	381,064	Apr. 10	1157	309	43	233
Goodwin, John B., assignor to W. P. Goodwin, Providence, R. I. Folding and swinging gate	381,065	Apr. 10	1159	309	43	233
Goodwin, John B. and G., assignors to said G. Goodwin and W. P. Goodwin, Providence, R. I. Folding and swinging gate	381,066	Apr. 10	1161	309, 310	43	234
Goodwin, William P. (See Goodwin, John B., assignor.)						
Goodwin, William P. (See Goodwin, John B. and G., assignors.)						
Goodyear, Albert, New Haven, Conn. Harvesting-machine	381,232	Apr. 17	1409	378, 379, 380	43	290
Goodyear, Lewis, Trumansburg, N. Y. Twine guide and cutter	383,120	May 22	1867	488	43	899
Gordian Nut Lock Association. (See Castle, Orlando L., assignor.)						
Gordon, Fred. W., assignor to Gordon, Strobel & Laureau, Philadelphia, Pa. Dust-catcher for blast-furnaces	381,774	Apr. 24	2199	575	43	464
Gordon, John H. (See Storle, Ole O., assignor.)						
Gordon, Strobel & Laureau. (See Gordon, Fred. W., assignor.)						
Gordon, William, Melrose, assignor to A. Fuller, trustee, Boston, Mass. Sole-edge-burnishing machine	381,497	Apr. 17	1804	479	43	368
Gore, Henry A., H. W. Rn Ton, and G. W. Kelley; said Kelley assignor to E. W. Walker, Goshen, Ind. Carpet-sweeper	383,806	May 29	2899	765	43	1104
Gorrell, John B., assignor of two-thirds to W. J. and F. A. Hogue, La Otto, Ind. Windmill	384,756	June 19	1366	358	43	1398
Gorrell, Thomas S., and E. M. Tubbs, Pittsburg, Kans. Hay-press	381,007	Apr. 10	1069	263	43	216
Gorsuch, George W., assignor of one-third to P. H. Bridenbaugh, Martinsburg, Pa. Harrow	381,835	Apr. 24	2303	599	43	482
Gorton, William E., Moline, Ill. Belting-reel frame	382,152	May 1	401	105	43	587
Goss, Lucius, New York, N. Y. Machine for planing stereotype-plates	383,221	May 22	2004	525	43	926
Gostling, Charles R., Whitehall, assignor of one-half to S. B. Wellington, Catasauqua, Pa. Kiln for burning hydraulic cement	384,905	June 19	1589	414	43	1439
Gottschalk, Andrew, Martin's Ferry, Ohio. Collar for lamps	382,605	May 8	1108	285	43	731
Gould, Eugene H., Beverly, Mass. Knife-blade holder	381,333	Apr. 17	1413	340	43	291
Gould, Forrest B., Milford, Mass. Apparatus for photographing by artificial light	384,151	June 5	458	126	43	1209
Gould, John C., Chicago, Ill. Nail-plate feeder	385,112	June 26	1912	487, 488	43	1514
Gould, John D. (See Tisdale, Charles D., assignor.)						
Gould, John H., Philadelphia, Pa. Flexible pipe-coupling	381,008	Apr. 10	1070	264	43	216
Goulden, Samuel, and J. Clarke, Toronto, Ontario, Canada. Burglar-alarm	382,972	May 15	1612	422	43	840
Gowen, William, Wausau, Wis. Automatic offset for saw-mill carriages	383,457	May 29	2356	627	43	997
Gowen, William, Wausau, Wis. Band-saw mill	383,458	May 29	2358	628	43	997
Gowen, William, Wausau, Wis. Band-saw mill	383,459	May 29	2363	628, 629	43	998
Gowen, William, Wausau, Wis. Offsetting mechanism for saw-mill carriages	383,460	May 29	2365	629	43	998
Gowen, William, Wausau, Wis. Saw-mill	383,461	May 29	2366	629, 630	43	999
Grabler, Peter, St. Louis, Mo. Drill-socket	383,280	May 22	2110	557	43	945
Grabler, Peter, St. Louis, Mo. Screw-cutting die and stock	383,354	May 22	2197	580	43	962
Gräbner, Johann C., Kupferhammer, and H. Rupertl, Brackwede, assignors to K. & Th. Möller, Kupferhammer, Prussia, Germany. Steam-engine	385,113	June 26	1915	488	43	1514
Grace, Henry S., assignor of one-half to C. W. Decker, San Francisco, Cal. Hand-piece for dental engines	380,433	Apr. 3	181	50	43	37
Graeff, Friedrich, Alkmaar, Holland. Producing dried extract of rennet	384,358	June 12	782	.....	43	1277
Grafstrom, Edward. (See Harrington and Grafstrom.)						
Graham, George H. (See Crealman, John A., assignor.)						
Graham, James, Detroit, Mich. Combined pencil-rack and eyeglass-hook	381,692	Apr. 24	2087	546	43	442
Graham, James A., Milwaukee, Wis., assignor to Milwaukee Harvester Company. Grain-binder	383,462	May 29	2368	630	43	1000
Graham, John, Barnesbury, county of Middlesex, England. Apparatus for receiving tickets from ticket printing or numbering machines	381,196	Apr. 17	1269	339, 340	43	264
Graham, John C. (See Pearson, Fred, assignor.)						
Graham, John M., assignor to himself, S. C., M., and T. C. L. Graham, Pittsburg, Pa. Telephone-transmitter	381,234	Apr. 17	1414	381	43	291
Graham, Martha, *et al.* (See Graham, John M., assignor.)						
Graham, Oliver J., Spokane Falls, Wash. Ter. Washing-machine	381,302	Apr. 17	1599	428	43	398
Graham, Sarah C., *et al.* (See Graham, John M., assignor.)						
Graham, Thomas C. L., *et al.* (See Graham, John M., assignor.)						
Grange, William. (See Smith, Orren M., assignor.)						
Granger, Alson M., Glenwood, Mass., assignor to Volker & Felthousen Manufacturing Company, Buffalo, N. Y. Valve	382,594	May 8	978	246	43	704
Grant, John, Beverly, Mass. Fire-escape	383,570	May 29	2534	660	43	1030
Grant, Joseph A. (See Drew and Grant.)						
Granville, Bernard, Chicago, Ill. Type-writing machine	382,036	May 1	242	62, 63	43	558
Graesler, William F., assignor of three-fourths to W. G. Elliot, Williamsport, Pa. Automatic pipe-coupling for railway-cars	383,288	May 22	2108	557	43	945
Gravit, William, Elkhart, Ind. Mechanism for operating derailing switches and semaphores	383,947	June 5	156	46	43	1150
Gray, Carroll E. Waukesha, Wis. Draft-regulator	382,699	May 15	1249	326	43	767
Gray, Charles W., *et al.* (See Broyles, George E., assignor.)						
Gray, George, New York, N. Y. Mulled frame for school-slates	381,363	Apr. 17	1600	428	43	398
Gray, William. (See Baines, Charles, assignor.)						
Graydon Dynamite Projectile Cartridge and High Explosive Company. (See Graydon, James W. assignor.)						
Graydon, James W., assignor, by mesne assignments, to Graydon Dynamite Projectile Cartridge and High Explosive Company, Washington, D. C. Shell for explosives	382,223	May 1	502	130	43	606
Graydon, James W., assignor, by mesne assignments, to Graydon Dynamite Projectile Cartridge and High Explosive Company, Washington, D. C. Shell	382,226	May 1	508	131	43	607
Graydon, James W., assignor, by mesne assignments, to Graydon Dynamite Projectile Cartridge and High Explosive Company, Washington, D. C. Contact-fuse for projectiles	382,227	May 1	511	131	43	607

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drgs.	Official Gazette. Vol.	Official Gazette. Page.

Hackaley, John, *et al.* (See Hackaley, William, assignor.)						
Hackaley, William, assignor of two-thirds to J. Hackaley and J. P. Hillard, Fall River, Mass. Spinning-mule	381,089	Apr. 10	1169	311	43	236
Hackett, John, *et al.* (See Griffin, Patrick, assignor.)						
Hackett, John C., St. Louis, Mo. Hame-fastener	383,727	May 29	2759	727	43	1078
Haddock, Worcester, assignor of one-half to Sillie & Dahlmeier, Cincinnati, Ohio. Machine for cutting moldings	380,434	Apr. 3	183	50, 51	43	97
Haddow, William, Newton, Mass. Planer-gage and caliper	380,797	Apr. 10	745	204	43	157
Hadfield, Joseph, New York, and F. McConnell, Brooklyn, N. Y. Soil-pipe ventilator	385,302	June 26	2187	545	43	1539
Hadley, Charles F., Chicopee, assignor to Overman Wheel Company, Boston, Mass. Bicycle	380,686	Apr. 10	878	236	43	180
Hadley, Ethan, Chicopee Falls, assignor to Dover Stamping Company, Boston, Mass. Egg-beater	380,564	Apr. 3	391	118	43	89
Hagar, Benjamin R., Bradford, Pa. Wrench	384,975	May 15	1616	423	43	841
Hagemann, Randolph F., D. Noggle, and R. S. Eads, New Madison, Ohio. Corn-shuck compressor	383,355	May 22	2196	581	43	988
Hagemann, Otto C. (See Domeier and Hagemann.)						
Hager, Charles, assignor of one-half to H Berthig, Buffalo, N. Y. Freight-car door	382,154	May 1	404	106	43	568
Hager, Henry D. (See Blasier, David J. assignor.)						
Hagerty, Thomas F., San Francisco, Cal. Button-hole sewing-machine	382,762	May 15	1398	349	43	793
Hagg, William L., Lansing, Mich. Machine for splicing wire	383,178	May 22	1942	509	43	914
Haggenmiller, Louis and O., Philadelphia, Pa. Apparatus for pitching barrels	385,178	June 26	2003	513	43	1538
Haggenmiller, Otto. (See Haggenmiller, Louis and O.)						
Hahn, Albert K. (See Circle, Franklin P., assignor.)						
Hahn, Isaac H., New York, N. Y. Automatic car-alarm operator	383,524	May 29	2474	653	43	1018
Haines, Byron W., San Francisco, Cal. Dental plugger	381,364	Apr. 17	1601	428	43	328
Haines, John H. J., Flushing, N. Y. Attachment for filling cans	381,236	Apr. 17	1422	382	43	298
Haines, Samuel A., Guide, Tex. Mechanical motor	382,525	May 8	979	247	43	705
Hairgrove, George W. (See Irwin and Hairgrove.)						
Haischer, Victor, *et al.* (See Stasch, Emil R., assignor.)						
Haish, Jacob, De Kalb, Ill. End-gate	380,483	Apr. 3	256	71	43	33
Haish, Jacob, De Kalb, Ill. Wagon-bolster	384,619	June 19	1164	308	43	1358
Haish, Jacob, De Kalb, Ill. Railway-truck	384,620	June 19	1165	308	43	1359
Hake, Cecil N. (See Dupré and Hake.)						
Hake, Samuel E., Youngstown, Ohio. Cotton-seed planter	384,314	June 12	706	{186 189	43	1265
Hale, Henry S., Philadelphia, Pa. Car-seat	384,153	June 5	461	127	43	1210
Hale, James W., Newburyport, Mass. Mechanical toy	381,992	May 1	32	9	43	540
Haley, Thomas, Boston, Mass. Hose or pipe coupling	382,488	May 8	895	228	43	698
Hall, Arthur H., Chicago, Ill. Map-case	384,259	June 12	621	168	43	1250
Hall & Co., B. L. (See Lewis, Russell H., assignor.)						
Hall, Edward H., *et al.* (See Temme, Louis N., assignor.)						
Hall, Frederick C., Chicago, Ill. Buckle	383,121	May 22	1808	486	43	889
Hall, George. (See Dillon, William S. F., assignor.)						
Hall, George F., Boston, Mass., assignor to Nonantum Worsted Company, of Massachusetts. Reel-support	381,198	Apr. 17	1271	340	43	264
Hall, George F., New York, N. Y., assignor of one-half to P. Lowentrast, Newark, N. J. Rocking-chair	383,898	May 29	2901	{765 766	43	1164
Hall, Henry, assignor to Rensselaer Manufacturing Company, Lansingburg, N. Y. Straight-way stop-valve	384,986	June 19	1500	414	43	1439
Hall, Jay E., Swanton, Ohio. Tension device for rope transmission	384,360	June 12	785	205	43	1276
Hall, John D., Philadelphia, Pa. Wash-stand	381,621	Apr. 24	1991	{522 523	43	422
Hall, John E. (See Bridenthal, Hezekiah, assignor.)						
Hall, Samuel G., Cohoes, N. Y. Circular-knitting machine	384,621	June 19	1168	{308 309	43	1359
Hall, Zachary T., Philadelphia, Pa. Mug	385,179	June 26	2004	514	43	1538
Halladay Manufacturing Company, William H. (See Halladay, William H., assignor.)						
Halladay, William H., assignor to W. H. Halladay Manufacturing Company, Chicago, Ill. Saw-sharpening machine	381,775	Apr. 24	2200	576	43	464
Hallida, James G., Waterbury, Conn., assignor to S. E. May, New York, N. Y. Lamp	381,009	Apr. 10	1071	284	43	216
Hallidie, Andrew S., San Francisco, Cal. Wire-rope-making machine	381,365	Apr. 17	1604	429	43	329
Hallock, John K. (See Blickensderfer and Hallock.)						
Hallowes, James M., New York, N. Y. Car-axle box	383,738	May 29	2760	727	43	1078
Halsey, William S., Bridgeport, Conn. Machine for cutting the threads on bolts	380,887	Apr. 10	880	{236 237	43	180
Haltenan, Jacob. (See Rein, Burnard, assignor.)						
Halter, Leander. (See Rine and Halter.)						
Hamaker, David L., Chambersburg, Pa. Bolting-reel	384,520	June 12	1021	266	43	1323
Hambien, Rodney F. (See Hooper and Hambien.)						
Hambleton, Francis H., Baltimore, Md. Gas-pressure-governing apparatus	380,565	Apr. 3	391	112	43	89
Hamblin, Robert E., *et al.* (See Newsom and Oxley, assignors.)						
Hamblin, Silvanus and S. M., assignors to E. S. Douglass, Plymouth, and H. Sawyer, Boston, Mass. Loom picking mechanism	384,622	June 19	1175	310	43	1360
Hamblin, Stephen M. (See Hamblin, Silvanus and S. M.)						
Hamblin, Stephen M., Plymouth, Mass. Picker-stick for looms	382,645	May 8	1163	299	43	742
Hambruch, Heinrich F., assignor to A. F. Richter, Hamburg, Germany. Detachable button or stud	383,052	May 15	1759	454	43	868
Hamilton, Edward M. and J. Q., Russell's Place, Ohio. Car-coupling	384,840	June 19	1502	391	43	1423
Hamilton, John Q. (See Hamilton, Edward M. and J. Q.)						
Hamilton, Jonathan E., assignor of one-half to L. R. Palmer, Minneapolis, Minn. Apparatus for cooling or warming the rectum or vagina	380,696	Apr. 3	477	135	42	97
Hamilton, Joseph B., Springfield, Mass. Electro-magnetic separator	384,035	June 5	285	81	43	1176
Hamlet, David B., Bristol, Ind. Wagon and carriage lifter	382,700	May 15	1351	327	43	768
Hamlin, Mary J., Bartramville, Ohio. Clamp for fruit-cans	384,361	June 12	786	205	43	1278
Hammelrath, John M. (See Schumpe, Friedrich, assignor.)						
Hammer, Thorvald F. (See Lindner and Hammer.)						
Hammer, Thorvald F., Branford, Conn. Machine for tapping pipe-elbows	382,606	May 8	1160	285	43	731
Hammett, Hiram G., Troy, N. Y. Packing for balanced valves	382,300	May 8	633	161	43	649
Hammond, George W., Boston, Mass. Apparatus for canesticising soda, &c.	381,986	May 1	167	43	43	545
Hammond, Henry, Charlton, Mass. Fruit picker	382,764	May 15	1330	349	43	793

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drgs.	Official Gazette. Vol.	Official Gazette. Page.
Hampton, Robert I., Athens, Ga. Railway-ticket	380,566	Apr. 3	394	112, 113	43	81
Hampton, Thomas, and J. Facer, Barrow-in-Furness, county of Lancaster, England, assignors of one-third to P. S. Justice & Co., Philadelphia, Pa., and London, England. Mold for casting ingots	380,331	Apr. 3	20	6	43	6
Hand Power Test Machine Company. (See Mosser, Ferdinand, assignor.)						
Hanes, George W. (See Rand, Jefferson C., assignor.)						
Haney, John Q. A. (See Mitzel and Haney.)						
Hanford, Clarence C., Medford, Mass. Making malt liquors	382,155	May 1	406	106	43	569
Hanford, Clarence C., Medford, Mass. Apparatus for cooling liquids	382,156	May 1	407	106	43	569
Hänisch, Emil, and M. Schroeder, Hamborn, Prussia, Germany. Producing sulphuric anhydride	384,841	June 19	1503	391	43	1424
Hankin, William, Sr., Brooklyn, N. Y. Buck-saw-brace	380,567	Apr. 3	395	113	43	81
Hanks, Austin J., Wilmington, Ohio. Wheel	384,759	June 19	1372	359	43	1399
Hanly, Thomas F., assignor to F. A. Behan, New Orleans, La. Passenger-register	384,572	June 12	1095	287, 288	43	1337
Hanmore, Hiram M., Camden, N. J. Fire-kindler	381,237	Apr. 17	1423	382	43	892
Hanrez, Prosper, Brussels, Belgium. Steam-boiler	384,972	June 26	1685	438	43	1467
Hanscom, William W., San Francisco, Cal. Steam-actuated valve	380,868	Apr. 10	887	237, 238	43	189
Hansen, Alfred M., Fulton, Ill. Facing for walls of buildings	382,359	May 8	728	193	43	657
Hansen, Andrew, assignor of one-third to C. P. Jorgensen, Racine, Wis. Brake-lock	381,010	Apr. 10	1072	284	43	216
Hansen, Peder, Chicago, Ill. Tank-supply-regulating valve	382,301	May 8	634	161	43	646
Hansen, Sigvart, Bohn, assignor to C. Christophersen, Christiania, Norway. Horseshoe-nail machine	382,646	May 8	1163	300, 301	43	749
Hapgood Plow Company. (See Neff, Joseph B., assignor.)						
Harnain, Matthew, *et al.* (See Odorizzi, Joseph, assignor.)						
Harbert, William S., *et al.* (See Jewell, Crews, assignor.)						
Harbison, James, Schenectady, N. Y. Harness-bracket	381,776	Apr. 24	2202	576	43	464
Harcourt, Stillwell R., assignor to W. W. Kimball Company, Chicago, Ill. Piano-action	381,129	Apr. 17	1272	340	43	264
Harcourt, Stillwell R., assignor to W. W. Kimball Company, Chicago, Ill. Piano-forte action	384,254	June 12	623	166	43	1250
Harden, Albert, East Bridgewater, Mass., assignor of one-half to S. A. West, St. Louis, Mo. Shank-burnishing device	384,204	June 5	540	142	43	1226
Hardenbergh, Charles M., Minneapolis, Minn. Dust-collector	384,573	June 12	1096	288	43	1337
Hardenstein, A. O. (See Swafford and Burns, assignors.)	385,363	June 26	2138	545	43	1560
Harding, August, Oakland, Cal. Electric-arc lamp	380,435	Apr. 3	186	51, 52	43	38
Hardinge, Harry W., Leadville, Colo. Electric tele-thermoscope	382,976	May 15	1617	424	43	841
Hardwick, Harry, Philadelphia, Pa. Carpet fabric	382,157	May 1	409	107	43	569
Hardwicke, James K., and J. J. Redmon, Marshall, N. C. Apparatus for coloring tobacco	382,084	May 1	316	83	43	571
Hardy, John J., assignor to himself, L. W. Hardy, Lake View, J. A. Yale, J. E. Young, and D. L. Hough, Chicago, Ill. Universal table for drills	380,322	Apr. 3	23	6	43	7
Hardy, Lewis W., *et al.* (See Hardy, John J., assignor.)	381,130	Apr. 17	1273	341	43	265
Hardy, Moses F., Remsen, N. Y. Invalid-bedstead	382,872	May 15	1472	386	43	813
Harles, William, St. Louis, Mo. Fire-lighter	384,642	June 19	1504	391	43	1424
Harman, William, Oak Park, Ill. Bridge	383,880	June 5	42	14, 15	43	1129
Harmel, Albert, assignor to Société Harmel Frères, Val-des-Bois, near Warmeriville, France. Apparatus for dyeing	382,977	May 15	1619	423, 424	43	841
Harmon, Charles H., assignor to himself and W. H. Reed, Lebanon, Oreg. Oven attachment	381,470	Apr. 17	1764	471	43	359
Harmon, Eleazer, Baltimore, Md. Alarm-bolt for doors	384,760	June 19	1373	359, 360	43	1399
Harmon, Eleazer, Baltimore, Md. Alarm-bolt	384,761	June 19	1374	360	43	1399
Harmon, Legrand B., Caryaville, and J. N. Nutt, Sidney, Ohio. Fence-post	380,627	Apr. 3	478	135	43	97
Harmony, William P., Sidney, Ohio. Type-case stand	383,292	May 22	2114	558	43	946
Harness, Cornelius B., London, England. Electric belt	380,568	Apr. 3	396	113	43	81
Harper, Albertus V., Tower Hill, Ill. Fence-machine	382,596	May 8	981	247	43	705
Harper, Joseph H., *et al.* (See Elliott, Robert C., assignor.)						
Harpham, Julius C., Lincoln, Nebr. Rosette attachment for bridles	383,122	May 22	1868	498	43	899
Harrigan, Dennis, Somerville, Mass. Letter-box	384,154	June 5	464	127	43	1210
Harrington, Daniel, and M. A. Keane, New Brunswick, N. J. Combined tie, chair, and fish-plate	381,238	Apr. 17	1424	383	43	892
Harrington, Patrick S., Cheyenne, Wyo. Ter., assignor to Cheyenne Manufacturing Company, of Wyoming. Whip	382,258	May 1	561	141	43	617
Harrington, Randall A., Providence, R. I. Inclined railway and water-tobogganing apparatus	384,843	June 19	1506	391, 392	43	1424
Harrington & Richardson Arms Company. (See Caldwell, Homer M., assignor.)						
Harrington, Samuel H., Columbus, Ohio. Device for extinguishing fires and preventing the escape of steam in railway-cars	381,924	May 1	35	10	43	521
Harrington, Samuel H., and E. Grafstrom, Columbus, Ohio. Device for extinguishing fires in railway-cars	381,923	May 1	33	10	43	521
Harris, Benjamin G. (See Fairman, Simon, assignor.)						
Harris Button Hole Attachment Company. (See Williams, Henry J., assignor.)						
Harris, Carleton C., Rochester, N. Y. Fabric-turfing implement	381,997	May 1	170	44	43	545
Harris, Enoch, Evansville, Ind. Saw-tooth	381,011	Apr. 10	1073	285	43	217
Harris, George F., New York, N. Y. Laying railway-track	381,366	Apr. 17	1606	429, 430	43	329
Harris, James, Columbia, Mo. Fence	382,806	May 15	1390	365	43	795
Harris, James C. (See Burton, Augustus G., assignor.)						
Harris, John E., *et al.* (See Class, William F., assignor.)						
Harris, Lorenzo H., Aurora, Ill. Car-coupling	383,729	May 29	2760	728	43	1078
Harris, Morris C., San José, Cal. Printer's rule-case	382,038	May 1	247	63, 64	43	559
Harris, Noah, assignor of one-half to H. W. Porter and C. M. Griffith, Vincennes, Ind. Axle-washer	382,250	May 1	562	142	43	617
Harris, Rozell, Hackensack, N. J. Wagon-jack	382,807	May 15	1391	365	43	795
Harrison John, Winchester, county of Hants, England. Crank for velocipedes	381,547	Apr. 24	1884	497	43	401
Harrison, John G., 11 Noel Road, Edgbaston, England. Manufacture of axles for vehicles	384,521	June 12	1022	266, 267	43	1323
Harrison, John O. (See Harrison, William D., assignor.)						
Harrison, Thomas W., Topeka, Kans. Bag-lock	384,668	June 19	1371	333	43	1379
Harrison, William D., Pine Bluff, Ark., assignor of one-fourth to J. O. Harrison. Box lid	385,305	June 26	2211	567	43	1573
Hart, Anselem G., Chicago, Ill. Cigar-vending apparatus	381,239	Apr. 17	1425	383	43	892
Hart Emery Wheel Company. (See Rogers, Samuel C., assignor.) (Reissue.)						
Hart, Hubert C., Unionville, Conn. Caster-frame	383,595	May 29	2475	653	43	1018

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drgs.	Official Gazette. Vol.	Official Gazette. Page.
Hart, Thomas J., Detroit, Mich., assignor to E. G. Felthousen and C. A. Sherwood, Buffalo, N. Y. Lubricator	382,978	May 15	1623	424	43	842
Hart, William H., Brooklyn, and J. T. Goodfellow, Troy, N. Y., assignors to W. H. Johnstone, Philadelphia, Pa. System of electrical distribution	380,757	Apr. 10	677	188, 189	43	145
Hartman, John, Jr., Philadelphia, Pa. Sash-holder	381,131	Apr. 17	1274	341	43	265
Hartman, Samuel M., Reading, Pa. Trace-eye protector	383,526	May 29	2476	654	43	1019
Hartman, William M., Denver, Colo. Combined concentrator and amalgamator	382,701	May 15	1251	327	43	768
Hartness, James, assignor to Union Hardware Company, Torrington, Conn. Lock	384,441	June 12	895	234	43	1300
Harvey, Hayward A., Orange, N. J. Screw-swaging machine	383,949	June 5	158	46, 47	43	1151
Harvey, Thomas W., Orange, N. J. Portable photographic developing-box	385,264	June 26	2139	545	43	1560
Harwood, Alphranso A., McKeesport, Pa. Oil-furnace	383,123	May 22	1869	488, 489	43	899
Harwood, Herbert J., Littleton, assignor to Harwood Manufacturing Company, Boston, Mass. Folding chair	381,367	Apr. 17	1608	430	43	330
Harwood Manufacturing Company. (See Harwood, Herbert J., assignor.)

Hunter, Rudolph M., assignor to Electric Car Company of America, Philadelphia, Pa. Electric railway	381,555	Apr. 24	1891	499	43	463
Hunter, Rudolph M., assignor to Electric Car Company of America, Philadelphia, Pa. Electric railway	381,556	Apr. 24	1894	499	43	463
Hunter, Rudolph M., assignor to Electric Car Company of America, Philadelphia, Pa. Electric railway	382,876	May 15	1479	388	43	814
Hunter, Rudolph M., assignor to Electric Car Company of America, Philadelphia, Pa. Electric railway	384,576	June 12	1099	269	43	1338
Hunter, Rudolph M., assignor to Electric Car Company of America, Philadelphia, Pa. Electric railway	384,909	June 19	1594	415	43	1440
Hunter, Rudolph M., Philadelphia, Pa., assignor to Electric Car Company of America, of Pennsylvania. Manufacture of secondary batteries	385,053	June 26	1827	469	43	1496
Hunter, Rudolph M., Philadelphia, Pa., assignor to Taylor Metallic Railway Tie Company, of New Jersey. Railway	383,575	May 29	2539	670	43	1032
Huntley, William W., Silver Creek, N. Y. Rudder	382,476	May 8	897	229	43	688
Huntly, Maurice, Philadelphia, Pa. Truck	381,786	Apr. 24	2217	580	43	467
Hunzinger, George, New York, N. Y. Chair	385,181	June 26	2006	514	43	1532
Hurd, Dexter N., Kokomo, Ind. Circular saw	380,628	Apr. 3	480	135	43	98
Hurley, Simon J., assignor of one-half to P. McDermott, New Haven, Conn. Horseshoe-pillers	384,979	June 26	1693	440	43	1469
Huson, Winfield S., Taunton, Mass., assignor to Campbell Printing Press and Manufacturing Company, New York, N. Y. Ratchet-movement	382,263	May 1	566	143	43	617
Husselman, Samuel B., Chicago, Ill. Iron fence	383,054	May 15	1760	455	43	998
Hussey, Everett, Hudson, Mass. Portable folding hammock-stand	383,296	May 22	2119	559	43	947
Huston, Winfield S., Fayette County, Ohio. Flood-gate	382,642	May 8	1172	303	43	744
Hutchins, George F., assignor to Knowles Loom Works, Worcester, Mass. Let-off mechanism for looms	380,653	Apr. 3	516	144	43	105
Hutchins, George F., assignor to Knowles Loom Works, Worcester, Mass. Planer attachment for cutting internal gears	381,787	Apr. 24	2218	581	43	467
Hutchins, George F., assignor to Knowles Loom Works, Worcester, Mass. Clutch-coupling	381,788	Apr. 24	2219	581	43	467
Hutchinson, John B., Penn's Grove, N. J. Wagon-standard	383,297	May 22	2120	559	43	948
Hutchinson, Stephen G., Columbus, Ohio. Pile	383,055	May 15	1761	455	43	998
Hutchinson, William A. (See Pugh, Cortes V., assignor.)	383,884	June 5	51	16	43	1131
Huth, John A., Bayard, Ohio. Portable crane	382,307	May 8	640	163	43	641
Hutton & Company, J. M. (See Torbeck, William H., assignor.)						
Hutton, John, New Utrecht, assignor of one-half to J. W. Fowler, Brooklyn, N. Y. Car-ventilator	380,440	Apr. 3	196	54	43	40
Huyck, Francis P. (See Baker and Huyck.)						
Hyatt, Frank A., and E. D. Tankersley, Alamosa, Colo. Manacle	380,441	Apr. 3	197	54	43	40
Hyatt, John W., Newark, N. J. Porous filter-cup	382,649	May 8	1173	303	43	744
Hyatt, John W., Newark, N. J. Anti-friction journal-bearing	385,286	June 26	2149	547	43	1502
Hyatt, John W., Newark, N. J. Anti-friction journal-bearing	385,287	June 26	2150	548	43	1502

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drfs.	Official Gazette. Vol.	Official Gazette. Page.
Hyatt School Slate Company. (See Knauss, George L., assignor.)						
Hyde, Frank, Sioux Falls, Dak. Ter. Ruby-pin setter	381,603	June 19	1290	337	43	1398
Ide, Albert L., Springfield, Ill. Steam-engine indicator. (Reissue)	10,918	Apr. 3	551	151	43	111
Illingworth, John, Newark, N. J. Ingot-forming apparatus	382,497	May 8	822	210 / 211	43	675
Illston, George, assignor to Royal Machine Manufacturing Company, (limited,) Birmingham, county of Warwick, England. Velocipede	383,306	May 22	2262	601 / 602	43	972
Imbach, Martin G., Brooklyn, assignor to Improved Horse Shoe Company, New York, N. Y. Mold	383,885	June 5	52	17	43	1131
Immisch, Moritz, London, county of Middlesex, England. Dynamo-electric machine and motor	381,789	Apr. 24	2221	581 / 582	43	468
Improved Horse Shoe Company. (See Imbach, Martin G., assignor.)						
Ingalls, Asa H., Hanover Centre, N. H. Insect-destroyer	381,377	Apr. 17	1623	433	43	338
Ingalls, Charles L., assignor of one-half to G. F. Blair, Lowell, Mass. Lamp-chimney	380,891	Apr. 10	750	205	43	157
Ingersoll, Simon, Glenbrook, Conn. Rock-drill	381,838	Apr. 24	2209	600	43	483
Ingleton, Edward, Toronto, Ontario, Canada. Steam plowing apparatus	382,963	May 15	1698	496	43	842
Ingraham, Nathan D. (See Clark and Ingraham.)						
Ingram, J. C. (See Jefferis and Thurman, assignors.)						
Inslinger, Alfred, assignor to W. P. Uhlinger, Philadelphia, Pa. Machine for winding spools, &c	384,446	June 12	904	235	43	1301
Insull, Samuel. (See Estes, Edwin G., assignor.)						
International Electric Company. (See Watson, John E., assignor.)						
International Fastening Company. (See Kruetzer, Edwin J., assignor.)						
International Fastening Company. (See Mead, Albert G., assignor.)						
Ireland, David M. (See Matthews and Ireland.)						
Iron Car Company. (See Goodfellow, James T., assignor.)						
Irvine, Albert C., assignor to W. Smith, Boston, Mass. Metal-cutter	384,694	June 19	1291	337	43	1398
Irwin, Hall M., Hanford, Cal. Gang-plow	380,895	Apr. 10	898	240	43	184
Irwin, William H., and G. W. Hairgrove, Wilderville, Tex. Cotton-cultivator	382,162	May 1	417	109	43	580
Isbell, Arista H., Asheville, N. C. Memorandum-calendar	384,536	June 12	1020	269	43	1334
Israel, David. (See Ferrell and Israel.)						
Isenhuth, Charles C., Huron, Dak. Ter. Four-horse evener	384,167	June 5	485	133	43	1215
Ithaca Gun Co. (See Smith, Leroy H., assignor.)						
Ivers, Alfred, New York, N. Y. Water-closet hopper and bowl	382,089	May 1	323	84	43	578
Ivers & Pond Piano Company. (See Ivers, William H., assignor.)						
Ivers, William H., Dedham, assignor to Ivers & Pond Piano Company, Boston, Mass. Piano-key bottom	382,471	May 8	899	229	43	689
Ives, Benjamin, Chicago, Ill. Vest-protector	380,576	Apr. 3	410	117	43	83
Ivory, James W., Philadelphia, Pa. Combined rubber-dam clamp and napkin-holder	384,577	June 12	1101	269	43	1338
Ivory, James W., Philadelphia, Pa. Rubber-dam adjuster and clamp	384,578	June 12	1102	269	43	1338
Ivory, John C., Somerville, Mass. Manufacture of boots or shoes	382,878	May 15	1487	389	43	817
Jaccard, Eugène F., Ste. Croix, Switzerland. Music-box	382,879	May 15	1488	389 / 390	43	817
Jackson, Amos H., Fremont, Ohio. Bustle	384,850	June 19	1517	395	43	1426
Jackson, Isaac, Kingman, Kans. Check-row attachment for planters	382,628	May 8	894	211	43	676
Jackson, John, Clinton, Iowa. Sash-fastener	383,886	June 5	54	17	43	1131
Jackson, John, Springfield Gravelly Hill, near Birmingham, county of Warwick, assignor to P. A. Martin, Birmingham, England. Spring-wire band	381,017	Apr. 10	1060	286	43	210
Jackson, Peter H., San Francisco, Cal. Floor, roof, or area covering. (Reissue)	10,921	Apr. 10	1222	328	43	946
Jackson, Walter M., New York, N. Y. Gas-burner	381,378	Apr. 17	1623	433	43	338
Jackson, Walter M., New York, N. Y. Mechanism for utilizing and controlling hydro-dynamic forces	383,887	June 5	55	18	43	1131
Jackson, Walter M., New York, N. Y. Heat developer and radiator	381,365	June 12	794	207	43	1279
Jackson, Walter M., New York, N. Y. Marine propulsion	385,182	June 26	2007	515	43	1533
Jackson, Walter M., New York, N. Y. Marine propulsion	385,183	June 26	2011	515	43	1534
Jackson, Walter M., New York, N. Y. Marine propulsion	385,184	June 26	2013	516	43	1534
Jackson, Walter M., assignor to Gas Consumers Benefit Company of the United States, New York, N. Y. Gas-burner	380,802	Apr. 10	751	206		157
Jackson, Walter M., assignor to Gas Consumers Benefit Company of the United States, New York, N. Y. Regulator for gas-burners	380,803	Apr. 10	752	206	43	158
Jackson, Walter M., assignor to Gas Consumers Benefit Company of the United States, New York, N. Y. Burner-tip	381,379	Apr. 17	1625	433	43	338
Jackson, Walter M., assignor to Gas Consumers Benefit Company of the United States New York, N. Y. Gas-tip and pillar	381,380	Apr. 17	1626	433	43	338
Jacobs, Jacob, New York, N. Y. Illuminating-tile	385,268	June 26	2152	548	43	1502
Jacobs, Jacob, New York, N. Y. Illuminating-tile	385,269	June 26	2153	548 / 549	43	1502
Jacobs, Jacob, New York, N. Y. Illuminating-tile and roofing-plate	385,270	June 26	2154	549 / 550	43	1503
Jacobs, Jacob, New York, N. Y. Illuminating tile, side wall, &c	385,271	June 26	2155	550	43	1503
Jacobs, William E., Columbus, Ohio. Harrow	383,298	May 22	2121	559 / 560	43	948
Jacques, Joseph R., Hancock, Mich. Lasting-tool	382,429	May 8	826	212	43	676
Jacques, William W., Newton, Mass., assignor to Edison Phonograph Toy Manufacturing Company, of Maine. Combined doll and phonograph	383,299	May 22	2123	560	43	948
Jahn, Frederick G. (See Grovesteen and Jahn.)						
James, David B., Visalia, Cal. Traction-engine	383,179	May 22	1943	510	43	915
James, George C., Cincinnati, Ohio. Machine-gage	380,683	Apr. 10	576	158	43	125
James, Lindorf H., Vanceburg, Ky. Churn	382,162	May 1	418	110	43	580
James, William, Port Pirie, South Australia. Combined buckle and spring-hook	382,164	May 1	419	110	43	580
Jamieson, Augustus, Elizabeth, N. J., assignor of one-half to W. A. Lottimer, New York, N. Y. Pulverizer	382,364	May 8	735	185 / 186	43	656
Jamieson, James A., Montreal, Quebec, Canada. Weight-recorder for weighing-scales	385,310	June 26	2216	568	43	1571
Jamieson, James A., assignor of one-fourth to F. and J. B. Caverhill, Montreal, Quebec, Canada. Safety appliance for railway-cars	380,630	Apr. 3	481	136	43	78
Janney, Morris P., Easton, Pa. Boiler-feeding attachment	383,227	May 22	2012	528	43	928
Jarboe, Charles S., and J. McHale, Terre Haute; said McHale assignor to A. H. Tuesh and J. E. Glover, Vigo County, Ind. Hydrocarbon-burner	383,888	June 5	58	18	43	1132
Jarvis, Joseph C., Huntington, W. Va. Rotary engine	383,530	May 29	2485	655 / 656	43	1020
Jarvis, Samuel E., Lansing, Mich. Steam-engine	380,492	Apr. 3	264	73	43	54
Jefferis, Albin L., and W. C. Thurman, assignors of one-fourth to J. C. Ingram, Lincoln, Cal. Rotary engine	380,489	Apr. 3	266	73	43	55

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drs.	Official Gazette. Vol.	Official Gazette. Page.
Jefferson, John T., assignor of one-half to G. Wells, Annapolis, Md. Loading apparatus for ordnance-cartridges	384,039	June 5	295	82, 83	43	1177
Jeffery, Frank M., Jersey City, N. J. Spring bed or bed-bottom	385,118	June 26	1921	490, 491	43	1516
Jeffery, Henry, assignor to S. Fox & Co., (limited,) Stocksbridge Works, near Sheffield, county of York, England. Umbrella	381,139	Apr. 17	1293	343	43	999
Jeffery, Thomas B., Ravenswood, Ill. Vehicle-wheel	383,129	May 22	1877	490	43	901
Jeffery, Thomas B., Ravenswood, Ill. Vehicle-wheel	383,130	May 22	1878	490	43	901
Jeffery, Thomas B., Ravenswood, Ill. Velocipede	383,131	May 22	1880	491	43	999
Jeffery, Thomas B., Ravenswood, Ill. Seat for velocipedes	384,980	June 26	1694	440	43	1462
Jenkins, Ambrose N., Sidney, Ohio. Harness	383,359	May 22	2202	582	43	962
Jenkins, Joel, Montclair, N. J. Safety-pin	380,896	Apr. 10	899	240	43	184
Jenkins, John H., Pittsburg, assignor of one-half to D. S. Carroll, Allegheny City, Pa. Wire-drawing die	382,650	May 8	1175	303	43	744
Jenkins Live Poultry Car Company. (See Jenkins, William P., assignor.)						
Jenkins, Salmon F., East Braintree, Mass. Making needles	383,733	May 29	2766	729	43	1088
Jenkins, William P., assignor to Jenkins Live Poultry Car Company, Chicago, Ill. Poultry-car	384,913	June 19	1601	416, 417	43	1442
Jenkinson, Richard C., Newark, N. J. Sheet-metal bag-handle	381,790	Apr. 24	2223	582	43	468
Jenks, Thomas M., Chicago, Ill. Railway-signal	381,247	Apr. 17	1436	386	43	994
Jenks, Thomas M., Chicago, Ill. Railway-freight-train signal	383,813	May 29	2806	767	43	1105
Jennings, William C., Camden, N. J. Portable drill	382,472	May 8	900	229, 230	43	689
Jensen, C. Louis, Milwaukee, Wis. Combined clod-crusher and land-roller	382,612	May 8	1117	287	43	739
Jensen, John C., Chicago, Ill. Paper-punch	385,056	June 26	1834	470	43	1497
Jewell Belting Company. (See Potter, Wilson L., assignor.)						
Jewell, Crews, Winter Park, Fla., assignor of three-fourths to W. S. Harbert and W. T. Rickards, Evanston, Ill. Revolving shelf	380,897	Apr. 10	900	241	43	184
Jewell, Harriet A., Cleveland, Ohio. Bustle	381,140	Apr. 17	1293	343	43	999
Jewell, Harvey L., Bangor, Me. Lantern	381,557	Apr. 24	1896	500	43	404
Jewell, M. Romeyn, assignor to Schlicht & Field Company, Rochester, N. Y. Suspension file-box	380,490	Apr. 3	268	74	43	55
Jewell, M. Romeyn, assignor to Schlicht & Field Company, Rochester, N. Y. Paper-file	384,168	June 5	485	133	43	1215
Jewell, Omar H., assignor of one-half to W. M. Mathisen, Chicago, Ill. Boot or shoe	380,804	Apr. 10	753	206	43	158
Jewell, William M., Pine, assignor, by mesne assignments, to J. A. McAnulty, Denver, Colo., and S. W. Sperry, Stockton, Cal. Automatic shelf-feeder (Reissue.)	10,933	May 29	2951	781	43	1114
Jewett, Charles C. and D. C., Sand Spring, Iowa. Hay-loader	381,248	Apr. 17	1438	386, 387	43	995
Jewett, Charles G., Howell, Mich. Water-heater	384,695	June 19	1293	337	43	1382
Jewett, Charles W. and G. H., assignors to Collins Manufacturing Company, Jackson, Mich. Road-cart	382,984	May 15	1631	427	43	843
Jewett, Dewitt C. (See Jewett, Charles C. and D. C.)						
Jewett, George H. (See Jewett, Charles W. and G. H.)						
Jewett, Luther K., Boston, Mass. Car-truck	383,180	May 22	1945	510	43	915
Jewett, Luther K., Boston, Mass. Car-truck	383,181	May 22	1946	510	43	915
Jewett, Luther K., Boston, Mass. Car-truck	384,981	June 26	1697	441	43	1469
Jewett, Luther K., Boston, Mass. Car-truck	384,982	June 26	1701	441	43	1470
Jocelyn, Albert H., Montclair, N. J., assignor of one half to W. A. Armstrong, Mount Vernon, N. Y. Pocket-book	384,527	June 12	1031	269	43	1324
Johns, David W., assignor of one-half to J. F. Belfour, Allegheny City, Pa. Saw-filing machine	381,249	Apr. 17	1440	387	43	995
Johns, Henry W. (See Pratt and Johns.)						
Johns, Henry W., New York, N. Y. Pipe-covering	385,119	June 26	1925	491	43	1516
Johns, Henry W., New York, N. Y. Filling, lining, and covering material	385,120	June 26	1926	491	43	1516
Johns, John B. and R., Massillon, Ohio. Fruit-jar	381,250	Apr. 17	1442	388	43	996
Johns, Samuel E., assignor of one-third to A. R. Monroe, Indianapolis, Ind. Machine for gathering and collating book-signatures	380,898	Apr. 10	901	241	43	185
Johnson, Albert W., New Haven, Conn., assignor to Peerless Button Hole Attachment Company, of Connecticut. Embroidering attachment for sewing-machines	384,257	June 12	625	169	43	1250
Johnson, Albert W., New Haven, Conn., assignor to Peerless Button Hole Attachment Company, of Connecticut. Mechanical movement	384,258	June 12	627	169	43	1251
Johnson, Alexander, assignor of one-half to J. N. Keefer, Camillus, N. Y. Door-check	383,643	May 29	2636	697	43	1053
Johnson, Alfred W., New Brunswick, N. J. Running-gear for vehicles	384,366	June 12	796	208	43	1279
Johnson, Andrew H., and A. G. Mahaffy, Tryus, Miss. Railway-gate	381,381	Apr. 17	1027	434	43	333
Johnson, Axel, and P. Larsson, Chicago, Ill. Door-mat	383,132	May 22	1882	491	43	902
Johnson, Charles, New Orleans, La. Machine for washing out the fibers of plants	384,851	June 19	1518	395	43	1426
Johnson, Charles H., and C. Allen, Chillicothe, Iowa. Locking mechanism for railway-switches	382,530	May 8	988	249	43	706
Johnson, Charles W. (See Pruitt, Eugene R., assignor.)						
Johnson, Duane C., *et al.* (See Johnson, Elmer E., assignor.)						
Johnson, Edward H., New York, N. Y. Telephone-transmitter	381,382	Apr. 17	1028	434	43	333
Johnson, Edward S. (See Johnson, Nathan S., assignor.)						
Johnson, Elmer E., assignor of two-thirds to H. L. and D. C. Johnson, Herkimer, N. Y. Lawn-mower	385,272	June 26	2156	550	43	1563
Johnson, Ernest V., Chicago, Ill. Brick-drying tunnel	381,383	Apr. 17	1631	434, 435	43	334
Johnson, Frank G., New York, N. Y. Upholstered furniture	384,259	June 12	629	169	43	1251
Johnson, Henry B., Clay Centre, Kans. Wind-wheel	383,467	May 29	2293	634	43	1092
Johnson, Henry C., El Dorado, Ark. Back-band	382,365	May 8	736	186	43	658
Johnson, Henry J., Providence, R. I., assignor to Plumb, Burdict & Barnard, Buffalo, N. Y. Stop-motion	384,040	June 5	297	83	43	1177
Johnson, Herbert L., *et al.* (See Johnson, Elmer E., assignor.)						
Johnson, Horace R., *et al.* (See Houghton, Charles E., assignor.)						
Johnson, Isaac G., Spuyten Duyvil, New York, N. Y. Converter for refining molten iron	384,628	June 19	1183	311, 312	43	1361
Johnson, Iver. (See Torkelson and Johnson.)						
Johnson, Iver, and R. T. Torkelson, Worcester, Mass.; said Torkelson assignor to said Johnson. Bench-plane	381,141	Apr. 17	1285	343	43	987
Johnson, J. Althens, *et al.* (See Kearney, William F., assignor.)						
Johnson, Jonathan, Lowell, Mass. Steam-boiler	381,791	Apr. 24	2224	582, 583	43	468
Johnson, Louis W., Spencer, Mo. Device for teaching fractions and percentage	383,300	May 22	2126	560	43	948

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drs.	Official Gazette. Vol.	Official Gazette. Page.
Johnson, Luman F., Cleveland, Ohio. Device for handling heavy masses of metal	381,474	Apr. 17	1769	472	43	360
Johnson, Nathan S., assignor of one-half to E. S. Johnson, Mendon, Mich. Hay-loader	381,699	Apr. 24	2097	549	43	444
Johnson Steel Street Rail Company. (See Du Pont, Alfred V., assignor.)						
Johnson Steel Street Rail Company. (See Entwisle, Edward B., assignor.)						
Johnson, Victor D., and V. Oppfelt, Mount Pleasant, Iowa. Farm-gate	382,703	May 15	1253	327	43	768
Johnson, Warren S., Milwaukee, Wis. Automatic temperature-regulator	382,165	May 1	420	110	43	580
Johnson, Warren S., assignor of one-half to W. Pinkinton, Milwaukee, Wis. Elevator	384,169	June 5	486	134	43	1215
Johnson, William, Jr. (See Tangye and Johnson.)						
Johnson, William H., Racine, assignor to Elastic Nut Company, Milwaukee, Wis. Nut-making machine	380,383	Apr. 3	129	39	43	28
Johnson, William P., *et al.* (See Williams, William P., assignor.)

Lea, Richard H. (See Singer and Lea.)						
Leach, Joseph, Haughville, assignor of one-half to C. G. Udell, North Indianapolis, Ind. Hoop	382,364	May 1	567	143	43	617
Leahy, James F., *et al.* (See Griffin, Patrick, assignor.)						
Leake, Frank, Philadelphia, Pa. Towel	381,046	June 5	805	86	43	1079
Leasure, Harvey E., Williamsburg, Iowa. Bill-holder	380,685	Apr. 10	579	150	43	125
Leather Lock Sewing Machine Association. (See Coupal, Peter A., assignor.)						
Leather Lock Sewing Machine Association. (See Coupal, Peter A. and J., assignors.)						
Leather Lock Sewing Machine Company. (See Coupal, Peter A. and J., assignors.)						
Leavell, Leonidas W., Jr., and R. E. L., Kearney, Mo. Tongue-support	383,183	May 22	1948	511	43	915
Leavell, Robert E. L. (See Leavell, Leonidas W., Jr., and R. E. L.)						
Leavitt, Erasmus D., Jr. (See Dean, Francis W., assignor.)						
Leavitt, Erasmus D., Jr., Cambridgeport, Mass. Valve-gear	380,328	Apr. 3	29	9, 10	43	8
Leavitt, Erasmus D., Jr., Cambridgeport, Mass. Valve-gear	380,329	Apr. 3	31	11, 12, 13	43	8
Leavitt, Erasmus D., Jr., Cambridgeport, Mass. Pump	380,330	Apr. 3	35	13	43	9
Leavitt, Frank M., assignor to E. W. Bliss Company, Brooklyn, N. Y. Drop-hammer	380,808	Apr. 10	757	207, 208	43	156
Leavitt, Frank M., assignor to E. W. Bliss Company, Brooklyn, N. Y. Selling-machine	384,770	June 19	1385	361	43	1401
Leavitt, Frank M., Brooklyn, N. Y., assignor to E. and O. W. Norton, Chicago, Ill. Apparatus for forming sheet-metal can-bodies	382,537	May 8	1001	254, 255, 256	43	709
Leavitt, Frank M., Brooklyn, N. Y., assignor to E. and O. W. Norton, Chicago, Ill. Can-heading machine	382,538	May 8	1006	256, 257	43	710
Leblanc, Leon. (See Frenier, John H., assignor.)						
Lechner Manufacturing Company. (See Lowry, Frank, assignor.)						
Lechner Manufacturing Company. (See Schenck, Edward, assignor.)						
Lechtenberg, Henry, Quincy, Ill. Valve-gear	382,168	May 1	425	111	43	301
Leconteux, Hippolyte, and E. Garnier, Paris, France. Steam-engine	382,479	May 8	915	231, 232	43	692
Ledgerwood Manufacturing Company. (See Beekman, John V., assignor.)						
Lee, Charles T., Boston, Mass. Shoe	381,259	Apr. 17	1452	301	43	299
Lee, Eliel H., Chicago, Ill. Wood working and planing machine	385,125	June 26	1933	493	43	1516
Lee, George W., assignor of one-half to W. H. Banker, Wooster, Ohio. Running-gear for vehicles	381,146	Apr. 17	1293	345	43	300
Lee, Henry F. (See Van der Hölen, Georges, assignor.)						
Lee, James, Linton, Iowa. Potato-digger	381,706	Apr. 24	2111	559	43	447
Lee, James D., Chicago, Ill. Smoke-consuming furnace	383,310	May 22	2138	564	43	950
Lee, James P., New York, N. Y. Magazine fire-arm	383,363	May 22	2207	584, 585, 586	43	964
Lee, Joseph D., Dallas, and J. H. Acton, Portland, Oreg. Shawl-strap and fire-escape	384,631	June 19	1186	313	43	1302
Lee, Lewis S., Philadelphia, Pa. Hair-clipping machine	382,288	May 1	905	153	43	624
Lee, Louis S. (See Phippa and Burman, assignors.) (Reissue.)						
Lee, Richard H., Altoona, Dak. Ter. Designation-badge	382,367	May 8	737	187	43	659
Lee, Thomas. (See Weitzel and Lee.)						
Lee, William W., Northampton, Mass. Lawn-sprinkler	384,699	June 19	1297	339	43	1393
Lee, Zachary T., Kosciusko, Miss. Pea, cotton-seed, or corn planter	382,886	May 15	1495	392	43	818
Leedom, Samuel W. (See Davey, Petherick, assignor.)						
Leeds, Albert R., Hoboken, N. J. Electrical apparatus for purifying water	383,184	May 22	1949	511	43	915
Leedy, Isaac. (See Duncan, Beverly W., assignor.)						
Lefeber, Henry, assignor of one-half to J. C. Wilson, Philadelphia, Pa. Cutting attachment for sewing-machines	382,169	May 1	426	111	43	592
Lefferts, Marshall C., New York, N. Y., and J. H. Stevens, Newark, N. J. Ink	380,654	Apr. 3	517	.....	43	105
Leffmann, Henry, Philadelphia, Pa. Manufacture of carbonic acid and heavy magnesia	381,957	June 5	171	50	43	1153
Leforestier, Alexander, Philadelphia, Pa. Musical wind-instrument	382,991	May 15	1638	429	43	845
Lefort, Jules F., Paris, France. Construction of water-wheels with movable floats or paddles	382,867	May 15	1496	392	43	818
Lehmann, Adolf, assignor of one-half to J. F. Luth, New York, N. Y. Caster	381,476	Apr. 17	1172	473	43	361
Lehnert, Henry G., Philadelphia, Pa. Drum	382,045	May 1	256	66	43	560
Leiby, Geoffrey B., Boston, Mass. Air-brake attachment	381,392	Apr. 17	1643	437	43	336
Leichsenring, Hermann R., Schönebeck, Prussia, Germany. Apparatus for putting driving-belts on pulleys	382,046	May 1	256	66	43	560
Leigh, Daniel, Groveport, Ohio. Cultivator-shovel	380,275	June 26	2159	551	43	1564
Leighton, John T., Edinburgh, county of Edinburgh, Scotland. Electro-magnetic spectacles	381,260	Apr. 17	1453	391	43	298
Leinbach, Felix W., *et al.* (See Lorens, William A., assignor.)						
Leland, Edwin A., assignor to C. C. Glock, Meriden, Conn., and L. Richardson, Brooklyn, N. Y. Railway-car-heating apparatus	384,452	June 12	912	237	43	1303
Lemaire, Henri F. M., Paris, France, assignor to C. C. Delmonico, New York, N. Y. Cigarette	384,858	June 19	1528	397	43	1428
Leman, Frank, Elgin, Ill. Machine for pointing, drilling, and reaming	380,496	Apr. 3	276	76, 77, 78	43	57
Leman, Frank, Elgin, Ill. Machine for the manufacture of pillars for watch-plates	380,497	Apr. 3	279	78, 79, 80	43	57
Leman, Frank, Elgin, Ill. Machine for the manufacture of gear-wheels	380,498	Apr. 3	283	80, 81, 82	43	58
Leman, Frank, Elgin, Ill. Manufacture of pinion-blanks	380,499	Apr. 3	287	82, 83, 84	43	58
Lemassena, Lillian. (See Zeliff, James, assignor.)						
Lemly, Charles C., Merrill, Wis. Flue-thimble	384,918	June 19	1609	418	43	1443
Lemon, G. Harland. (See Lemon, Hamlin T., assignor.)						
Lemon, Hamlin T., assignor of one-third to G. H. Lemon, Richmond, Ind. Atmospheric clothes-washer	384,453	June 12	913	238	43	1309
Lemp, Hermann, and M. J. Wightman, Hartford, Conn. Cut-out for incandescent lamps	383,091	June 5	63	20	43	1133
Lenau, Gustavus A., assignor to himself and W. E. White & Co., Providence, R. I. Bracelet-chain	385,313	June 26	2230	569	43	1575

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drs.	Official Gazette. Vol.	Official Gazette. Page.
Lenhart, George E., assignor of one-half to C. W. McIntyre, St. Paul, Minn. Switch-stand	383,738	May 29	2772	710	43	1081
Leslie, Benjamin J., Butler, Ky. Plaits or pinchers	380,331	Apr. 3	36	13	43	9
Leslie, Edward, Orangeville, Ontario, Canada. Rotary excavator for removing snow	380,689	Apr. 10	756	206	43	130
Lethert, Anthony, assignor to himself and M. Geis, Jordan, Minn. Vegetable-cutter	381,261	Apr. 17	1454	291, 292	43	299
Leukhardt, August. (See Medery and Leukhardt.)						
Leupold, William, Channahon, Ill. Fodder-binder	383,198	June 26	1934	494	43	1516
Lewis, Charles P., Sweet Springs, W. Va. Brace for bedsteads	381,892	Apr. 17	1456	302	43	299
Lewis, Ellsworth J., Bellaire, Ohio. Automatic air-brake	383,819	May 29	2916	770	43	1147
Lewis, Eugene F., Preston, Conn. Coal-chute	381,147	Apr. 17	1294	346	43	300
Lewis, Richard. (See Edwards, Lewis, and Jones.)						
Lewis, Russell H., assignor to B. L. Hall & Co., Providence, R. I. Hinged shoe-button	381,477	Apr. 17	1773	473	43	361
Lewis, William F., Washington, D. C. Bag-holder	384,434	June 19	914	238	43	1303
Lewton, George W., Centre Point, Iowa. Water-heater	385,976	June 26	2159	552	43	1564
Lezard, Edward J., London, county of Middlesex, England, assignor of one-half to A. S. Lascelles & Co., New York, N. Y. Device for holding watches	381,936	May 1	51	14	43	295
Libbey, Hosea W., Boston, Mass. Spark-arrester	381,707	Apr. 24	2112	559	43	447
Libby, Frederick M., Portland, Me. Perforated pen-holder	383,185	May 22	1951	512	43	916
Liberoth, Jesper J. H., New York, N. Y. Ironing-board	382,170	May 1	426	113	43	560
Licardie, Camille, Clermont, De San Marcos, Guatemala. Fish-plate	382,047	May 1	256	67	43	561
Liddell, Walter J. F., assignor of one-half to W. S. Liddell, Charlotte, N. C. Baling-press	381,263	Apr. 17	1457	303	43	299
Liddell, Walter S. (See Liddell, Walter J. F., assignor.)						
Liebmann, Rudolph, assignor to City Button Works, New York, N. Y. Button	380,561	Apr. 3	416	110	43	95
Lilea, Charles E. (See McMahon, Sharp, and Lilea.)						
Lillie, Benjamin A., San Francisco, Cal. Fruit-stoning machine	383,739	May 29	2773	730, 731	43	1081
Lillie, Benjamin A., San Francisco, Cal. Fruit-stoning machine	384,371	June 12	804	209	43	1301
Lincoln, Charles L., assignor of one-half to A. P. Van Tuyl, Jr., Brooklyn, N. Y. Dumb-waiter	381,958	June 5	172	50	43	1153
Lincoln, John L., Chicago, Ill. Clothes-drier	380,332	Apr. 3	37	14	43	10
Lindenthal, Gustav, Pittsburg, Pa. Refining iron	380,442	Apr. 3	198	.....	43	41
Linder, George. (See Farmer and Linder.)						
Lindley, Lafayette W., Louisville, Ky. Fence-post	382,992	May 15	1639	429	43	845
Lindner, Charles, and T. F. Hammer, Branford, Conn. Salt-feeding device	382,048	May 1	256	67	43	561
Lindsay, Marcellus J., and D. M. Ross, Bellevue, Iowa. Measuring-tank for oil	384,906	June 26	1707	443	43	1471
Lindsey, Leroy J., Seymour, Iowa. Railway-switch	380,562	Apr. 3	417	118, 119	43	95
Lindsley, Edward, Cleveland, Ohio. Street-box and shut-off for water, gas, or other fluid service	383,478	May 29	2390	626	43	1082
Lines, Fred, assignor of two-thirds to F. Hisley and M. J. Hogan, Syracuse, N. Y. Fifth-wheel	384,638	June 19	1187	313, 314	43	1302
Lines, Samuel M., Indianapolis, Ind. Clasp	382,469	May 8	916	232	43	693
Linscott, John F., Jefferson, Ill. Cook-stove ventilator	380,500	Apr. 3	290	84, 85	43	89
Linscott, John M., Worcester, Mass. Car-starter	381,393	Apr. 17	1644	438	43	337
Linsley, Newton, and C. E. Forry, Freeport, Ill. Surface-gage	381,937	May 1	52	14	43	295
Linville, Benjamin A. (See Miller, John F., assignor.)						
Lippincott, Jesse H., *et al.* (See Niemstädt, Ernst, assignor.)						
List, William A., Wheeling, W. Va. Stove-pipe	381,021	Apr. 10	1084	288	43	319
Littell, Hardin H., Louisville, Ky. Track-scraper	385,063	June 26	1644	472	43	1499
Little, Addison M., Menasha, Wis. Machine for making excelsior	382,431	May 8	889	212	43	677
Little, Charles H., Pittsburg, Pa. Device for carrying cars over temporary obstructions	382,711	May 15	1261	330	43	770
Little, Orton C., Menasha, Wis. Feed-cutter	384,908	June 5	545	150	43	1297
Littlefield, Charles A., assignor to E. A. Tuttle and J. T. Milne, Fall River, Mass. Loom for cross-weaving	380,760	Apr. 10	692	190, 191	43	147
Littlefield, Charles A., assignor to E. A. Tuttle and J. T. Milne, Fall River, Mass. Loom for cross-weaving	380,761	Apr. 10	693	191, 192	43	147
Littlefield, Charles W., Amesbury, Mass. Railway-car	384,987	June 26	1708	443	43	1471
Littlefield, John W., Everett, Mass. Dress-form	384,372	June 12	807	210	43	1302
Livingstone, William, Jersey City, N. J. Door-knob and connecting-shank for the same	382,333	Apr. 3	36	14	43	10
Lloyd, Walter C., *et al.* (See Patterson and Noteman, assignors.)						
Locke, Edward A., Manchester, county of Lancaster, England. Piano-forte, organ, harmonium, or other musical instrument	382,481	May 8	917	232	43	693
Locke, Sylvanus D., Hoosick Falls, N. Y., assignor of one-half to McCormick Harvesting Machine Company, Chicago, Ill. Mold for casting metal	383,060	May 15	1766	456	43	870
Lockerbie, Thomas. (See Tolhurst, Glasbrook, Philbar, and Lockerbie.)						
Lockett, John E., Dancyville, assignor of one-half to J. S. and J. W. Rhea, Somerville, Tenn. Cotton-press	380,334	Apr. 3	40	15	43	10
Lockhart, Horatio J., Fostoria, Ohio. Washing-machine	380,306	Apr. 3	133	40	43	99
Lockwood, Amelia R. (See Bedford, George J., assignor.)						
Lockwood, Charles L., Philadelphia, Pa. Knockdown box	382,312	May 8	647	165	43	643
Loder, George D., Covington, Ky. Sash-fastener	380,501	Apr. 3	291	85	43	89
Lodge, William, and H. Dreses, Cincinnati, Ohio. Feeding device for drilling	385,063	June 26	1645	472	43	1499
Loehner, August, St. Louis, Mo. Shaft-hanger	383,532	May 29	2488	656	43	1081
Loewenbach, Hugo, and W. F. H. Matter, Milwaukee, Wis. Sheet-straightener for printing-presses	381,800	Apr. 24	2237	588	43	471
Logan, Ralph H., and G. H. Culley, Allegheny, assignors to J. K. Collins, Glenfield, Pa. Cigar-bunching machine	384,265	May 1	567	143, 144	43	618
Losey, William. (See Stokes, Losey, and Favell.)						
Long, Charles R., Louisville, Ky. Window-ventilator	383,562	May 29	2549	673	43	1034
Long, George S., assignor of two-thirds to E. H. Judd and F. C. Rockwell, Hartford, Conn. Barrel	381,077	Apr. 10	1181	314	43	326
Long, Joseph N., and J. McCaffrey, Le Claire, Iowa. Bearing and support of rudder-stocks upon vessels	381,148	Apr. 17	1295	346	43	299
Loomis Electric Manufacturing Company. (See Loomis, Osborn P., assignor.)						
Loomis, Osborn P., Somerville, Mass., assignor to Loomis Electric Manufacturing Company, New York, N. Y. Commutator-brush for electric generators	381,394	Apr. 17	1646	438	43	337
Lord, George S. (See Devereux, Joel, assignor.)						
Lore, George W., assignor of four-fifths to G. L. and C. T. Sill, L. W. Briggs, and J. S. Spencer, Detroit, Mich. Machine for scouring cans	383,400	May 22	2268	603	43	975
Loree, Manfred, assignor of two-thirds to D. P. Clark, Miamisburg, and C. E. Clark, Dayton, Ohio. Truck	380,335	Apr. 3	42	15	43	10
Lorenz, Wilhelm, Carlsruhe, Baden, Germany. Compressing gunpowder or analogous materials	380,696	Apr. 10	579	150	43	125
Lorenz, Wilhelm, Carlsruhe, Baden, Germany. Percussion-fuse	381,264	Apr. 17	1459	303	43	299

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Lorenz, Wilhelm, Carlsruhe, Baden, Germany. Vertical breech-closing mechanism for looms	381,698	Apr. 24	1908	525	43	424
Lorenz, William A. (See Heniss and Lorenz.)						
Lorenz, William A., Hartford, Conn., assignor to F. W. Leinbach and C. A. Wolle, Bethlehem, Pa. Making creases in sheets of flexible or elastic material	380,397	Apr. 3	135	40	43	89
Lorenz, William A., and W. H. Heniss, Hartford, Conn. Pasting apparatus	3-5,064	June 26	1846	472	43	1499
Loreta, Arthur J. L., Brooklyn, N. Y. Cutting-machine	383,899	June 5	65	20	43	1133
Lorillard, Pierre, Jr., New York, N. Y. Receptacle for tobacco	381,801	Apr. 24	2229	598	43	471
Lorraine, Madison J., and C. T. Aubin, St. Louis, Mo. Car-coupling. (Reissue.)	10,941	June 26	2250	578	43	1561
Loseman, James F. (See Stewart, William A., assignor.)						
Lothrop, Leonard R., *et al.* (See Dean, Henry W., assignor.)						
Lottimer, William A. (See Jamieson, Augustus, assignor.)						
Lottridge, Thomas A., Rochester, and J. V. Einsfield, assignors to Chappell, Chase, Maxwell & Co., Oneida, N. Y. Coffin-fastener	383,311	May 22	2139	564	43	951
Loud, John J., Weymouth, Mass. Fire-cracker cannon	385,137	June 26	1935	494	43	1518
Lourie, Herbert M., Keokuk, Iowa. Force-pump	384,633	June 19	1188	314	43	1363
Louther, Winfield S. (See Carter and Louther.)						
Love, John C., Philadelphia, Pa. Electrical railway	381 395	Apr. 17	1647	{438 439}	{43 43}	337
Love, John C., and J. F. Snediker, Philadelphia, Pa., assignors to said Love. Railway-car	381,396	Apr. 17	1649	{439 440}	{43 43}	338
Lovejoy, Henry L., Lowell, Mass. Cash and parcel carrying apparatus	382,809	May 15	1499	393	43	819
Lovejoy, Russel P., Greig, N. Y. Sprinkling-machine	383,740	May 29	2775	731	43	1092
Lovell, James L., Austin, Nev. Ore-roasting furnace	381,639	Apr. 24	2001	525	43	494
Low, A. Augustus, Brooklyn, assignor to Alden Type Machine Company, New York, N. Y. Type containing channel	381,892	Apr. 24	2240	587	43	471
Low, A. Augustus, Brooklyn, assignor to Alden Type Machine Company, New York, N. Y. Lead and rule holder	383,959	June 5	174	51	43	1154
Low, A. Augustus, Brooklyn, assignor to Alden Type Machine Company, New York, N. Y. Lead and rule holder	383,960	June 5	177	51, 52	43	1154
Low, A. Augustus, Brooklyn, assignor to Alden Type Machine Company, New York, N. Y. Lead and rule holder	383,961	June 5	180	52	43	1155
Low, A. Augustus, Brooklyn, assignor to Alden Type Machine Company, New York, N. Y. Lead and rule holder	383,962	June 5	183	53	43	1155
Lowden, James J., Boston, Mass. Regulating live steam and exhaust from steam-engines	381,149	Apr. 17	1296	346	43	269
Lowden, James J., Boston, Mass. Separator	381,150	Apr. 17	1297	347	43	269
Lowentraut, Peter. (See Hall, George F., assignor.)						
Lowry, Frank, assignor to Lechner Manufacturing Company, Columbus, Ohio. Mining-machine	383,061	May 15	1768	457	43	870
Lubker, Henry, Columbus, Nebr. Guard-finger for mowers and reapers	383,473	May 29	2302	636	43	1004
Lucas, William M., Uhrichsville, Ohio. Flour-bolt	383,068	May 15	1769	{457 458}	{43 43}	870
Luce, Edwin W., Bolivar, N. Y. Throttle-valve	382,983	May 15	1640	429	43	845
Luce, Edwin W., Bolivar, N. Y. Automatic car-brake	382,984	May 15	1642	430	43	846
Luce, Edwin W., Bolivar, N. Y. Sash fastener	384,535	June 12	1040	271	43	1328
Lucock, John S. (See Williams and Lucock.)						
Ludlum, Albert C., Brooklyn, N. Y. Adding and writing machine	384,373	June 12	808	210	43	1262
Ludwig, Bernhard, Vienna, Austria-Hungary. Machine for embossing wood or other material	380,904	Apr. 10	907	{243 244}	{43 43}	166
Ludwig, Hermann C., New York, N. Y. Embroidering frame and stand	383,533	May 29	2490	657	43	1021
Ludwig, John C., San Francisco, Cal. Station-indicator	383,230	May 22	2018	{529 530}	{43 43}	999
Lull, Albert G., Chicago, Ill. Garment-supporter	383,893	June 5	66	20	43	1133
Lumb, William, trustee. (See Foote, Theodore M., assignor.)						
Lund, John C., Eau Claire, Wis. Fire-escape	381,478	Apr. 17	1775	474	43	362
Lund, William, Philadelphia, Pa., assignor to H. Wyman, Worcester, Mass. Wool-combing machine. (Reissue)	10,930	May 15	1922	476	43	879
Lundborg, Charles G., New York, N. Y. Construction of ships, &c	384,047	June 5	306	87, 88	43	1179
Lung, Charles J., Jamestown, N. Y. Ice-creeper	382,432	May 8	831	213	43	678
Lunkenheimer, Frederick, Cincinnati, Ohio. Non-conducting hand-wheel for cocks, valves, and other steam-fittings	382,474	May 29	2393	636	43	1004
Lupien, Edmond A., Wayland, Mass. Breasting attachment for beeling-machines	382,615	May 8	1121	{288 289}	{43 43}	733
Luth, John F. (See Lehmann, Adolf, assignor.)						
Luther, James D. (See Sharp and Luther.)						
Lutz, George W., assignor of one-half to J. S. Trimble, Wheeling, W. Va. Pipe-hanger	382,171	May 1	429	112	43	362
Lutz, George W., assignor of one-half to J. S. Trimble, Wheeling, W. Va. Apparatus for testing pipes	382,172	May 1	429	112	43	362
Lutz, George W., and J. M. Dillon; said Dillon assignor, by mesne assignments, to J. S. Trimble, Wheeling, W. Va. Apparatus for testing pipes	382,205	May 1	569	144	43	618
Lutz, William F., Jr., New York, N. Y. Car-axle	383,930	May 29	2919	770	43	1107
Lux, John H., P. Lux, deceased, (J. H. Lux administrator,) and S. Ede, Earlville, Iowa. Hay rake and loader	380,336	Apr. 3	43	15, 16	43	10
Lux, Philip. (See Lux and Ede.)						
Lyman, Charles, Clarinda, Iowa. Miter-box	380,632	Apr. 3	485	126	43	89
Lyman, Fordyce A., Cleveland, Ohio. Vapor-burner	381,843	Apr. 24	2319	603	43	496
Lyman, Fordyce A., Cleveland, Ohio. Vapor-burner	382,658	May 8	1177	304	43	745
Lyman, Moses. (See Crandall, Charles M., assignor.)						
Lynch, Edward P., Davenport, Iowa. Walking-cultivator	384,048	June 5	309	88	43	1180
Lynch, Michael, Chicago, Ill. Ash-sifter	383,312	May 22	2140	565	43	951
Lyon, Benjamin W., San Francisco, Cal. Station-indicator	385,314	June 26	2290	589	43	1575
Lyon, James G., Brooklyn, N. Y. Broiling-oven for ranges	384,049	June 5	310	88	43	1180
Lyon, Louis A., Shorter's Depot, Ala. Automatic fire-extinguisher for car-heaters	381,561	Apr. 17	1816	481	43	371
Lytle, Henry B., Webb's Mills, N. Y. Liquid-forcing apparatus	382,876	May 1	522	134	43	666
Lyttle, La Fayette, Toledo, Ohio. Sword	384,560	June 12	1113	295	43	1330
Maas, Hugo F., Egg Harbor City, N. J. Copy-holder for compositors	384,374	June 12	811	210	43	1262
Mabbey, Jesse T., Forest, Ohio. Railway-crossing	382,173	May 1	429	{112 113}	{43 43}	362
MacDonald, John A., Lowell, Mass. Micrometer-gage	384,771	June 19	1380	363	43	1462
Macdonald, Franklin, New York, N. Y. Inking apparatus for lithographic presses	381,709	Apr. 24	2113	553	43	447
Macdonald, Frederick W. C., Chicago, Ill. Rein-holder	384,980	June 26	1709	443	43	1472
Macer, Jacob F., Allendale, Ill. Car-coupling	380,389	Apr. 3	128	40	43	89
Macintosh, Robert M., Boston, Mass. Wax-end machine	384,709	June 19	1368	339	43	1384
Mackay, George H., assignor of one-half to O. Woodbury, Salem, N. H. Shaft-coupling	382,725	May 15	1331	350	43	794
Mackay, Robert, Warren, Pa. Valve-gear	383,983	June 5	185	56	43	1156

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Mackel, Thomas, Pawtucket, R. I. Coupling for hose and faucets	381,502	Apr. 24	1991	501	43	405
Mackey, William J., Truro, Ill. Wagon-brake	380,502	Apr. 3	202	85	43	89
Mackie, Robb, assignor to J. B. Tibbitts, Troy, N. Y. Armature for dynamo-electric machines	382,174	May 1	434	113	43	362
Mackintosh, John C., assignor of one-half to A. F. Tillotson, Erie, Pa. Bottle-washer	381,944	June 5	186	54	43	1156
Maddan, Albert F., Newark, N. J., assignor to Electrical Accumulator Company, of New York. Apparatus for preparing secondary-battery plates	382,086	May 1	333	87, 88	43	674
Maddin, Mary. (See Maddin, Samuel D., assignor.)						
Maddin, Samuel D., assignor to M. Maddin, Miamisburg, Ohio. Harvester	382,040	May 1	361	87, 88	43	361
Magruder, George C. W., Tenallytown, assignor of two-thirds to American Patent Exchange, Washington, D. C. Carriage-wheel fender	384,980	June 26	1710	444	43	1472
Mahaffa, John. (See Newbanks and Mahaffa.)						
Mahaffy, Albert G. (See Johnson, and Mahaffy.)						
Mahaffy, Henry, assignor to J. Anderson, New York, N. Y. Printing-telegraph receiver	384,455	June 12	916	238	43	1303
Mahan, Charles, Washington, D. C. Device for removing obstructions or preventing accidents on street-railways	381,881	Apr. 24	2377	618	43	497
Mahan, James P. and J. S., New York, N. Y. Coffin	384,701	June 19	1300	339	43	1364
Mahan, John S. (See Mahan, James P. and J. S.)						
Mahoney, John J., Holden, Mass. Pulley-bushing	381,151	Apr. 17	1298	347	43	269
Maier, Wilhelm, Grünau, near Berlin, and G. Richter, Falkenberg, near Grünau, Prussia, Germany. Making hydrogen	380,726	Apr. 10	635	175	43	136
Makemson, Thomas, Mound City, Kans. Evaporating-pan	384,772	June 19	1392	364	43	1403
Malke, Frederick E. R., Chrisney, Ind. Grain-adjuster for binders	384,702	June 19	1301	{339 340}	{43 43}	1364
Mallary, Richard S. (See White, Alice, assignor.)						
Mallett, Edward J., Bay Side, N. Y. Printing-telegraph	384,320	June 12	715	{190 191}	{43 43}	1267
Mallett, Edward J., Bay Side, N. Y. Polarized electro-magnet	384,321	June 12	720	191	43	1267
Mallett, Edward J., Bay Side, N. Y. Printing-telegraph	384,322	June 12	720	191	43	1267
Mallett, Edward J., New York, N. Y. Automatic pole-changer	384,323	June 12	722	191	43	1267
Mallett, Edward J., New York, N. Y. Automatic telegraphy	384,324	June 12	724	192	43	1268
Mallett, Edward J., New York, N. Y. Automatic telegraphy	384,325	June 12	726	193	43	1269
Mallett, Edward J., New York, N. Y. Automatic pole-changer	384,326	June 12	732	193	43	1269
Malmberg, Hjalmar. (See Whiting, Preston H., assignor.)						
Malmberg, Hjalmar, Cortland, N. Y. Two-wheeled vehicle	382,175	May 1	436	{113 114}	{43 43}	362
Malone, Micajah C., Palmyra, Ill. Pruning implement	380,583	Apr. 3	419	119	43	85
Maloue, Peter J., Altoona, Pa. Model for dental plates	382,539	May 8	1008	257	43	711
Mancini, Louis A., Montclair, N. J. Double-harness saddle and yoke	384,703	June 19	1302	340	43	1364
Mandelbaum, Solomon, Chicago, Ill. Adjustable pattern-chart	381,563	Apr. 24	1902	501	43	405
Mandell, Michael, *et al.* (See Maurino, Henry Q., assignor.)						
Mangan, Thomas, New Orleans, La. Rein-holder	380,337	Apr. 3	45	16	43	11
Mangum, Daniel D. (See McMahon and Mangum.)						
Manhattan Clock Company. (See Parcells, Albert L., assignor.)						
Manhattan Watch Company. (See Kuhn, Edmond, assignor.)						
Manlove, George W., and E. A. Parker, Nashville, Ill., assignors to said E. A. Parker and H. Parker, Milwaukee, Wis., and E. L. Parker, Minneapolis, Minn. Wagon-box	381,479	Apr. 17	1778	474	43	362
Mann, Edgar E., assignor, by mesne assignments, to W. J. Scott, Newburg, N. Y. Fog-signal	380,584	Apr. 3	420	{119 120}	{43 43}	86
Manning, Bradley, Swanton, Ohio, assignor of two-thirds to E. D. Manning, Chicago, Ill., and J. F. Strayer, Swanton, Ohio. Carpet-stretcher	384,456	June 12	918	238	43	1304
Manning, Edward D., *et al.* (See Manning, Bradley, assignor.)						
Manning, William T., assignor of one-half to I. N. Kalbaugh, Pittsburg, Pa. Railway-switch lock	383,985	June 5	187	55	43	1156
Manny, Eugene S., Montreal, Quebec, Canada. Hot-water boiler	382,313	May 8	648	165	43	643
Maser, Lewis J., Delphi, Ind. Tongue-support	380,503	Apr. 3	203	86	43	89
Mansfield, Edward, Orono, Me. Making cant-hook ferrules	383,135	May 22	1666	420	43	903
Manson, Asa D., Overton, Mass. Harrow	384,457	June 12	919	239	43	1304
Manville, Robert C. (See Kleinert and Manville.)						
Maple, Alfred L. (See Vandegrift and Maple.)						
Marble, George L., assignor to Fitchburg Machine Works, Fitchburg, Mass. Clamping device for cross-beams of planers	382,653	May 8	1179	{304 305}	{43 43}	745
Marble, William S., assignor of one half to C. J. Spielberger, Philadelphia, Pa. Sleigh	383,401	May 22	2270	602	43	974
March, John W., *et al.* (See Phillips, Elwood C., assignor.)						
Marcoux, Moise, Springfield, Mass. Automatic fan attachment for rocking-chairs	381,897	Apr. 24	2404	625	43	503
Marelle, René, Paris, France. Vending apparatus	381,397	Apr. 17	1650	440	43	336
Margeson, Manly E., Rogersville, Mich. Portable fence	383,475	May 29	2394	637	43	1004
Marjerison, James, Lawrence, Mass. Spinning-machine	381,586	Apr. 24	1905	502	43	406
Marjerison, James, Lawrence, Mass. Spinning-machine	381,587	Apr. 24	1906	503	43	406
Markle, Walter, Tanganoxie, Kans., assignor of one-half to F. M. Vanden, Kansas City, Mo. Heating-drum	383,741	May 29	2776	731	43	1093
Marks, Lewis C. (See Allen, William R., assignor.)						
Marks, Louis, assignor of two-thirds to G. Schlesinger and G. Burkhardt, San Francisco, Cal. Carburetor	382,819	May 15	1405	{358 359}	{43 43}	799
Mariand, Alfred J., Pittsburg, Pa. Nut-machine	385,198	June 26	1936	{494 495}	{43 43}	1518
Marlin Fire Arms Company. (See Rice, David H., assignor.)						
Marlin, Mahlon H., New Haven, Conn. Velocipede	384,980	June 26	1711	444	43	1472
Marmon, Daniel W., assignor to Nordyke & Marmon Company, Indianapolis, Ind. Shifting gate for conveyers	382,880	May 15	1501	393	43	819
Marquis, Daniel M., Kokomo, Ind. Sliding joint for gas-mains	381,603	Apr. 24	2242	567	43	471
Marr, Augustus D., Boston, Mass. Chair	383,231	May 22	2019	530	43	930
Marr, William C., Onawa, Iowa. Pliers	382,718	May 15	1262	330	43	770
Marsh, Robert A. (See Bignall and Marsh.)						
Marsh, William H., New York, N. Y. Hydraulic elevator	383,232	May 22	2021	530	43	930
Marshall, Charles P., Memphis, Tenn. Steam-boiler	383,364	May 22	2212	{566 567}	{43 43}	964
Marshall, George F., Brooklyn, N. Y. Valve-connection for hopper water-closets	382,880	May 15	1406	360	43	799
Marshall, George V. (See Ballard, Samuel R., assignor.)						
Marshall, Godfrey, Indiana, Pa. Horse-collar fastener	382,540	May 8	1009	257	43	711
Marshall, John S., Imlay City, Mich. Valve for steam-engines	381,158	Apr. 17	1269	347	43	270
Marshall, Robert, Pittsburg, Pa. Lubricator	381,404	Apr. 24	2243	567	43	472
Marsters, Joseph D., Boston, Mass. Combination-tool	382,621	May 15	1407	360	43	799

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g's	Official Gazette. Vol.	Official Gazette. Page.
Marston, F. Du Pont, Philadelphia, Pa. Electrical telephone	380,905	Apr. 10	908	244	43	196
Martens, Henry A., St. Joseph, Dak. Ter. Bag-fastener	381,985	Apr. 17	1462	383	43	300
Martin, Charles H., Bridgeport, Conn. Heel for boots or shoes	384,634	June 19	1190	314	43	1353
Martin, Charles W., Wallaceburg, Ontario, Canada. Swing-bridge	380,906	Apr. 10	960	244	43	196
Martin, Edward G. Concordia, Kans. Vapor-burner	381,153	Apr. 17	1301	{347 / 348	43	270
Martin, Edwin K. (See Abraham and Martin.)

McKinney, Charles B., Tarport, assignor of one-half to W. C. Walker, Bradford, Pa. Drilling-jar	380,634	Apr. 3	487	137	43	99
McKinney, Finch, San Diego, Cal. Hay-press	382,822	May 15	1408	369 / 370	43	690
McKinney, Z. Taylor, Piedmont, S. C. Loom-shuttle relief mechanism	382,985	May 15	1647	431	43	846
McKinnon, James W., Newark, N. J. Ventilator	383,318	May 22	2142	565	43	951
McKnight, Thomas R., Mount Pleasant, Iowa. Mechanical movement	382,101	May 1	338	89	43	575
McLachlan, Angus, (See Rowland, Hill, and McLachlan.)						
McLaren, Francis J., New York, N. Y. Blow-pipe furnace	383,971	June 5	193	56	43	1157
McLaughlin, Edgar A., assignor of one-half to H. J. Waller, Horseheads, N. Y. Self-acting or automatic pressure-regulator	383,314	May 22	2143	565	43	951
McLaughlin, James F., Philadelphia, Pa. Electro-magnetic register	383,563	May 29	2550	674	43	1634
McLaughlin, James T. W., assignor of one-half to L. Crull, Harrisburg, Pa. Step-ladder with jump-shelf	382,102	May 1	339	89	43	575
McLellan, Donald. (See Quinn and McLellan.)						
McLeod, Angus G., Hallock, Minn. Hame-fastener	382,103	May 1	340	90	43	576
McMahon, Frank, A. C. Sharp, and C. E. Lilee, Darlington, Indian Ter. Pitman attachment for mowing-machines	382,891	May 15	1502	393	43	690
McMahon, James H., New Milford, and D. D. Mangum, Lanesville, Conn.; said Mangum assignor to said McMahon. Wire-stretcher	381,569	Apr. 24	1918	504	43	497
McManus, Alonzo, New Britain, Conn. Spur	384,774	June 19	1395	364	43	1494
McMorries, James, Thorp's Spring, Tex. Horse-detacher	381,712	Apr. 24	2121	554	43	648
McMullin, William, Chicago, Ill. Fire-escape	384,376	June 12	813	211	43	1293
McNeal, Andrew H., and W. A. Stinerack, Burlington, N. J. Pipe-molding apparatus	383,534	May 29	2491	657	43	1632
McNeal, Luther C., Rochester, N. Y. Button-hole scissors	382,998	May 15	1648	431	43	847
McNamee, John C., Hope, Kans. Liquid-meter	384,265	June 12	698	171	43	1296
McPartland, James H. (See Campbell and McPartland.)						
McPherson, Ebenezer M., Boston, Mass. Dress-form	383,535	May 29	2492	657	43	1632
McPherson, Henry, assignor to Sweet & Clark Manufacturing Company, Troy, N. Y. Snap-hook	384,992	June 26	1714	445	43	1473
McSweeney, Terrence, Allegheny, assignor of one-half to T. A. Gillespie, Pittsburg, Pa. Composition for surfacing structural articles	381,682	Apr. 24	2080	.....	43	497
McTighe, Thomas J., New York, N. Y. Directory-indicator for buildings, &c.	382,997	May 15	1650	431	43	847
Meacham, E. F. (See Hoagland, John B., assignor.)						
Mead, Albert G., Boston, Mass., assignor to International Fastening Company, Portland, Me. Machine for rolling flanged eyelets	383,403	May 22	2272	604	43	974
Mead, Charles L., New York, N. Y., assignor to Stanley Rule and Level Company, New Britain, Conn. Chisel-gage	380,821	Apr. 10	762	209	43	169
Mead, Theodore H., *et al.* (See Crowell, Luther C., assignor.)						
Mears, Camden and J. W., Bloomsburg, Pa. Washing-machine	380,445	Apr. 3	394	55, 56	43	62
Mears, John W. (See Mears, Camden and J. W.)						
Mecklenburg, William. (See Koesling and Mecklenburg.)						
Meckley, John F., *et al.* (See Bostian, Charles P., assignor.)						
Meehan, Michael, Boston, Mass. Cendnit	384,690	June 19	1530	390	43	1468
Meehan, Patrick W., Providence, R. I. Valve	381,656	June 5	380	91	43	1188
Meese, Arthur G., Redhill, county of Surrey, England. Apparatus for the manufacture of gas	382,371	May 8	742	187 / 188	43	639
Meese, Arthur G., Redhill, county of Surrey, England. Manufacturing gas from oil and steam	382,372	May 8	746	188	43	639
Meese, Arthur G., Redhill, county of Surrey, England. Making coal-gas	382,373	May 8	747	189	43	641
Meese, Arthur G., Redhill, county of Surrey, England. Manufacturing gas	382,374	May 8	749	189	43	641
Meese, Arthur G., Redhill, county of Surrey, England. Apparatus for the manufacture of gas	382,375	May 8	751	189	43	641
Megee, Andrew J., assignor to Miller Megee Company, Philadelphia, Pa. Binding of books	383,315	May 22	2144	565 / 566	43	950
Mehl, John, Jr., Jersey City, N. J. Hand-bag	384,377	June 12	814	211	43	1293
Mehl, Robert H., and R. Knott, Brooklyn, N. Y. Candlestick	380,506	Apr. 3	390	67	43	61
Meikel, Charles W. (See Miller, Harrison S., assignor.)						
Meiners & Schuette. (See Rohde, Peter W., assignor.)						
Meise, Eduard, Pittsburg, assignor of one-half to G. Kaufman, Cresson, Pa. Seal-lock	380,446	Apr. 3	388	56	43	62
Melchior, Edward, Chicago, Ill. Barber's chair	380,909	Apr. 10	912	245	43	187
Melendy, Bryant H., Battle Creek, Mich. Dough-kneading machine	381,631	Apr. 24	2083	565	43	495
Melhorn, Lewis M. (See Neiman and Melhorn.)						
Melkersman, Fredrich, St. Charles, Mo. Centrifugal grain-drying machine	383,747	May 29	2786	733	43	1634
Melkersman, Fredrick, St. Charles, Mo. Grain-separator	384,861	June 19	1531	398	43	1492
Mellert, Albert H., assignor to Mellert Foundry and Machine Company, (limited,) Reading, Pa. Fire-hydrant	381,940	May 1	59	15	43	566
Mellert Foundry and Machine Company. (See Mellert, Albert H., assignor.)						
Melone, Thomas L., Chillicothe, Ohio. Sewing-machine	383,748	May 29	2787	733 / 734	43	1634
Menche, John A. (See Stille, Theodore J. and O. Q., assignors.)						
Mengis, Morris C., New York, N. Y. Electro-magnetic parcel-carrier	384,775	June 19	1396	365	43	1494
Menke, Robert W. and W., Sanborn, Dak. Ter. Belt-carrier tightener	380,400	Apr. 3	138	41	43	99
Menke, William. (See Menke, Robert W. and W.)						
Mentzel, Henry D., Baltimore, Md. Grease-cup	381,157	Apr. 17	1307	349	43	271
Mentzer, Jonathan R., assignor to W. R. Fox, Grand Rapids, Mich. Dado-cutter	384,209	June 5	546	150	43	1227
Merckel, William C., New York, N. Y. Sash-balance	384,459	June 12	991	239	43	1384
Merriam, Joseph, Middletown, Conn. Clasp	385,192	June 26	2027	519	43	1537
Merithew, Zacheus W., assignor of one-half to L. F. Gage, Grand View, Ind. Fruit-drier	382,617	May 8	1194	299 / 300	43	734
Mermod Frères. (See Campiche, Louis, assignor.)						
Merrill, Charles L., Indianapolis, Ind. Machine for cutting veneers	384,057	June 5	322	91, 92	43	1188
Merrill & Co., S. K. (See Bugbee, George C., assignor.)						
Merrill, William, assignor of one-half to S. S. Mitts, East Saginaw, Mich. Machine for cutting wood	384,764	June 19	1393	340	43	1365
Merriss, John, and A. S. Muncey, Shannock, R. I. Nut-lock	384,378	June 12	815	212	43	1293
Merritt, Edward. (See Tyler and Merritt.)						
Merritt, Henry W., Somerville, Mass. Stove-grate	382,543	May 8	1013	258	43	712
Meserean, Edgar W., Brooklyn, N. Y. Pan	383,658	May 29	2647	700	43	1656
Meserole, Abraham V., New York, N. Y. Secondary battery	381,941	May 1	61	15	43	566
Messinger, William T., Cambridge, Mass., assignor to G. T. Power, Chicago, Ill. Combined pipe-coupling and check valve or chamber	383,498	May 22	2314	613	43	992

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
Metcalf, Robert. (See Edgerton and Metcalf.)						
Metzinger, William, Cleveland, Ohio. Vapor-burner	382,892	May 15	1503	394	43	690
Metzner, William C., Chicago, Ill. Stove-back	381,713	Apr. 24	2122	554	43	649
Meyer, August, Hamburg, Germany. Wick-trimmer	382,050	May 1	264	68, 69	43	582
Meyer, Charles E. (See Perrin, Charles, assignor.)						
Meyer, George A., Brooklyn, N. Y. Cheek and pad protector	382,998	May 15	1651	431	43	847

Payne, Samuel A., assignor of two-thirds to J. L. Fisher and J. M. Stout, Scottsburg, Ind. Hand-planter	381,983	Apr. 10	1199	321	43	941
Peabody, George H., Kansas City, Mo. Cartridge for tobacco-pipes	380,580	Apr. 3	229	121	43	48
Pearce, John W., assignor of two-thirds to C. R. Britton and E. S. Waller, Cleveland, Ohio. Step-ladder and bench combined	383,943	May 22	2036	534	43	936
Pearce, Jacob A., Denver, Colo. Fountain-brush	380,345	Apr. 3	53	18	43	13
Pearce & Jones. (See De Rodon, Constant F., assignor.)						
Pearce, Thomas A. (See Merley and Greenwood, assignors.)						
Pearce, Thomas A. (See Rightmire, Harry C., assignor.)						
Pearn, George R. (See Sprague and Pearn.)						
Pearnall, Howard D., London, England. Hydraulic apparatus for raising water, &c	382,360	May 8	760	193	43	663
Pearson, Eugene, *et al.* (See Atkinson, William W., assignor.)						
Pearson, Fred, assignor of one-half to J. C. Graham, Philadelphia, Pa. Pile-warp delivery mechanism for double-pile-fabric looms	383,925	May 29	2923	773	43	1169
Pearson, William E., Saugus, assignor to G. M. Swasey, Boston, Mass. Rotary liquid-meter	380,764	Apr. 10	697	193	43	148
Pease Furnace Company, J. F. (See Warner and Austin, assignors.)						
Peay, Walter W., Toronto, Ontario, Canada. Trap for wells	381,577	Apr. 24	1982	506	43	499
Peck, Charles F. (See Tesla, Nikola, assignor.)						
Peck, Eugene H. (See Jones and Peck.)						
Peck, Joseph W., assignor to Z. Parmenter, Waltham, Mass. Machine for the manufacture of crayon pencils	381,810	Apr. 24	2250	588	43	473
Peckham Car Wheel Company. (See Richards, William G., assignor.)						
Peckham, Merritt, Utica, N. Y. Heating-stove	383,144	May 22	1897	494 495 496	43	905
Peckover, James, Philadelphia, Pa. Stone-saw	381,811	Apr. 24	2253	589	43	473
Pedrick, Knott H., Lynn, assignor of one-fourth to F. H. Safford, Newburyport, Mass. Faucet	384,886	June 19	1540	400	43	1409
Peerless Button Hole Attachment Company. (See Johnson, Albert W., assignor.)						
Peerless Reaper Company. (See Sloats, Albertice O., assignor.)						
Peirce, Arthur H., Chicago, Ill. Seal-lock	384,089	June 5	340	96	43	1185
Peirce, Ira C., Hyde Park, Mass. Mechanism for operating sliding doors	380,690	Apr. 10	585	161	43	197
Pellant, Frank E., Janesville, Wis. Cigar-machine	381,812	Apr. 24	2254	589	43	474
Pellieger, George, Akron, Ohio. Fountain-pen	381,417	Apr. 17	1679	450	43	344
Pelton, Russell K., Cleveland, Ohio. Invalid-bed inflating and heating apparatus combined	384,274	June 12	651	175	43	1256
Pendleton, John M., New Brighton, N. Y. Electric accumulator	380,765	Apr. 10	698	193	43	149
Peninsular Novelty Company. (See Vinton, John H., assignor.)						
Pennington, John C., Paterson, N. J. Preparing paper for wrapping metallic articles to prevent tarnishing, &c	380,515	Apr. 3	322	.....	43	66
Pennock, William H., assignor of one-half to J. W. Derrickson, Mermaid, Del. Spring bed-bottom	384,590	June 12	1120	296	43	1341
Pennsylvania Globe Gas Light Company. (See Bridge, Lewis, assignor.)						
Pentlarge, Rafael, Brooklyn, N. Y. Bushing for bangs	384,367	June 12	894	214	43	1295
Pequinot, Joseph C., Fort Wayne, Ind. Scraper	385,003	June 26	1743	451	43	1479
Percival, David C. (See Merrill and Percival.)						
Percy, William N. (See Bringold, John H., assignor.)						
Perine, Aaron B., Topeka, Kans. Thill-coupling	382,381	May 8	762	193	43	664
Perkins, Charles G., Hartford, Conn. Electric cut-out	385,067	June 26	1851	473	43	1500
Perkins, Charles G., and J. Tregoning, Hartford, Conn. Electric cut-out	380,706	Apr. 10	699	193	43	149
Perkins, Elijah H., Visalia, Cal. Rivet-burr remover	385,133	June 26	1945	497	43	1320
Perkins, Frank H. (See Miller, Louis L., assignor.)						
Perkins, George H., Philadelphia, Pa. Box for filling cans with oil or other liquids	382,979	June 5	295	60	43	1160
Perkins, George H., Philadelphia, Pa. Device for testing the physical condition of liquids at given temperatures	383,980	June 5	296	60, 61	43	1160
Perkins, George H., Philadelphia, Pa. Machine for filling cans	383,981	June 5	297	61 62 63	43	1160
Perkins, Hasen H., Kewanee, Ill. Hanking-pin	380,516	Apr. 3	323	92	43	66
Perkins, William C., Sandy Point, Me. Wrench	384,467	June 12	928	241	43	1306
Perkins, Willis J., Grand Rapids, Mich. Shingle-sawing machine	380,746	Apr. 3	53	19, 20	43	13
Perrigo, Albert S. (See Whiteley and Perrigo.)						
Perrigo, Oscar E. (See Whiteley and Perrigo.)						
Perrin, C. L., *et al.* (See Young, Thomas J., assignor.)						
Perrin, Charles, assignor of one-third to C. E. Meyer, Springfield, Ohio. Universal joint	384,388	June 12	896	214	43	1295
Perrin, John O. (See Erb, Fred, Jr., assignor.)						
Perrine, Alfred T., Providence, R. I., assignor to A. H. Reeder, Cincinnati, Ohio. Shoe or glove fastener	382,782	May 29	2819	742	43	1669
Perry, Francis H., assignor to C. J. Webb and M. B. Perry, Philadelphia, Pa. Coal-sifter	383,412	May 22	2240	609	43	977
Perry, Isaac A., Wilmington, Del. Railway-frog	380,923	Apr. 10	925	240	43	191
Perry, John R., Wakefield, R. I. Stamp for canceling, &c	383,487	May 29	2418	642	43	1666
Perry, Judson D., Detroit, Mich. Potato-digger	383,488	May 29	2419	642	43	1666
Perry, Maggie R., *et al.* (See Perry, Francis H., assignor.)						
Perry, Thomas O., Tecumseh, Mich. Pneumatic water-elevator	382,324	May 8	668	169	43	646
Perry, Thomas O., Tecumseh, Mich. Pneumatic water-elevator	382,727	May 15	1280	336	43	774
Perry, William C., Charlestown, R. I. Vehicle-spring	384,781	June 19	1401	366	43	1405
Persius, Rudolf, Aachen, Prussia, Germany. Dyeing apparatus	384,369	June 12	897	215	43	1296

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drs.	Official Gazette. Vol.	Official Gazette. Page.
Peters, Daniel, Cincinnati, Ohio. Egg-beater	383,489	May 29	2429	649	43	1686
Peters, Fridrich H. A., Detroit, Mich. Hoisting-machine	382,436	May 8	835	214	43	679
Peters, G. Moore, Xenia, Ohio. Cartridge	380,689	Apr. 10	864	161	43	127
Peters, G. Moore, Xenia, Ohio. Cartridge-loading machine	383,905	June 5	85	24, 25, 26, 27	43	1137
Peters, George W., Lancaster, Ohio. Button-hole cutter	384,710	June 19	1369	542	43	1398
Peters, John. Pottstown, Pa. Adjustable clevis	381,578	Apr. 24	1963	567	43	409
Peters, Richard G., Manistee, Mich. Discharge mechanism for vacuum-pans	384,070	June 5	241	96	43	1135
Peters, Richard G., Manistee, Mich. Discharge mechanism for vacuum-pans	384,071	June 5	242	96	43	1136
Peters, William F., assignor of one-half to Alpine Safe Company, Cincinnati, Ohio. Permutation-lock	384,468	June 12	929	241	43	1306
Petersen, Henry, assignor of one-half to C. Andriesen, St. Louis, Mo. Sectional pedestal-grate	382,583	May 8	1027	262	43	715
Petersen, Niels, Copenhagen, Denmark. Machine for grooming animals	380,934	Apr. 10	937	249	43	192
Peterson, Albert, Detroit, Mich. Lock for bags or satchels	382,788	May 15	1248	336	43	774
Peterson, George W., Leonardville, Kans. Block-signal	382,053	May 1	208	70, 71	43	582
Peterson, William F. (See Caldwell and Peterson.)						
Petry, Peter, Newark, N. J. Pencil-sharpener	382,437	May 8	836	214	43	678
Pettee Machine Works. (See Sheridan, James, assignor.)						
Pettigrew, Charles, *et al.* (See Trent, Francis H., assignor.)						
Petze, H. Hermann, *et al.* (See Schiller, Frederick W., assignor.)						
Pfister, John G., Buffalo, N. Y. Pipe-coupling	382,107	May 1	344	91	43	576
Pflüger, Albert. (See Meehring and Pflüger.)						
Pheatt, Gideon K., Toledo, Ohio. Oar and oar-lock	380,944	May 22	2036	534	43	933
Phelps, Charles H., Chicago, Ill. Oil-burner	384,275	June 12	653	175	43	1255
Phelps, Charles H., assignor to Gibson, Pariah & Company, Chicago, Ill. Machine for cutting disks from wood	381,947	May 1	68	17	43	398
Phelps, George H., *et al.* (See Preston, Charles A., assignor.)						
Phelps, George M., Brooklyn, assignor to Western Union Telegraph Company, New York, N. Y. Microphone-transmitter	380,925	Apr. 10	938	250	43	192
Phelps, Homer L., Athens, Pa. Bearing for street-cars	384,782	June 19	1402	397	43	1405
Phelps, James L., Meadville, Pa. Fruit-drier	383,845	May 22	2026	534, 535	43	933
Philadelphia Novelty Manufacturing Company. (See Heysinger, Isaac W., assignor.) (Reissue.)						
Philbey, Abel. (See Tolhurst, Glasbrook, Philbey, and Lockerbie.)						
Phillon, George, assignor to Dodge Manufacturing Company, Mishawaka, Ind. Upright-saw machine	383,946	May 22	2040	535	43	933
Phillon, George, assignor to Dodge Manufacturing Company, Mishawaka, Ind. Turning-lathe	383,309	May 22	2217	588	43	965
Phillips, Charles F. (See Phillips, William L., assignor.)						
Phillips, Cornelius J., New York, N. Y. Combined plug and ferrule for wash-tray connections	383,982	June 5	213	63	43	1162
Phillips, Elwood C., Richmond, Ind., assignor to A. Warren, St. Louis, Mo., and J. W. March, Cincinnati, Ohio. Tension apparatus	380,347	Apr. 3	92	21	43	15
Phillips, Emory, and A. N. Edwards, Wichita, Kans. Harness-rack	383,961	June 5	214	63	43	1162
Phillips, Hiram, Columbia, assignor to Kirtley & Phillips, Boone County, Mo. Envelope-tablet	385,390	June 26	2230	571, 572	43	1577
Phillips, James, Washington, Iowa. Castrating-instrument	384,215	June 5	553	152	43	1228
Phillips, John O., assignor of one-half to B. H. Dorman, Lynn, Mass. Embroidering-machine	382,619	May 8	1126	290, 291	43	735
Phillips, Marshman H., Verschoyle, Ontario, Canada. Nut-lock	382,654	May 1	989	71	43	563
Phillips, Selah, Arnot, Pa. Fish-plate	383,765	May 29	2230	762	43	1069
Phillips, William L., assignor to C. F. Phillips, Brooklyn, N. Y. Bed-bottom	381,948	May 1	69	17, 18	43	398
Phillips, William R., Milford, Del. Apparatus for bleaching	384,457	June 19	1541	409	43	1430
Phipps, Edward H., New Haven, Conn. Joint for cement-lined pipes	383,413	May 22	2291	606	43	977
Phipps, Thomas L., and W. Burman, Ryland Road, Edgbaston, near Birmingham, county of Warwick, England, assignors to L. S. Lee, Philadelphia, Pa. Hair-clipper. (Reissue)	10,931	May 15	1624	477	43	899
Piatt, William M., assignor of one-third to B. P. Runkle, Mac-o-chee, Ohio. Grain-binder	384,072	June 5	243	96, 97	43	1136
Pickering, Leander P., Rochester, assignor of one-fourth to F. W. Yeaton, Concord, N. H. Carpenter's framing-gage	385,321	June 26	2222	572	43	1577
Pickhardt, Emile, Islington, Mass. Button-loop and safety-pin	384,630	June 19	1195	316	43	1364
Pickles, James D., Manchester, Conn., and W. F. Pickles, Lafayette, Pa. Suction-box for paper-making machines	384,276	June 12	454	175	43	1255
Pickles, John, Bingley, and H. W. Whitehead, Leeds, county of York, England. Combing-machine	384,783	June 19	1405	397, 398	43	1406
Pickles, William F. (See Pickles, James D. and W. F.)						
Picon, Alexis. (See Babin, Telesphore, assignor.)						
Pidduck, George A., Englewood, Ill. Street-indicator for cars	382,769	May 15	1335	351	43	785
Pietetieker, Carl M., London, county of Middlesex, England. Machine for drawing rods and tubes	382,729	May 15	1284	336	43	775
Pierce, Charles, Monticello, Iowa. Belt-tightener	382,007	May 1	185	48	43	548
Pierce, Ray V. (See Smith, Elmer S., assignor.)						
Pierpont, Louis E., Cambridge, Nebr. Vapor-burner	380,404	Apr. 3	144	41	43	30
Piffard, Henry G., New York, N. Y. Photogenic cartridge	383,984	June 5	215	64	43	1162
Piffard, Henry G., New York, N. Y. Photogenic powder	384,927	June 19	1630		43	1415
Pigeon, Charles J., and L. J. T. Lacroix, Paris, France. Tubular floating mattress	381,813	Apr. 24	2256	559, 560	43	474
Pigott Time and Fare Register Company. (See Pigott, William, assignor.)						
Pigott, William, assignor to Pigott Time and Fare Register Company, Chicago, Ill. Fare-register	383,008	May 15	1672	437, 438	43	852
Pihl, Carl G. A. F. W. E., Lowell, Mass. Window-reflector	384,784	June 19	1406	398	43	1406
Pike, Edward M., J. Castle, and J. B. Schopp, Chenoa, Ill. Frame for brick-kilns	384,469	June 12	930	242	43	1306
Pike, James E., Plymouth, Ind. Foot-rest	383,906	June 5	92	27	43	1128
Pilliod, Charles J., assignor of one-half to H. S. Bassett, Swanton, Ohio. Automatically-adjustable feed device	383,145	May 22	1880	496	43	965
Pillsbury, Samuel G., assignor of one-half to A. V. Whitcomb, Long Island, Kans. Corn-sheller	380,767	Apr. 10	761	194	43	149
Pilood, David W., Weelder, Tex. Combined cotton chopping, planting, and cultivating machine	383,149	May 22	1901	496	43	966
Pinch, Frank, Sidney, assignor to Excelsior Metallic Packing Company, Middletown, N. Y. Red-packing	382,187	May 1	459	117	43	586

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drs.	Official Gazette. Vol.	Official Gazette. Page.
Pine, Reuben M., Columbia City, Ind. Machine for sharpening saws	383,004	June 26	1745	451	43	1489
Pinelta, José, assignor to H. Grote, Guatemala, Guatemala. Removing fusel-oils from crude spirits	384,668	June 19	1542		43	1430
Pinkney, Charles W., Smethwick, county of Stafford, England. Hammering machinery actuated by explosive gaseous mixtures	384,889	June 19	1543	401, 402	43	1430
Pinkowski, Friedrich. (See Klinik, Pinkowski, and Gross.)						
Pinkowski, Friedrich. (See Klinik, Pinkowski, and Sellmann.)						
Piper, Edwin S., assignor of one-half to S. E. Root, Bristol, Conn. Rotary nozzle-head for water-motors	380,021	Apr. 10	596	161	43	127
Piper, John H., Brooklyn, N. Y. Nut-lock	380,896	Apr. 10	941	250	43	193
Piper, William M., assignor of two-thirds to S. Newborn and C. W. Wolfendale, Allegheny City, Pa. Glass-blowing apparatus	381,887	Apr. 24	2388	621	43	489
Pitrat, Julius E., Gallipolis, Ohio. Weighing and price scale	385,005	June 26	1748	451, 452	43	1489
Pitt, William A., Glenbrook, Conn. Means and apparatus for collecting and separating sewage	382,188	May 1	451	116	43	527
Pitt, William A., Glenbrook, Conn. Crank and lever motion	382,189	May 1	454	116	43	527
Pitt, William A., Glenbrook, Conn. Steam-engine for equalizing power	383,764	May 29	2221	743	43	1069
Pitts, Andrew J. and G. W., assignor of one-half to J. G. and C. C. Hudson, De Armanville, Ala. Fence	382,382	May 8	763	194	43	664
Pitts, George W. (See Pitts, Andrew J. and G. W.)						
Pitts, Thomas W., Wolsey, Dak. Ter. Pneumatic railway	384,333	June 12	744	195	43	1270
Pittsburgh Forge and Iron Company. (See Wilson, John T., assignor.)						
Plankinton, William. (See Johnson, Warren S., assignor.)						
Plache, James F., Watertown, N. Y. Crutch	384,470	June 12	931	243	43	1306
Plumb, Bardlet & Barnard. (See Johnson, Henry J., assignor.)						
Plumb, William H., Lake City, Colo., assignor of one-half to P. P. Dickinson, New York, N. Y. Apparatus for heating railway-cars	383,247	May 22	2041	535	43	934
Pneumatic Dynamite Gun Company. (See Pratt, Nat. W., assignor.)						
Pneumatic Gate Company. (See Mills, Mortimer B., assignor.)						
Poh, Benjamin W., assignor to himself and P. Steingoetter, Buffalo, N. Y. Pipe-coupling	384,073	June 5	245	97	43	1136
Poirrier, Alcide F., and D. A. Rosenstiehl, assignors to Société Anonyme des Matières Colorantes et Produits Chimiques de St. Denis, Paris, France. Production of azo colors	380,927	Apr. 10	943		43	193
Poirrier, Alcide F., and Z. Roussin, assignors to Société Anonyme des Matières Colorantes et Produits Chimiques de St. Denis, Paris, France. Production of diazoic coloring-matters	380,998	Apr. 10	945		43	193
Poland, Lawrence N. P., Cincinnati, Ohio. Dynamo-electric machine	383,330	May 22	2150	547	43	953
Pole, Benjamin C., Camden, N. J. Motor for street-railways	381,847	Apr. 24	2327	604, 605	43	487
Pole, Benjamin C., Camden, N. J. Steam or gas motor engine	382,008	May 1	186	48, 49	43	548
Polhemus, Benjamin F. (See Polhemus, James H. and B. F.)						
Polhemus, James H. and B. F., Brooklyn, N. Y. Spokeshave	383,509	May 29	2357	676	43	1038
Pollock, Alexander, Nyack, N. Y. Switch-lock	383,654	May 29	2049	701	43	1056
Pomeroy, Henry N., assignor to J. A. Warner, Sparta, Wis. Dust-collector	381,630	Apr. 24	2012	528	43	427
Pomroy, John R., assignor of one-half to R. J. Townley, Belvidere, Ill. Pavement	381,674	June 5	246		43	1137
Pond, Alexander W. (See Camfield, Patrick E., assignor.)						
Pond, Chester H., Brooklyn, N. Y. Circuit-closing device for electric clocks	383,655	May 29	2050	701	43	1056
Pond, Lucius W., and F. E. Norton, assignors to H. C. Fish, Worcester, Mass. Metal-planing machine	380,692	Apr. 10	587	162	43	127
Pope, Harry M., Hartford, Conn., assignor to Pope Manufacturing Company, Portland, Me. Velocipede-seat	381,165	Apr. 17	1321	353	43	273
Pope, Harry M., assignor of one-half to D. S. Seymour, Hartford, Conn. Breech-loading fire-arm	384,277	June 12	655	176	43	1256
Pope, James M., assignor of part to R. W. Garrison, Canton, and W. C. Joyner, Madison County, Miss. Combined planter and fertilizer-distributer	380,929	Apr. 10	946	250, 251	43	193
Pope Manufacturing Company. (See Knous, John, assignor.)						
Pope Manufacturing Company. (See Latin, Emmit G., assignor.)						
Pope Manufacturing Company. (See Pope, Harry M., assignor.)						
Popham, Richard M., *et al.* (See Powell, John B., assignor.)						
Peppert, George, Milwaukee, Wis. Blind-rod for sliding blinds	380,930	Apr. 10	948	251	43	194
Porter, Annie G., *et al.* (See Porter, Henry K., assignor.)						
Porter, Clinton J., Bowling Green, Ky. Corn splitting and cutting machine	382,108	May 1	345	91	43	577
Porter Drop Cabinet Company. (See Porter, William H., assignor.) (Reissue.)						
Porter, H. W., *et al.* (See Harris, Noah, assignor.)						
Porter, Henry K., Boston, assignor of one-half to A. G. and T. W. Porter, Chelsea, Mass. Extension-tool for planers	382,268	May 1	572	145	43	619
Porter, John C., New York, N. Y. Folding cot	383,985	June 5	216	64	43	1162
Porter, T. W., *et al.* (See Porter, Henry K., assignor.)						
Porter, William H., Washington, D. C., assignor to Porter Drop Cabinet Company, New York, N. Y. Combined desk and type-writer cabinet. (Reissue)	10,924	Apr. 24	2405	625	43	504
Post, Charles A., New York, N. Y. Rig and gear for gaff-topsails	381,278	Apr. 17	1477	397	43	393
Postlethwaite, Miles, Whitehaven, county of Cumberland, England. Ventilated hat	385,282	June 26	2172	554, 555	43	1506
Potter, Edward R., Grinnell, Iowa. Wire gate	380,591	Apr. 3	429	122	43	88
Potter, James R., Providence, R. I. Automatic car-switch	381,949	May 1	71	18	43	598
Potter, Roger. (See Murphy, Thomas J., assignor.)						
Potter, William, Stockton, Kans. Grapple	380,405	Apr. 3	145	41	43	30
Potter, Wilson L., assignor to Jewell Belting Company, Hartford, Conn. Belt-fastener	381,640	Apr. 24	2012	528	43	427
Potts, Edward C. (See Perse, Alfred E., assignor.) (Reissue.)						
Potts, George, Indianapolis, Ind. Clay-disintegrator	384,278	June 12	656	176	43	1256
Poulton, John F. (See Hilleary and Poulton.)						
Powell, John B., assignor of one-fourth to D. D. Dieterich and R. M. Popham, Philadelphia, Pa. Spring-motor	382,663	May 8	1190	300	43	748
Powell, Samuel, Ravenswood, assignor to Keen & De Lang, Chicago, Ill. Paper-holding spindle	380,592	Apr. 3	431	122	43	88
Powell, William L., Kansas City, Mo. Door-hanger	382,770	May 15	1337	352	43	795
Power, George T. (See Messinger, William T., assignee.)						
Powers & Son, William T. (See Densmore, Edwin, assignor.)						
Perbes, Josiah, assignor, by mesne assignments, to C. R. Vincent, New York, N. Y. Weather-strip	381,166	Apr. 17	1322	353	43	273
Prall, William E., Washington, D. C., assignor, by mesne assignments, to National Heating Company, New York, N. Y. Means for supplying heat and steam or water power to cities, towns, &c. (Reissue)	10,923	Apr. 17	1842	487	43	376

Pratt, Nat. W., Brooklyn, N. Y. Apportioning furnace-draft for batteries of steam-boilers	382,490	May 8	938	235	43	665
Pratt, Nat. W., Brooklyn, assignor to Pneumatic Dynamite Gun Company, New York, N. Y. Pneumatic ordnance	381,950	May 1	72	18	43	598
Pratt, Oscar C., San Rafael, Cal. Seal-lock	384,542	June 12	1051	274	43	1324
Pratt, Robert J., Greenbush Heights, N. Y. Drill-chuck	384,928	June 19	1620	421	43	1445
Pratt, Rufus N., Hartford, Conn., and H. W. Johns, New York, N. Y. Boot or shoe	381,579	Apr. 24	1924	507	43	469
Pratt, Samuel B., Boston, Mass. Tray for collecting coin	384,711	June 19	1308	342	43	1346
Prengel, Eugen, deceased, Oakland, Cal.; H. G. Prengel executrix. Hay-press	382,664	May 8	1192	310	43	748
Prengel, Helena G., executrix. (See Prengel, Eugen.)						
Prentice, George W., Providence, R. I. Button-machine	383,490	May 29	2421	643	43	1009
Prentice, Henry L. (See Hard, Josiah, assignor.)						
Prentice, John, New York, N. Y. Cock for gas-fixtures	385,134	June 26	1946	497	43	1520
Prescott, James E., assignor of one-half to J. W. Reynolds, Waynesborough, Ga. Axle for vehicles	383,066	May 15	1777	459	43	872
Pressley, Leonidas C., assignor to Automatic Connection Compressed Air Car Motor Company, San Francisco, Cal. Automatic air-supply for propelling cars	383,896	May 29	2994	772	43	1169
Preston, Charles A., Cambridgeport, assignor to G. Frost, G. H. Phelps, and G. A. Frost, Newton, Mass. Garment-supporter	383,827	May 29	2926	773	43	1169
Preston, E. Bruce. (See Bruegger, Abraham, Jr., assignor.)						
Preston, Edward F. (See Preston, William W. and E. F.)						
Preston, Everett B. (See Adcock, Edmund, assignor.)						
Preston, Everett B. (See Hicks, Charles, assignor.)						
Preston, Everett B., Chicago, Ill. Turn-table extension-ladder truck	383,828	May 29	2927	773 774	43	1169
Preston, Frederick L., Darien, Wis. Breaker and crusher	383,986	June 5	216	64, 65	43	1102
Preston, Henry M., New Haven, Conn., assignor to E. Burdsall, Port Chester, N. Y. Drill-chuck	383,948	May 22	2042	536	43	934
Preston, William W. and E. F., Bismarck, Mich. Ice-creeper	380,816	Apr. 10	769	210	43	161
Prewitt, David H., Perryville, Ky. Bundle-carrier for harvesters	383,009	May 15	1185	458	43	854
Price, Abel F., Philadelphia, Pa. Bicycle	384,543	June 12	1052	275	43	1328
Price, Henry C., assignor of one-third to J. H. Hildreth, New York, N. Y. Clothes-drier	382,969	May 1	573	145	43	619
Price, John A., Scranton, Pa. Heating-stove	381,096	Apr. 10	1091	290 291	43	220
Price, Orrin J., Detroit, Mich. Soda-water-dispensing apparatus	381,097	Apr. 10	1095	291	43	221
Price, William H., Jr., assignor to Chandler & Price, Cleveland, Ohio. Ink-fountain for platen printing-presses	384,216	June 5	554	152	43	1228
Price, William L., Philadelphia, Pa. Rolling apparatus	384,581	June 12	1122	286	43	1341
Prichard, Frank E., Cedar Falls, Iowa. Electrical governor	380,817	Apr. 10	770	211	43	161
Pridmore, Henry E., assignor to McCormick Harvesting Machine Company, Chicago, Ill. Grain-binder	382,898	May 15	1511	396	43	821
Pridmore, Henry E., assignor to McCormick Harvesting Machine Company, Chicago, Ill. Wheel	382,899	May 15	1513	396	43	822
Pringle, Eugene, Gloversville, N. Y. Glove-fastening	380,694	Apr. 10	500	162	43	128
Pringle, William J., Cleveland, Ohio. Brick or tile for building purposes	383,987	June 5	218	65	43	1163
Prins, Faustin, Milwaukee, Wis. Smut-machine	380,348	Apr. 3	63	21, 22	43	15
Prins, Faustin, Milwaukee, Wis. Elevating-bolt	381,848	Apr. 24	2330	605	43	467
Prip, Axel. (See Ostermann and Prip.)						
Pritchard, Frederick, Meriden, Conn. Octave-coupler	381,416	Apr. 17	1680	450	43	345
Prochowics, Albert, Winona, Minn. Ointment	381,483	Apr. 17	1783	.....	43	364
Prout, Joseph A., New York, N. Y. Cock	382,900	May 15	1514	396	43	822
Prouty, Jonas R. (See Avery, William, assignor.)						
Prouty, Jonas R., Spencer, Mass. Nail-strip	381,907	June 5	93	28	43	1138
Prouty, Jonas R., Spencer, Mass. Nail-strip	381,908	June 5	94	28	43	1138
Prouty, Jonas R., Spencer, Mass. Pegging-machine	381,909	June 5	95	28	43	1139
Prouty, Jonas R., Spencer, Mass. Machine for loading nail-strips	381,910	June 5	96	28 29	43	1139
Pruden, Samuel M., Newark, N. J. Electrical registering device	381,279	Apr. 17	1478	397	43	303
Pruitt, Eugene R., assignor of one-half to C. W. Johnson, Baltimore, Md. Safety attachment for gas-burners	381,484	Apr. 17	1784	475	43	364
Puchta, Emil, and R. Hoffmann, Washington, Mo. Tile-machine	381,591	May 29	2559	677	43	1096
Puffenberger, Henry B., Tiffin, Ohio. Corn-shock binder and compressor	384,279	June 12	658	176	43	1256
Puffer, Freeman W. (See Greene, Webster M., assignor.)						
Puffer, Stephen, Oxford, N. Y. Vehicle-wheel	381,509	Apr. 17	1826	483	43	372
Pugh, Cortes V., assignor to W. A. Hutchinson, Bowling Green, Mo. Wire-stretching machine	384,929	June 19	1622	421	43	1446
Pullman, George M., Chicago, Ill. Railway-car	383,067	May 15	1779	460	43	872
Pullman's Palace Car Company. (See Sessions, Henry H., assignor.)						
Purdy, Elbridge H., Cincinnati, Ohio. Car-brake	381,064	Apr. 10	1201	321	43	211
Purdy, Hiram, Burlington, Iowa. Reflector for electric lamps	381,167	Apr. 17	1323	353	43	274
Putman, John, assignor to M. A. Putman, Boardstown, Ill. Draft-equaliser	380,635	Apr. 3	488	137	43	99
Putman, Martha A. (See Putman, John, assignor.)						
Quarante, Pierre L., and E. D'Escalonne, Paris, France. Composition for preserving wood, &c.	380,393	Apr. 3	432	.....	43	88
Queateil, William P., Kansas City, Mo. Can-opener	380,406	Apr. 3	146	41	43	30
Quigg, George B., Thornton, assignor to himself and J. N. Young, Chicago, Ill. Car-brake	383,994	June 5	81	24	43	1137
Quigley, Robert J., Toronto, Ontario, Canada. Watch-case	382,190	May 1	455	118	43	597
Quigley, Robert J., Toronto, Ontario, Canada. Watch-case	384,640	June 19	1196	316	43	1354
Quilliam, Albert L., Chateaugray, N. Y. Mower	384,712	June 19	1309	342	43	1346
Quine, William W. (See Schleber, Henry H., assignor.)						
Quinn, James, Jr., assignor to W. Wharton, Jr., and Company, Philadelphia, Pa. Rail-chair	383,765	May 29	2988	743	43	1089
Quinn, Thomas J., and D. McLellan, Woodstock, Ontario, Canada. Device for checking horses	381,580	Apr. 24	1925	507	43	469
Quris, Nicolas, Kirchberg-on-the-Wechsel, Lower Austria, Austria-Hungary. Belt-coupling	380,695	Apr. 10	502	162	43	128

Randall, James D. (See Randall, Silas H., assignor.)						
Randall, Richard N., *et al.* (See Heath, Watson A., assignor.)						
Randall, Silas H., assignor of one-half to J. D. Randall, Wyoming, Ohio. Leather-creasing machine	381,029	Apr. 10	1098	292	43	221
Randleman, Martin C. (See Randleman, Zouave S. and M. C.)						
Randleman, Zouave S. and M. C., Carlisle, Iowa. Hay and fodder fork	384,281	June 12	660	177	43	1256
Randol, Harriet, Pottersburg, Kans. Provision-safe	381,721	Apr. 24	2134	559	43	451
Rank, George, Salem, Ohio. Harness-saddle	381,952	May 1	75	19	43	599
Ransom Stove Company. (See Rathbone, Clarence, assignor.)						
Rapp, Aaron. (See Richardson and Rapp.)						
Rappold, Peter. (See Flaher and Rappold.)						
Rarlon, William. (See Snow and Howard, assignors.)						
Rathbone, Clarence, assignor to Ransom Stove Company, Albany, N. Y. Cook-stove	385,135	June 26	1947	497	43	1521
Rathmann, Christian. (See Rathmann, George D. and C.)						
Rathmann, George D. and C., Blair, Nebr. Railway-crossing alarm-signal	384,390	June 12	827	215	43	1286
Rau, John, Belleville, Ill. Oven for cooking-stoves	383,147	May 22	1903	497	43	906
Rau, John, St. Louis, Mo. Oil-can	383,370	May 22	2218	568	43	965
Rau, John, assignor of one-half to A. F. Klotsbach, Belleville, Ill. Fan attachment for cradles	382,386	May 8	769	195	43	665
Rauch, Edward C. (See Saunders and Rauch.)						
Rautert, Fritz. (See Buschick and Rautert.)						
Rawson, Edmund G. (See Rhodes, Stephen E., assignor.)						
Ray, Sevrin, Alderley, Wis. Grain-divider	383,542	May 29	2505	661	43	1024
Raymond, Freeborn F., 2d, Newton, Mass. Nail making and distributing machine	380,596	Apr. 3	438	123 124	43	89
Raymond, Freeborn F., 2d, Newton, Mass. Nail making and distributing machine	380,818	Apr. 10	772	211	43	162
Raymond, Freeborn F., 2d, Newton, Mass. Machine for making, distributing, and driving nails	381,980	Apr. 17	1480	397 398	43	304
Raymond, Freeborn F., 2d, Newton, Mass. Nail feeding and distributing machine	383,911	June 5	98	29	43	1139
Read, John H., San Francisco, Cal. Cartridge-loading apparatus	382,630	May 15	1416	372	43	801
Reade, Charles A., Chicago, Ill. Vehicle-wheel	381,722	Apr. 24	2135	559	43	451
Reams, Andrew J., Augusta, Kans. Electric winding attachment for clocks	384,472	June 12	932	242 243	43	1307
Reardo, Joseph M. (See White, William E., assignor.)						
Reckenzaun, Anthony, London, England, assignor to Electric Car Company of America, Philadelphia, Pa. Dynamo-electric machinery	385,008	June 26	1852	474	43	1500
Reckenzaun, Anthony, London, England, assignor to Electric Car Company of America, Philadelphia, Pa. Secondary battery	385,009	June 26	9041	522	43	1530
Redding, William A., New York, assignor to F. W. Snow, Hillburn, N. Y. Switch-stand	384,714	June 19	1312	343	43	1368
Reddy, James M., Chicago, Ill. Steam-washer	380,739	Apr. 10	643	178	43	138
Redick, Joseph H. (See Redick, Reubin F. and J. H.)						
Redick, Reubin F. and J. H., Spencerville, Ohio. Detachable-link chain	382,554	May 8	1028	262	43	716
Redick, Reubin F. and J. H., Spencerville, Ohio. Saw-mill dog	382,555	May 8	1029	262	43	716
Redington, William H. (See Redliger, William, assignor.)						
Redington, William H., Chicago, Ill. Bottle-stopper	382,191	May 1	456	118	43	598
Redman, Thomas, Bradford, England. Velocipede	385,136	June 26	1948	498	43	1521
Redmon, James J. (See Hardwicke and Redmon.)						
Reed, Charles F. (See Boehm and Reed.)						
Reed, Edward F. (See Howard, Robert W., assignor.)						
Reed, James D. S., assignor of one-half to W. G. F. Reed, Chicago, Ill. Road-scraper	383,668	May 15	1779	460	43	872
Reed, James H., Lynn, Mass. Cuff-holder	381,642	Apr. 24	2014	529	43	427
Reed, William G. F. (See Reed, James D. S., assignor.)						
Reed, William H. (See Harmon, Charles H., assignor.)						
Reeder, Allen H. (See Perrine, Alfred T., assignor.)						
Rees, Thomas M., Pittsburg, Pa. Securing stanchions of vessels in place	382,630	May 8	1130	291	43	735
Reese, Abram, assignor to Reese Safety Brake Company, (limited,) Pittsburg, Pa. Car-brake	385,007	June 26	1750	453	43	1481
Reese, Charles D. (See Wallace and Reese.)						
Reese, Jacob, Pittsburg, Pa. Metallic railway-tie	384,785	June 19	1406	368	43	1406
Reese Safety Brake Company. (See Reese, Abram, assignor.)						
Reese, Thomas, Jr., Erie, Pa. Furnace bridge-wall	382,109	May 1	347	91	43	577
Reese, Zach J., *et al.* (See Ruteredo, John, assignor.)						
Reeves, Paul S., Philadelphia, Pa. Hand-charger for combining metals with chemicals, minerals, &c.	384,675	June 5	346	96	43	1187

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drgs.	Official Gazette. Vol.	Official Gazette. Page.
Reeves, Thomas H. (See Milburn, George E., assignor.)						
Regester & Sons, J. (See Dunnett, William D., assignor.)						
Rehfuss, George. (See Beasley and Rehfuss.)						
Rehfuss, George, J. G., and M. O., Philadelphia, Pa., assignors to American Barrel and Stave Company, Camden, N. J. Barrel-making machine	380,931	Apr. 10	949	251, 252	43	194
Rehfuss, George, J. G., and M. O., Philadelphia, Pa., assignor to American Barrel and Stave Company, Camden, N. J. Barrel-stave-cutting machine	384,786	June 19	1407	368, 369, 370	43	1406
Rehfuss, J. George. (See Beasley and Rehfuss.)						
Rehfuss, John G. (See Rehfuss, George, J. G., and M. O.)						
Rehfuss, Martin O. (See Beasley and Rehfuss.)						
Rehfuss, Martin O. (See Rehfuss, George, J. G., and M. O.)						
Reichart, Adam, *et al.* (See Henry, Charles A., assignor.)						
Reichenbach, Edward, Orrville, Ohio. Ditching-level	383,767	May 29	2825	744	43	1080
Reichenbach, Jacob J., Centralia, Ill. Display-frame	384,334	June 12	745	195, 196	43	1270
Reid & Co., James. (See Durell and Goldie, assignors.)						
Reid, Robert B. (See Donaldson, Walter H., assignor.)						
Reid, W. C. (See Larew, William H., assignor.)						
Reilly, Christopher P., New York, assignor of two-thirds to T. F. Ryder, West New Brighton, N. Y. Protector for electric-lamp sockets	382,110	May 1	346	91	43	577
Reilly, Patrick. (See Fox, Edward, assignor.)						
Reimers, Henry, Perry, Tex. Fire-escape	383,491	May 29	2422	643	43	1089
Rein, Burnard, assignor of one-half to J. Halteman, Detroit, Mich. Vapor-stove	384,391	June 12	889	215, 216	43	1286
Reinhard, Henry A., Columbus, Ohio. Inkstand	382,621	May 8	1131	291	43	735
Reinhardt, Louisa, Louisville, Ky. Washing-machine	381,643	Apr. 24	2015	529	43	928
Reininghaus, Gustav, Mayence, Hesse, Germany. Malt-kiln	385,137	June 26	1949	488, 489	43	1521
Reinisch, Charles, Newark, N. J. Shoe for traveling-bags	380,768	Apr. 10	702	184	43	149
Reinisch, Charles, Newark, N. J. Hinge for traveling-bags, &c	385,138	June 26	1950	499	43	1521
Reinohl, David C. (See Scott, William H., assignor.)						
Reins, William S. (See Seal, William B., assignor.)						
Reis, John, Rondout, N. Y., assignor of one-half to Brewers Ice Company, of New York. Switch for ice-runs	381,419	Apr. 17	1681	450, 451	43	345
Reisse, Richard A., St. Louis, Mo. Door-check	384,715	June 19	1313	343	43	1397
Reitenour, Henry. (See Heniser, Nicholas, assignor.)						
Reitler, Charles W., Denver, Colo. Electric pen-holder	381,953	May 1	78	19	43	529
Remley, Fred A., Iowa City, Iowa. Type-writing machine	385,008	June 26	1752	453	43	1481
Remus, Theodor, assignor of one-half to J. Scherbel, Dresden, Saxony, Germany. Apparatus for applying strips to boxes	383,656	May 29	2652	702, 703	43	1057
Remus, Theodor, assignor of one-half to J. Scherbel, Dresden, Saxony, Germany. Grooving apparatus for card-board, leather, and like material	385,201	June 26	2042	522	43	1540
Rendel, George W., Newcastle-upon-Tyne, England. Mounting and loading apparatus for guns	383,768	May 29	2827	744, 745	43	1080
Rensland, Peter, and C. Fisher, Port Jervis, N. Y. Dumping-grate	382,055	May 1	270	71	43	583
Rensselaer Manufacturing Company. (See Hall, Henry, assignor.)						
Restein, Julius, Philadelphia, Pa. Device for operating churns, washing-machines, &c	383,610	May 15	1666	438	43	854
Reuter, Conrad, Henderson, Ky. Egg-tester	380,518	Apr. 3	394	92, 93	43	66
Rex, Alfred C. (See Parmelee, William L., assignor.)						
Rexford, Mortimer S., Norman, Dak. Ter. Intermittent gripping device	383,371	May 22	2219	589	43	965
Rexford, Mortimer S., Norman, Dak. Ter. Steam-boiler	384,716	June 19	1313	343, 344	43	1397
Reynolds, Edwin, Providence, R. I. Rubber stamp	380,349	Apr. 3	68	22, 23	43	16
Reynolds, Edwin, Providence, R. I. Rubber stamp	383,321	May 22	2151	568	43	953
Reynolds, Gilbert C., J. and W. Paterson, Stockton, Cal. Combined header and thrasher	381,723	Apr. 24	2136	559	43	452
Reynolds, Henry C., assignor of one-half to J. A. C. Groner, Norfolk, Va. Sash lock and fastener	381,485	Apr. 17	1766	476	43	364
Reynolds, John, Chicago, assignor to W. B. Gilbert Austin, Ill. Paper holder and cutter	381,281	Apr. 17	1482	398	43	304
Reynolds, John H., Troy, N. Y. Ventilator	383,502	May 29	2560	677	43	1036
Reynolds, John P., Jr. (See Mitchell and Reynolds.)						
Reynolds, John W. (See Prescott, James E., assignor.)						
Reynolds, Nelson G., Bangor, Mich. Sleigh	380,819	Apr. 10	775	212	43	169
Reynolds, Stephen H. (See Hood and Reynolds.)						
Reynolds, Walter S., assignor to himself, S. E. Bradt, and L. E. Tomblin, De Kalb, Ill. Piano-mover	383,190	May 22	1956	513	43	917
Reynolds, William W., Rutland, Vt. Scale-beam	383,912	June 5	100	30	43	1140
Rhea, J. S., *et al.* (See Lockett, John E., assignor.)						
Rhea, John W., *et al.* (See Lockett, John E., assignor.)						
Rhind, Frank, Meriden, Conn., assignor of one-half to C. S. Upton, New York, N. Y. Central-draft lamp and burner	382,270	May 1	575	145	43	619
Rhind, Frank, assignor of one-half to E. Miller & Company, Meriden, Conn. Lantern	382,831	May 15	1412	378	43	802
Rhind, Frank, assignor of one-half to E. Miller & Company, Meriden, Conn. Extension-lamp fixture	383,769	May 29	2829	745	43	1091
Rhind, Frank, assignor to E. Miller & Company, Meriden, Conn. Ornamented metallic surface	384,282	June 12	661	177	43	1257
Rhodes, Benjamin W. (See Bernard and Rhodes.)						
Rhodes, James B., Cheboygan, Mich. Saw-tooth swage	382,325	May 8	671	169	43	646
Rhodes, Stephen E., assignor of one-half to E. G. Rawson, Saratoga Springs, N. Y. Steam-radiator	381,954	May 1	78	20	43	529
Rhodes, Stephen E., assignor of one-half to E. G. Rawson, Saratoga Springs, N. Y. Radiator	381,955	May 1	80	20	43	530
Rhodes, Vernon, Memphis, Tenn. Cultivator	381,169	Apr. 17	1365	354	43	274
Ribble, George W., Harrisonburg, Va. Combination-tool	381,794	Apr. 24	2137	559	43	452
Rice, Alva C., assignor to Stilwell & Bierce Manufacturing Company, Dayton, Ohio. Horizontal thrust-bearing	384,930	June 19	1663	421	43	1446
Rice, David H., Brookline, assignor to J. Ferguson, Bridgewater, Mass. Steam-valve	380,661	Apr. 3	389	146, 147	43	109
Rice, David, H., Brookline, Mass., assignor to Marlin Fire Arms Company, Hartford, Conn. Extracting mechanism for revolvers	385,009	June 26	1754	454	43	1488
Rice, E. Wilbur, Jr., Lynn, Mass. Reactive coil	381,489	Apr. 17	1682	451	43	345
Rice, E. Wilbur, Jr., Lynn, Mass. Rheostat	383,913	June 5	101	30	43	1140
Rice, Fred, Shopiere, Wis. Wagon-brake	382,271	May 1	576	146	43	619
Rice, Gerrett S., deceased, Chicago, Ill.; S. Rice, administratrix. Music-chart	383,011	May 15	1667	439	43	864

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drgs.	Official Gazette. Vol.	Official Gazette. Page.
Rice, James, assignor of one-half to B. T. De Bean and J. M. Talbott, Prairie Creek, Ind. Railway-rail crossing	384,717	June 19	1315	344	43	1397
Rice, John S. (See Edson, Jacob, assignor.)						
Rice, Nathaniel B., Chicago, Ill. Evaporator	385,902	June 26	2043	523	43	1540
Rice, Sarah, administratrix. (See Rice, Gerrett S.)						
Ried, Stephen L., Scranton, Pa. Combined coat and pantaloons supporter	381,888	Apr. 24	2389	621	43	499
Richards, Francis H., Hartford, assignor to American Button Fastener Company, New Britain, Conn. Button-setting machine	381,030	Apr. 10	1099	292, 293	43	223
Richards, Francis H., Hartford, assignor to American Button Fastener Company, New Britain, Conn. Button-setting machine	381,031	Apr. 10	1103	294, 295	43	223
Richards, Frank H., Troy, N. Y. Centrifugal machine	384,718	June 19	1316	344	43	1397
Richards, Ivan W., Colora, Md. Lawn-mower	384,787	June 19	1411	370	43	1407
Richards, John, assignor of two-thirds to Z. J. Reese and J. D. Sinclair, Fort Worth, Tex. Chairs	382,387	May 8	770	195	43	985
Richards, Lovell A., Grayson, Cal. Disk harrow	382,731	May 15	1267	337	43	775
Richards, William G., Brooklyn, assignor to Peckham Car Wheel Company, New York, N. Y. Car-wheel	383,089	June 5	219	65	43	1163
Richardson, Benjamin F., Cincinnati, Ohio. Vehicle-axle	382,902	May 15	1516	397	43	893
Richardson, Benjamin P., Boston, Mass. Type-writer cabinet	383,492	May 29	2423	643	43	1089
Richardson, E. Jessie H., Detroit, Mich. Device for sprinkling lawns	385,069	June 26	1856	474	43	1502
Richardson, George, Masardville, Tex. Sheep-shearing machine	384,545	June 12	1054	275	43	1339
Richardson, John T., Harrisburg, Pa., and A. Rapp, Holland, N. J., assignors of one-third to A. H. Ege, Mechanicsburg, Pa. Rolling-mill	383,990	June 5	220	66	43	1163
Richardson, Leonard, *et al.* (See Leland, Edwin A., assignor.)						
Richardson Manufacturing Company. (See Parker, Gardner R., assignor.)						
Richardson, William S., Boston, Mass. Fastening for gloves	383,069	May 15	1781	460	43	878
Richardson, William S., Boston, Mass. Glove-fastening	383,070	May 15	1782	460	43	873
Richardson, William S., Boston, Mass. Fastening for gloves	383,071	May 15	1783	461	43	873
Richardson, William S., Boston, Mass. Fastening for gloves	383,072	May 15	1784	461	43	873
Richardson, William S., Boston, Mass. Glove-fastening	383,073	May 15	1785	461	43	873
Richardson, William S., Boston, Mass. Glove-fastening	383,074	May 15	1786	462	43	873
Richardson, William S., Boston, Mass., assignor to Ball and Socket Fastener Company, Nashua, N. H. Fastening for gloves	382,904	May 15	1519	397, 398	43	893
Richardson, William S., Boston, Mass., assignor to Ball and Socket Fastener Company, Nashua, N. H. Fastening for gloves	382,905	May 15	1520	398	43	893
Richardson, William S., Boston, and J. B. Chase, Newton, Mass., assignors to Ball and Socket Fastener Company, Nashua, N. H. Glove-fastening	382,903	May 15	1518	397	43	893
Richmond City Mill Works. (See Mawhood, Jonathan D., assignor.)						
Richmond, Gilbert M., Chicago, Ill., assignor, by mesne assignments, to L. A. Watson, Ashtabula, Ohio. Feather duster	385,070	June 26	1857	474	43	1502
Richmond, Jewett M., *et al.* (See Britton, William H., assignor.)						
Richter, Aug. F. (See Hambruch, Heinrich F., assignor.)						
Richter, Gustav. (See Majert and Richter.)						
Richwine, Harvy, Dora, Ind. Fence	380,457	Apr. 3	224	61	43	46
Rickard, Daniel H., Washington, D. C. Draft-equaliser	382,336	May 8	671	169	43	646
Rickard, William E. (See Bollick and Rickard.)						
Richards, William T., *et al.* (See Jewell, Crewe, assignor.)						
Ricketson, James M., New Bedford, Mass. Grubbing-pinchers	381,581	Apr. 24	1926	507	43	410
Ricks, Hiram L., Eureka, Cal. Preserving submerged timbers	380,820	Apr. 10	776	212	43	169
Rider, John N. (See Hill and Rider.)						
Riedell, John H., Lynn, assignor to C. F. Brown, trustee, Reading, Mass. Abrading-pad	384,076	June 5	347	98	43	1187
Ries, Elias E., assignor of one-half to A. H. Henderson, Baltimore, Md. Dynamo-electric generator	381,421	Apr. 17	1685	452, 453	43	345
Ries, Elias E., assignor of one-half to A. H. Henderson, Baltimore, Md. Heating by electricity	381,815	Apr. 24	2260	500, 501	43	475
Ries, Elias E., assignor of one-half to A. H. Henderson, Baltimore, Md. Electric heating apparatus for railway-cars	381,816	Apr. 24	2264	501, 502	43	475
Ries, Elias E., assignor of one-half to A. H. Henderson, Baltimore, Md. Electric heating system	381,817	Apr. 24	2271	502, 503	43	476
Ries, Elias E., assignor of one-half to A. H. Henderson, Baltimore, Md. Electro-chemical heating	381,818	Apr. 24	2275	503, 504	43	477
Ries, Elias E., assignor of one-half to A. H. Henderson, Baltimore, Md. Heating railway-cars by electro-chemical means	381,819	Apr. 24	2280	504, 505	43	477
Ries, Elias E., and A. H. Henderson, Baltimore, Md. Underground conduit and grip for electric railways	383,770	May 29	2833	746	43	1091
Ries, George A., Poplar Bluff, Mo. Cloth-cutting machine	381,644	Apr. 24	2016	529	43	488
Riesh, Peter, assignor to L. Wolf Manufacturing Company, Chicago, Ill. Core-arbor for casting carved pipe	381,645	Apr. 24	2017	529	43	488
Rietschy, Charles T., assignor to J. I. Barnhurst, Philadelphia, Pa. Machine for attaching forks to umbrella-stretchers	383,075	May 15	1786	462	43	874
Riexinger, George, Buffalo, N. Y. Child's carriage	382,491	May 8	929	235	43	695
Rigby, Robert M., Kansas City, Mo. Combined book and index	383,543	May 29	2506	661	43	1035
Riggs, William A., Jr., New Orleans, La. Cistern-clamp fastener	381,282	Apr. 17	1483	399	43	304
Rightmire, Harry C., assignor of one-half to T. A. Pearce, Philadelphia, Pa. Reversing mechanism for knitting-machines	385,322	June 26	2223	578	43	1577
Riker, Andrew L., New York, N. Y. Electrical indicator	381,492	Apr. 17	1689	453	43	346
Riker, Andrew L., New York, N. Y. Dynamo-electric machine or motor	384,077	June 5	348	98	43	1187
Riley, Edward, Milwaukee, Wis., assignor of one-half to Milwaukee Harvester Company. Molder's snap-flask	385,903	June 26	2044	523	43	1540
Ringe, Julius, New York, N. Y. Curtain-pole	380,932	Apr. 10	951	258	43	194
Rinman, G. Oscar, and J. Zimmerman, Cincinnati, Ohio; said Rinman assignor to said Zimmerman. Meat-cutting machine	382,192	May 1	457	119	43	598
Ripley, James L., *et al.* (See Langguth, Charles, assignor.)						
Ripley, James R., Memphis, Tenn. Circular sawing machine	381,176	June 5	497	136	43	1217
Ripley, Royal H., Minneapolis, Minn. Stock-car	384,931	June 19	1624	422	43	1446
Rissone, Giovanni B. (See Capra and Rissone.)						
Ritchel, Charles F., Bridgeport, Conn., assignor to J. A. Burke, New York County, N. Y. Lawn-mower	382,388	May 8	771	196	43	986
Ritea, Francis M. (See Westinghouse and Ritea.)						
Ritea, Francis M., assignor to Westinghouse Machine Company, Pittsburg, Pa. Steam-engine	382,322	May 22	2151	568	43	953
Ritter, John L., Milnes, Va. Egg crate and tray	382,632	May 8	1132	292	43	736
Ritter, Wilhelm, Altona, Prussia, Germany. Jointing-machine for barrel-staves	382,340	May 22	2043	536	43	894

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drs.	Official Gazette. Vol.	Official Gazette. Page.
Ritty, Sebastian. (See Thomas and Ritty.)						
Rivers, Thomas L., Newark, N. J. Handle	381,646	Apr. 24	2019	530	43	498
Riverside Iron Works. (See Bray, Thomas J., assignor.)						
Robards, Edward, Stilesville, Ind. Land-measuring machine	382,436	May 8	837	215	43	679
Robb, James T., assignor to Bergmann & Company, New York, N. Y. Insulating-joint	382,272	May 1	577	146	43	339
Robb, Lucian B., Cincinnati, Ohio. Dry closet	384,932	June 19	1625	428	43	1446
Robbins, Fabius. (See Donh and Robbins.)						
Robbins, George M., assignor of two-thirds to H. F. Arms and C. C. Bosher, Worcester, Mass. Car-coupling	383,991	June 5	222	96	43	1164
Robbins, Isaiah, Jr. (See Shawand Buxton, assignors.)						
Roberts, Albert E. (See Baker and Huyck, assignors.)						
Roberts, Benjamin, Indianapolis, Ind. Smoke-condenser	382,665	May 8	1196	311	43	749
Roberts, Cyrus, Three Rivers, Mich. Potato-digger	384,641	June 19	1197	317	43	1365
Roberts, Cyrus, Three Rivers, Mich. Potato-digger	385,071	June 26	1859	475	43	1502
Roberts, David M., Chicago, Ill. Machine for forming and polishing door-panels	384,788	June 19	1412	370 / 371	43	1407
Roberts, Frank E., assignor of one-half to P. M. Kroeck, Austintown, Ohio. Boot-frame for vehicles	380,933	Apr. 10	962	253	43	194
Roberts, Henry, Pittsburg, Pa. Reel for wire-rod mills	382,492	May 8	830	236	43	695
Roberts, Henry, assignor to himself, G. T. Oliver, and A. J. Day, Pittsburg, Pa. Guide for wire-rod mills	381,582	Apr. 24	1927	508	43	410
Roberts, Lorenzo D. (See Tolman, Gayger D., assignor.)						
Roberts, Lorenzo D. (See Tolman and Roberts.)						
Roberts, W. E. (See Stuart, Levi B., assignor.)						
Roberts, William B., Sullivan, Ind. Cultivator, grain-drill, and harrow	382,076	May 15	1789	463	43	674
Robertson, George L. (See Straffin and Robertson.)						
Robertson, John H., New York, N. Y. Car-brake	384,870	June 19	1546	402	43	1431
Robidean, Peter, Plattsburg, N. Y. Machine for cutting box-sections	383,148	May 22	1903	497 / 498	43	986
Robinson, Charles H., St. Paul, Minn. Tube-expander	381,583	Apr. 24	1928	508	43	410
Robinson, Clark, Hartley, Iowa, assignor of one-half to F. A. Burger, St. Paul, Minn. Eraser	383,149	May 22	1906	496	43	907
Robinson, Don C., Madison, Ind., assignor to E. C. Atkins & Company, of Indiana. Saw-jointer	382,327	May 8	672	170	43	646
Robinson, Edward W., Portland, Me. Music-holder	385,010	June 26	1757	454	43	1482
Robinson, Eston J., Toledo, Ohio. Convertible drain-cleaner	385,283	June 26	2174	555	43	1566
Robinson, Francis W., Richmond, Ind. Axle for thrashing-machines	382,009	May 1	198	49	43	548
Robinson, George W., Marshall, Mich. Fire-extinguisher for car-heaters	384,642	June 19	1198	317	43	1365
Robinson, Horace V., Fall River, Mass. Rod-cutter	385,139	June 26	1952	499	43	1521
Robinson, John E., Philadelphia, Pa. Construction of canals, railway-beds, &c	380,934	Apr. 10	953	253	43	194
Robinson, John S., Mannington, assignor to L. G. Robinson, Marion County, W. Va. Saw-guide	381,423	Apr. 17	1690	453	43	348
Robinson, L. G. (See Robinson, John S., assignor.)						
Robinson, Mark H. (See Willams and Robinson.)						
Robinson, Stillman W., Columbus, Ohio. Machine for uniting the soles and uppers of boots or shoes	380,662	Apr. 3	531	147	43	107
Robinson, Theodore D. (See Willis, Ambrose, assignor.)						
Robinson, Thomas, Philadelphia, Pa. Reticulated or open work of metal bars	383,270	May 22	2044	537	43	934
Robison, Charles W. and R. B., Allegheny City, Pa. Vehicle-seat	380,663	Apr. 3	534	147	43	107
Robison, Robert B. (See Robison, Charles W. and R. B.)						
Roby, De Witt C., Eureka, Kans. Hay-rack	382,328	May 8	672	170	43	647
Roche, John. (See Duplessis, Elonild, assignor.)						
Roche, William W., Hampton, Va. Truck	384,078	June 5	349	98	43	1187
Rockenfield, William L. (See Everson, George R., assignor.)						
Rocker Spring Company. (See Bunker, William I., assignor.)						
Rocker Spring Company. (See Stevens, Asher B., assignor.)						
Rockingham Machine Company. (See Fowler and Warren, assignors.)						
Rockwell, Frederick C., *et al.* (See Long, George S., assignor.)						
Rodgers, William H., Whitestone, N. Y. Indicator for boiler-feeds	382,732	May 15	1288	337 / 338	43	776
Rodiger, William, Chicago, Ill. Bottle-closure	385,011	June 26	1757	455	43	1482
Rodiger, William, assignor of one-half to W. H. Redington, Chicago, Ill. Mucilage-bottle	380,458	Apr. 3	225	61	43	46
Roe, Alpheus E., assignor to Tatum & Bowen, San Francisco, Cal. Crushing-mill	380,821	Apr. 10	776	212	43	163
Roe, Alpheus E., assignor of one-half to J. H. Bolles, San Francisco, Cal. Cable-railway grip	381,632	Apr. 10	1107	295 / 296	43	223
Roe, Cyrenius C., Wales, N. Y. Pilot's and engineer's signal for steamboats	380,350	Apr. 3	70	23	43	17
Roesling, Frederich, Cleveland, Ohio. Tobacco-pipe	384,392	June 12	830	216	43	1296
Roessler, Franz, *et al.* (See Rumpf, Gustav, assignor.)						
Rogan, C. W., *et al.* (See Bartlett, Thomas J., assignor.)						
Rogers, Arthur C., and H. Stens, Faribault, Minn. Wheel-fender for carriages	384,335	June 12	746	198	43	1271
Rogers & Brother. (See White, William W., assignor.)						
Rogers, Edmund D., Church End, Finchley, county of Middlesex, England, assignor to P. Wilcox, New York, N. Y. Means for securing stereotype-plates which are cast separately from their beds	381,820	Apr. 24	2287	595	43	479
Rogers, Elias H., Durham, Conn. Pipe-stem	381,170	Apr. 17	1327	354	43	274
Rogers Fence Company. (See Earnest, George H., assignor.)						
Rogers Fence Company. (See Rogers, Timothy, assignor.)						
Rogers, Samuel C., Hamilton, Ontario, Canada, assignor to Hart Emery Wheel Company, (limited.) Saw-filing machine. (Reissue.)	10,937	June 5	579	157	43	1234
Rogers, Timothy, Kenton, assignor to Rogers Fence Company, Springfield, Ohio. Stairway	385,012	June 26	1758	455	43	1482
Rogers, William, Pittsburg, Pa., and W. H. Rogers, Wheeling, W. Va. Manufacture of planished sheet-iron	380,822	Apr. 10	777	213	43	163
Rogers, William H. (See Rogers, William and W. H.)						
Rohde, Peter W., assignor of one-half to Meinera & Schuette, New York, N. Y. Watch-balance	380,709	Apr. 10	704	194	43	149
Rolapp, Otto F. B., Fulton, Ky. Stump-extractor	380,351	Apr. 3	71	23	43	17
Rollings, Winfield S., assignor to R. R. Rouse, Indianapolis, Ind. Chain-wrench	381,494	Apr. 17	1690	453	43	346
Romain, James H. (See Hoffmann, Otto C., assignor.)						
Romer Bros. Manufacturing Co. (See Romer, John P. and N., assignors.)						
Romer, John P. and N., assignors to Romer Bros. Manufacturing Co., Gowanda, N. Y. Saw-gummer	383,191	May 22	1959	513	43	917
Romer, Nicholas. (See Romer, John P. and N.)						
Rood, John, and I. Vaughan, Salem, Mass. Machine for shaving hides or skins	383,914	June 5	104	30	43	1141

Ross, David M. (See Lindsay and Ross.)						
Ross, George and W., Troy, N. Y. Water-engine valve	384,336	June 12	747	196	43	1271
Ross, Josiah, Buffalo, N. Y. Wood-planing machine	385,284	June 26	2175	555	43	1566
Ross, Lester E., St. Paul, Minn., assignor to Ross Loom Company, Nashua, N. H. Shuttle-motion for looms	382,077	May 15	1791	463	43	674
Ross, Levi J., Geodwin, Dak. Ter. Rope-measuring device	381,193	May 1	450	119	43	598
Ross Loom Company. (See Ross, Lester E., assignor.)						
Ross, Samuel A., assignor of one-half to H. R. Barnhurst, Erie, Pa. Pipe expander and cutter	384,080	June 5	352	99	43	1188
Ross, William. (See Ross, George and W.)						
Ross, William, Troy, N. Y. Cylinder for hydraulic motors	382,389	May 8	772	196	43	698
Ross, William S., Madisonville, Ky. Combination implement	384,592	June 12	1123	297	43	1311
Rossman, William P., Hudson, N. Y. Hot-air register for fire-place heaters	381,283	Apr. 17	1483	380	43	304
Rötel, Carl, assignor to Grusonwerk, Magdeburg-Buckau, Prussia, Germany. Breech-loading ordnance	383,378	May 22	2219	569	43	965
Roswald, Raymond F., New York, N. Y. Apparatus for refrigerating and ice-making by the use of ammonia	383,251	May 22	2045	537 / 538 / 539	43	934
Roth, George, Highland, Ill. Machine for liquidizing condensed milk	383,915	June 5	105	31	43	1141
Roth, George, Highland, Ill. Milk-preserving machine	385,013	June 26	1760	455	43	1482
Roth, Julius. (See Kochendorfer and Roth.)						
Rothe, August, New York, assignor, by mesne assignments, to W. W. and C. H. Cotton, Brooklyn, N. Y. Book-index-cutting machine	383,276	May 22	2053	539	43	936
Rothwell, William E., assignor to Warnock & Co., Galt, Ontario, Canada. Fifth-wheel	383,323	May 22	2153	568	43	953
Roubinet, Eli. (See Maury and Roubinet.)						
Roullié, Edmond J., and L. A. Singler, Paris, France. Car-coupling	381,033	Apr. 10	1108	296 / 297	43	224
Rourk, Francis, London, Ontario, Canada. Velocipede	384,643	June 19	1199	317	43	1365
Rouse, Roswell R. (See Rollings, Winfield S., assignor.)						
Rowe, Lewis H., *et al.* (See Kearney, William F., assignor.)						
Rowen, Henry, *et al.* (See Mullica, John and R. F., assignors.)						
Rowland, Charles L., Brooklyn, N. Y. Gas-pressure regulator	384,284	June 12	663	178	43	1257
Rowland, Thomas F., New York, W. E. Hill and A. McLachlan, Brooklyn, N. Y.; said Hill and McLachlan assignors to said Rowland. Cylinder-welding apparatus	384,081	June 5	353	100	43	1188
Rowland, Thomas F., New York, W. E. Hill and A. McLachlan, Brooklyn, N. Y.; said Hill and McLachlan assignors to said Rowland. Cylinder-welding apparatus	384,082	June 5	354	100	43	1189
Rowlett, Jacob V., Richmond, Ind. Lawn-mower	383,829	May 29	2030	774 / 775	43	1110
Rownd, R. M. (See Timms, James, assignor.)						
Royal Machine Manufacturing Company. (See Ilsley, George, assignor.)						
Royce, Henry W., Chicago, Ill. Receptacle for check-slips, &c	382,733	May 15	1290	338	43	776
Royle, John J., Manchester, county of Lancaster, England. Coffee or tea pot	380,521	Apr. 3	326	93, 94	43	67
Ru Tou, Hiram W. (See Gere, Ru Tou, and Kelley.)						
Rubin, Max, New York, N. Y. Fan	382,242	May 1	532	136	43	611
Rudolph, Calvin F. (See Archer, Roger W., assignor.)						
Rudolph, Christian, assignor to K. Oehler, Offenbach, near Frankfort-on-the-Main, Germany. Production of yellow coloring-matter	382,832	May 15	1420	.....	43	802
Rueger, Charles C., Anaconda, Mont. Ter. Ore-concentrator	382,833	May 15	1421	372	43	802
Ruesch, Jacob, Milwaukee, Wis. Lock-up for printers' forms	380,597	Apr. 3	441	124	43	90
Ruffhead, Thomas G., Renovo, Pa. Car-door	382,943	May 1	533	136	43	611
Ruffley, George E. (See Aughenbaugh and Ruffley.)						
Ruffner, Daniel B., *et al.* (See Dunn, William, assignor.)						
Rugg, Datus E., assignor to R. E. Rugg, Albany, N. Y. Music-holder	381,486	Apr. 17	1737	476	43	364
Rugg, Earle L., Woodland, Cal. Astronomical apparatus	384,285	June 12	664	178	43	1257
Rugg, Rittie R. (See Rugg, Datus E., assignor.)						
Ruggles, Daniel, Fredericksburg, Va. Signaling at sea	382,056	May 1	271	.....	43	562
Rumpf, Gustav, Frankfort-on-the-Main, Germany, assignor to F. Roessler and J. Haasbacher, New York, N. Y. Manufacture of chloroform from acetone	383,992	June 5	224	66	43	1164
Rumsey, Albert R. (See Skinner, Thomas, assignor.)						
Rumsey, Charles B., Homer, N. Y. Wire-twisting tool	382,666	May 8	1199	311	43	749
Rumsey, Charles B., assignor to Wire Fabric Company, Homer, N. Y. Bobbin-winding machine	380,352	Apr. 3	72	24	43	17
Runkel, John P., Milwaukee, Wis. Automatic door for elevator-wells	384,083	June 5	356	101	43	1189
Runkle, Benjamin P. (See Platt, William M., assignor.)						
Ruperti, Henri. (See Grätzner and Ruperti.)						
Rush, John, and E. Oldfield, Norwich, Conn. Electric stopping mechanism for looms	384,934	June 19	1627	423	43	1447
Rush, John G., West Willow, Pa. Portable trestle	381,510	Apr. 17	1887	483	43	373
Rushton, John H., Canton, N. Y. Locking steering-gear	383,593	May 29	2561	677	43	1037
Rushton, John H., Canton, N. Y. Boom-fastening	383,594	May 29	2562	678	43	1037
Rushville School Furniture Company. (See Murray, Eli, assignor.)						
Russ, Norman W., London, England. Coin-operated electrical apparatus	382,734	May 15	1292	338 / 339 / 340	43	776
Russell, Robert F., Abilene, Kans. Hame-attachment	384,084	June 5	357	101	43	1189
Russell, Robert F., Abilene, Kans. Hame-tug	384,085	June 5	358	101	43	1189

Scheuer, Simon, New York, N. Y. Shawl-strap	384,395	June 12	833	217	43	1287
Scheurer, Philip H., Nashville, Ill. Hot-air furnace	381,427	Apr. 17	1694	{454 455}	43	847
Schiele & Co., Lewis. (See Keon, Joseph, assignor.)						
Schieren, Charles A., Brooklyn, N. Y. Machine-belting	383,373	May 22	2220	589	43	986
Schiermeyer, Henry W., Daykin, Nebr. Tricycle	380,779	Apr. 10	705	195	43	149
Schiess, Otto, New York, N. Y. Vending apparatus	381,428	Apr. 17	1696	{455 456}	43	847
Schiff, Moritz, New York, N. Y. Combined cane, umbrella, and camp stool	384,790	June 19	1415	371	43	1408
Schildhauer, Joachim, New Holstein, Wis. Willow-bark-stripping machine	380,730	Apr. 10	644	178	43	138
Schiller, Frederick W., assignor of two-thirds to H. H. Petse and G. W. Umbach, Baltimore, Md. Ice-breaker for vessels	384,503	June 12	1184	297	43	1341
Schimper & Co., William. (See Ohlenbusch, Ernest, assignor.)						
Schimper, Frederick, Weehawken, N. J., assignor of one-half to W. M. Schwenker, New York, N. Y. Hose-clamp	382,557	May 8	1033	263	43	717
Schlapp, Herman H., Pueblo, Colo. Desilverizing lead bullion	380,524	Apr. 3	330	94	43	67
Schleiber, Henry H., assignor of one-half to W. W. Quinn, Rochester, N. Y. Wire mat	383,772	May 29	2840	747	43	1092
Schlepegrell, Frederick W., Charleston, S. C. Electrical speed-indicator	380,894	Apr. 10	780	213	43	163
Schlesinger, G., *et al.* (See Marks, Louis, assignor.)						
Schlesinger, William M., Philadelphia, Pa. Trap for electric-railway conduits	381,585	Apr. 24	1923	{509 510}	43	411
Schlicht & Field Company. (See Jewell, M. Rosseyn, assignor.)						
Schlimme, Henry, assignor of one-half to J. H. Grove, Lebanon, Pa. Device for mixing air and gas for furnaces	385,078	June 26	1869	475	43	1502
Schlumberger, Robert, Allegheny, Pa. Soldering-iron	382,558	May 8	1034	263	43	717
Schmick, Charles M. (See Cowden, Reynolds I., assignor.)						
Schmid, Albert, Allegheny, assignor to Westinghouse Electric Company, Pittsburg, Pa. Bobbin for the field-magnets of dynamos	383,657	May 29	2653	703	43	1057
Schmid, Albert, Allegheny, assignor to Westinghouse Electric Company, Pittsburg, Pa. Brush-holder for electric generators	383,658	May 29	2654	703	43	1057
Schmid, Albert, Allegheny, and H. M. Byllesby, assignors to Westinghouse Electric Company, Pittsburg, Pa. Armature for dynamos	383,659	May 29	2655	703	43	1057
Schmid, Charles, assignor of one-half to G. Farnsworth, Chicago, Ill. Steam-engine governor	384,398	June 12	865	178	43	1277
Schmid, Gottlob F., Beardstown, Ill. Feed-cutter	383,494	May 29	2652	644	43	1010
Schmidt, Ferdinand C., Newark, N. J. Traveling-bag	382,771	May 15	1339	358	43	795
Schmidt, Gustave, Cincinnati, Ohio. Hame-tug	383,151	May 22	1907	498	43	907
Schmidt, Gustave, Cincinnati, Ohio. Leather-trimming machine	384,287	June 12	667	179	43	1258
Schmidt, Theodore F. W., assignor of one-half to Laubach & Iddings, Dayton, Ohio. Paper vessel	382,559	May 8	1036	264	43	717
Schmidt, Wilhelm, Halberstadt, Prussia, Germany. Utilising exhaust	381,957	May 1	62	20	43	539
Schmidt, Wilhelm, Halberstadt, Prussia, Germany. Steam-generator	382,235	May 15	1493	376	43	808
Schmuck, Solomon H., assignor of one-half to C. F. Hunger, Cleveland, Ohio. Reclining-chair	380,585	Apr. 3	331	95	43	68
Schneider, Henri, Le Creuzot, France. Tempering steel or steely iron	384,985	June 19	1630	.....	43	1447
Schneider, Henry. (See Weber and Schneider.)						
Schneider, John, New York, N. Y. Electric door-opener	381,725	Apr. 24	2120	500	43	452
Schneider, Max, Doos, near Nuremberg, Bavaria, Germany. Lubricator	381,568	Apr. 24	1936	510	43	412
Schneller, William, New Waterford, Ohio. Mower	380,459	Apr. 3	296	82	43	46
Schoen, Charles T., Philadelphia, Pa. Stake-pocket for cars	381,174	Apr. 17	1331	335	43	875
Schoen, Charles T., Philadelphia, Pa. Die for making stake-pockets for cars	381,175	Apr. 17	1332	356	43	875
Schoessel, Christian A., Rock Island, Ill. Saw-swaging device	381,851	Apr. 24	2235	605	43	488
Scholes, John, Philadelphia, Pa. Machine for making heavy rovings	382,908	May 15	1524	398	43	694
Schopp, Joseph B. (See Pike, Castle, and Schopp.)						
Schott, Joseph S., Burlington, Iowa. Hame-tug	382,058	May 1	274	72	43	562
Schott, William, Brooklyn, N. Y. Surgical knife	380,688	Apr. 10	595	163	43	133
Schreiber, Charles, Methuen, Mass., assignor, by mesne assignments, to Owasco Company, Portland, Me. Apparatus for carbonizing the vegetable matter in wool	380,508	Apr. 3	442	125	43	90
Schreiber, Charles, Methuen, Mass., assignor, by mesne assignments, to Owasco Company, Portland, Me. Carbonizing vegetable matter in wool	380,509	Apr. 3	443	.....	43	90
Schroeder, Emil, San Francisco, Cal. Machine for pulling hair from skins of fur animals	382,736	May 15	1296	{340 341}	43	777
Schroeder, Max. (See Hänisch and Schroeder.)						
Schuchman, Andrew, Springfield, Ill. Electric fire and burglar alarm	381,862	Apr. 24	2336	606	43	489
Schuchman, John P., Owensville, Mo. Pump and windmill head	384,086	June 5	558	101	43	1180
Schultze, Augusta, New York, N. Y. Eyeglasses	384,475	June 12	938	244	43	1302
Schulz, Richard, Tessel, near Berlin, Germany. Hoisting machinery	380,637	Apr. 3	490	137	43	109
Schulze-Berge, Herman, *et al.* (See Niemstädt, Ernst, assignor.)						
Schumacher, Emil M., West View, Pa. Hen's nest	380,809	Apr. 10	595	163	43	133
Schumann, Charles B., South Norwalk, Conn. Combined extension-ladder, fire-escape, and hose-carriage	381,587	Apr. 24	1938	{510 511}	43	412
Schumann, Charles B., South Norwalk, Conn. Flexible ladder	381,853	Apr. 24	2237	606	43	489
Schumpe, Friedrich, assignor of one-half to J. M. Hammelrath, Cincinnati, Ohio. Washing-machine	380,938	Apr. 10	960	255	43	196
Schutte, Louis, Philadelphia, Pa. Check-valve	380,940	Apr. 10	961	255	43	196
Schutte, Louis, Philadelphia, Pa. Device for operating valves and other mechanisms	380,941	Apr. 10	962	256	43	196
Schuyler Electric Company. (See Mott, Samuel D., assignor.)						
Schwamm, Leonhard T., Cleveland, Ohio. Portable stock-cooler	381,438	Apr. 17	1700	457	43	350
Schwartz, Jacob, Portland, Oreg. Dentifrice	380,700	Apr. 10	596	.....	43	133
Schweek, Samuel Z., Pottstown, Pa. Lifting-jack	382,194	May 1	460	119	43	596
Schwenker, William M. (See Schimper, Frederick, assignor.)						
Schwerdfeger, Charles H., *et al.* (See Beasling, Henry F., assignor.)						
Seefeld, Levi, assignor to Challenge Corn Planter Company, Grand Haven, Mich. Drill attachment for planters	383,994	June 5	227	67	43	1165
Seales, Jordan J. D. (See Warner and Seales.)						
Scott, Alexander, guardian. (See Scott, William H.)						
Scott, Edward, Cedarville, Ark. Wagon-step	381,498	Apr. 17	1700	456	43	349
Scott, James, Brockville, Ontario, Canada. Car-coupling	384,474	June 19	936	242	44	1307
Scott, Walter S., Fort Meade, Dak. Ter. Pipe, tube, or shell extractor	384,791	June 19	1416	372	43	1408
Scott, William, Malden, Mass. Operating-lever for valves, &c	384,687	June 5	359	102	43	1159
Scott, William H., minor, A. Scott, guardian, assignor of one-half to D. C. Reinoil, Washington, D. C. Box	381,889	Apr. 24	2300	621	43	500
Scott, William J. (See Mann, Edgar E., assignor.)						
Scott, William M., Cambridge, Vt. Hoisting railway-cars	381,647	Apr. 24	2021	530	43	429
Seargal, Angus, Hickory Corners, Mich. Vent-stopper for pumps	383,773	May 29	2841	747	43	1093

Scovill Manufacturing Company. (See Flammang, Mathias, assignor.)						
Scovill Manufacturing Company. (See Rust, Theodore S., assignor.)						
Scovill Manufacturing Company. (See Shipley, Alfred J., assignor.)						
Scoville, Elijah U., Manlius, N. Y. Faucet	383,995	June 5	230	67	43	1165
Scribner, Charles E., assignor to Western Electric Company, Chicago, Ill. Circuit for double-stranded telephone-switch-board cords	382,909	May 15	1525	399	43	894
Scribner, Charles E., assignor to Western Electric Company, Chicago, Ill. Long-distance connection for multiple switch-boards	381,430	Apr. 17	1702	456	43	349
Scribner, Charles E., assignor to Western Electric Company, Chicago, Ill. Telephone-exchange system	381,431	Apr. 17	1704	457	43	349
Scribner, Charles E., assignor to Western Electric Company, Chicago, Ill. Switch-board	383,013	May 15	1689	{439 440	{43	854
Scribner, Charles E., assignor to Western Electric Company, Chicago, Ill. Clearing-out annunciator	383,014	May 15	1693	440	43	855
Scribner, Charles E., assignor to Western Electric Company, Chicago, Ill. Automatic shunt for magneto-generators	383,015	May 15	1694	440	43	856
Scribner, Charles E., assignor to Western Electric Company, Chicago, Ill. Test-circuit for telephone call-boxes	383,016	May 15	1695	440	43	856
Scribner, Charles E., assignor to Western Electric Company, Chicago, Ill. Key-board apparatus for telephone-exchanges	383,017	May 15	1696	441	43	856
Scribner, Charles E., assignor to Western Electric Company, Chicago, Ill. Test-circuits for multiple switch-boards	383,018	May 15	1697	441	43	856
Scribner, Charles E., assignor to Western Electric Company, Chicago, Ill. Electric annunciator	383,495	May 29	2427	{644 645	{43	1010
Scribner, Charles E., assignor to Western Electric Company, Chicago, Ill. Police electric signal system	384,088	June 5	361	102	43	1190
Scribner, Charles E., assignor to Western Electric Company, Chicago, Ill. Multiple switch-board circuit	384,476	June 12	938	244	43	1308
Scribner, Charles E., assignor to Western Electric Company, Chicago, Ill. Multiple switch-board-testing apparatus	384,477	June 12	940	244	43	1308
Scribner, Charles E., assignor to Western Electric Company, Chicago, Ill. Test system for multiple switch-boards	384,644	June 19	1200	317	43	1365
Scribner, G. Hilton, and W. Heckert, Yonkers, N. Y. Steam-engine	385,205	June 26	2047	523	43	1541
Seal, William B., assignor to W. S. Reina, Baltimore, Md. Car-coupling	381,854	Apr. 24	2338	{606 607	{43	489
Seaman, Alfred S. (See Andrews, Edward, assignor.)	381,648	Apr. 24	2022	530	43	429
Seaman, Frederick W., Sheffield, county of York, England. Ingot or bar for tools	383,192	May 22	1960	514	43	917
Search, Casper F., assignor to Winona Harvester Works, Winona, Minn. Platform-adjustment for harvesters	383,660	May 29	2656	{704 705	{43	1058
Sears, John F., Clifton, Ontario, Canada and H. E. Kelley, Niagara Falls, assignors to Oneida Community, (limited,) Community, N. Y. Chain-fastener	381,855	Apr. 24	2341	607	43	489
Sears, William (See Bailey, Elmer E., assignor.)						
Sears, William N., assignor of one-half to M. V. B. Holmes, Wellington, Kans. Nut-lock	380,526	Apr. 3	332	95	43	68
Sedgwick, Frederick, Chicago, Ill. Mainspring for watches	381,176	Apr. 17	1333	356	43	275
Seel, Carl, Berlin, Germany. Electric-lamp filament	384,288	June 12	669	179	43	1258
Seeley, Marquis F., Fremont, Nebr. Elevator-boot	382,560	May 8	1037	284	43	718
Sefton, William E., Canton, Ohio. Rolling colter	382,772	May 15	1340	359	43	785
Segar, Charles T., Utica, N. Y. Folding cot	382,737	May 15	1299	341	43	777
Segerdahl, Rudolph. (See Gill and Segerdahl.)	381,433	Apr. 17	1707	457	43	350
Segschneider, Gustave, assignor to Waring Hat Manufacturing Company, Yonkers, N. Y. Pile-wire for looms						
Seibert, Antony, Rock Rift, N. Y. Machine for delinting cotton-seed	383,545	May 29	2508	662	43	1025
Seifert, Oswald, San Francisco, Cal. Rotary pump	383,374	May 22	2221	590	43	966
Seimel, Conrad, Brooklyn, N. Y. Can-filling machine	383,996	June 5	230	67	43	1166
Seitz, Nathaniel Z. (See Miller and Seitz.)	383,595	May 29	2562	678	43	1037
Seitz, Nathaniel Z., Washington, D. C., assignor to Kohler Improved Cattle Car Company, New York, N. Y. Stock-car	380,600	Apr. 3	445	125	43	90
Seitz, Nathaniel Z., Glen Rock, Pa., assignor to Shellabarger Live-Stock Car Company, Washington, D. C. Stock-car	380,638	Apr. 3	491	138	43	100
Selby, James, Peoria, Ill. Corn-planter	381,588	Apr. 24	1942	{511 512	{43	413
Selby, Prentiss, Oakland, Cal. Wad-printing machine	382,441	May 8	848	{216 217	{43	680
Selby, Prentiss, Oakland, Cal. Cartridge-loading machine	384,089	June 5	362	102	43	1190
Selden, Charles, Baltimore, Md. Telegraph-receiver	382,195	May 1	461	119	43	580
Sellon, John S., Hatton Gardens, county of Middlesex, England, assignor to Electrical Accumulator Company, of New York. Automatic switch for secondary batteries	385,324	June 26	2237	573	43	1578
Sellon, John S., Hatton Gardens, county of Middlesex, England, assignor to Electrical Accumulator Company, of New York. Automatic switch for secondary batteries	382,112	May 1	350	92	43	578
Sellon, John S., Sydenham, county of Kent, England, assignor to Electrical Accumulator Company, of New York. Secondary battery	384,289	June 12	671	{179 180	{43	1258
Seltzer, Van S. (See Bending, William P., assignor.)	383,193	May 22	1961	514	43	917
Semmes, Raphael T., Atlanta, Ga. Back-band buckle	385,206	June 26	2049	523	43	1541
Semple, Harry, Hamilton, Ontario, Canada. Machine for finishing bottle-necks	384,290	June 12	673	180	43	1259
Sergeson, James C., Philadelphia, Pa. Loom-shuttle	383,774	May 29	2642	747	43	1093
Servus, Ferdinand, Berlin, Germany. Picture-frame support	380,671	Apr. 3	550	{150 151	{43	111
Sessions, Henry H., Pullman, assignor to Pullman's Palace Car Company, Chicago, Ill. Equalizer for car-vestibules	383,619	May 15	1608	441	43	857
Severance, James R., Fremont, Ohio, assignor of two-thirds to W. D. Baldwin, Montclair, N. J., and J. C. Adsett, Hornellsville, N. Y. Knot-tying mechanism for grain-binders	382,773	May 15	1341	{353 354	{43	786
Severin, William, Chicago, Ill. Printer's standing-galley	385,144	June 26	1959	501	43	1523
Seymour, Dudley S. (See Pope, Harry M., assignor.)						
Seymour, Frederick J., Findlay, Ohio. Furnace for reducing aluminum	382,196	May 1	464	120	43	580
Seymour, Frederick J., Findlay, Ohio. Obtaining alumina from clay	382,273	May 1	576	146	43	609
Seymour, Frederick J., Findlay, Ohio, assignor to American Aluminum Company, Detroit, Mich. Obtaining alumina from clay	382,197	May 1	467	.....	43	580
Seymour, Frederick J., Findlay, Ohio, assignor to American Aluminum Company, Detroit, Mich. Purification and alloying of copper	382,198	May 1	467	.....	43	580
Seymour, Henry A., Washington, D. C., assignor to Brush Electric Company, Cleveland, Ohio. System of electric locomotion	384,394	June 12	1135	297	43	1341

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drgs.	Official Gazette. Vol.	Official Gazette. Page.
Seymour, James A., Auburn, N. Y. Combined relief-valve and cylinder-cock	382,339	May 8	674	170	43	647
Seymour, John, *et al.* (See Brougher, David J., assignor.)						
Shafer, George W. (See Shafer, William F. and G. W.)						
Shafer, William F. and G. W., Rich Hill, Mo. Baling-press	385,207	June 26	2050	524	43	1741
Shafer, Abraham and G. M., Cassopolis, Mich. Gang-plow	383,496	May 29	2429	645	43	1011
Shaffer, George H. (See Meit, Charles S., assignor.)						
Shaffer, George M. (See Shaffer, Abraham and G. M.)						
Shaffer, Simon B., Ekalaka, assignor to himself and H. E. Gibb, Miles City, Mont. Ter. Spoke-auger	380,701	Apr. 10	597	164	43	196
Shallenberger, Oliver B. (See Bylleshy and Shallenberger.)						
Shallenberger, Oliver B., Rochester, assignor to G. Westinghouse, Jr., Pittsburg, Pa. Electric indicator	380,942	Apr. 10	963	256	43	196
Shallenberger, Oliver B., Rochester, assignor to G. Westinghouse, Jr., Pittsburg, Pa. Circuit-controlling apparatus for electric-lighting circuits	383,661	May 29	2660	705	43	1058
Shallenberger, Oliver B., Rochester, assignor to Westinghouse Electric Company, Pittsburg, Pa. Volt-ammeter	380,943	Apr. 10	965	256	43	197
Shallenberger, Oliver B., Rochester, assignor to Westinghouse Electric Company, Pittsburg, Pa. Electrical pressure-indicator	380,944	Apr. 10	965	256	43	197
Shallenberger, Oliver B., Rochester, assignor to Westinghouse Electric Company, Pittsburg, Pa. Adjustable inductive resistance	380,945	Apr. 10	967	257	43	197
Shallenberger, Oliver B., Rochester, assignor to Westinghouse Electric Company, Pittsburg, Pa. Electrical indicator	380,947	Apr. 10	970	257	43	198
Shallenberger, Oliver B., Rochester, assignor to Westinghouse Electric Company, Pittsburg, Pa. Coupling of alternate-electric-current generators	383,662	May 29	2661	705	43	1059
Shallenberger, Oliver B., Rochester, assignor to Westinghouse Electric Company, Pittsburg, Pa. Armature for dynamos	383,663	May 29	2662	706	43	1059
Shallenberger, Oliver B., Rochester, assignor to Westinghouse Electric Company, Pittsburg, Pa. Armature for electric machines	383,664	May 29	2663	706	43	1059
Shallenberger, Oliver B., Rochester, assignor to Westinghouse Electric Company, Pittsburg, Pa. Indicator for electric currents	383,665	May 29	2663	706	43	1059
Shallenberger, Oliver B., Rochester, assignor to Westinghouse Electric Company, Pittsburg, Pa. Apparatus for detecting ground-connections in electric circuits	383,666	May 29	2665	706	43	1060
Shallenberger, Oliver B., Rochester, assignor to Westinghouse Electric Company, Pittsburg, Pa. Indicating electric currents	383,667	May 29	2666	707	43	1060
Shallenberger, Oliver B., Rochester, assignor to Westinghouse Electric Company, Pittsburg, Pa. Electrical indicator for alternating electric currents	383,668	May 29	2667	707	43	1060
Shallenberger, Oliver B., Rochester, assignor to Westinghouse Electric Company, Pittsburg, Pa. Electrical indicator	383,669	May 29	2669	707	43	1061
Shallenberger, Oliver B., Rochester, assignor to Westinghouse Electric Company, Pittsburg, Pa. Electrical indicator	383,670	May 29	2671	707	43	1061
Shallenberger, Oliver B., Rochester, assignor to Westinghouse Electric Company, Pittsburg, Pa. Electrical indicator	383,671	May 29	2673	708	43	1061
Shallenberger, Oliver B., Rochester, assignor to Westinghouse Electric Company, Pittsburg, Pa. Indicating electric currents	383,672	May 29	2675	708	43	1062
Shallenberger, Oliver B., Rochester, and H. M. Bylleshy, assignors to Westinghouse Electric Company, Pittsburg, Pa. Central station for alternate-current systems of electrical distribution	380,946	Apr. 10	968	257	43	197
Shaner, Maconius, Beaver Falls, Pa. Belting-reel	380,567	Apr. 3	333	95	43	68
Shank, James, Clayton, Ill. Cultivator	380,948	Apr. 10	972	258	43	198
Shannon, Oscar M., Chicago, Ill. Clothes-drier	380,949	Apr. 10	973	258	43	198
Shanta, Abram B., Sliters, N. Y. Potato-digger	380,771	Apr. 10	706	195	43	150
Sharer, George W., Terre Haute, Ind. Drier	385,208	June 26	2051	{524 525 526 527	{43	1542
Sharer, George W., Terre Haute, Ind. Brick-kiln	385,209	June 26	2053			
Sharp, Asa C. (See McMahon, Sharp, and Liles.)						
Sharp, Christopher C., Indianapolis, Ind. Inhaler	382,113	May 1	351	92	43	578
Sharp, James L., New York, N. Y. Gas-stove	380,355	Apr. 3	79	25	43	18
Sharp, James L., New York, and J. D. Luther, Brooklyn, N. Y. Sad-iron	381,434	Apr. 17	1708	458	43	350
Sharp, John H., Columbus, N. J. Sand-band for vehicle-axles	380,538	Apr. 3	334	96	43	68
Sharpe, John, assignor of one-half to J. A. Banfield, Toronto, Ontario, Canada. Combined latch and lock	381,435	Apr. 17	1709	458	43	350
Shaver Corporation. (See Shaver, George F., assignor.)						
Shaver, George F., assignor, by mesne assignments, to Shaver Corporation, New York, N. Y. Mechanical telephone	383,324	May 22	2154	569	43	954
Shaver, Sebern R. (See Wright and Shaver.)						
Shaw, Charles A., Boston, Mass., and L. W. Buxton; said Shaw assignor to said Buxton and I. Robbins, Jr., Nashua, N. H. Coffee-filter	383,916	June 5	106	31	43	1141
Shaw, T. Jackson, Wilmington, Del., and J. M. Spiegle, Philadelphia, Pa., assignors to Boston Tow Boat Company, Boston, Mass. Towing-machine	383,917	June 5	107	31	43	1141
Shaw, Thomas, Philadelphia, Pa. Signaling apparatus	381,792	June 19	1418	372	43	1406
Shay, James L., assignor of one-half to C. E. Thompson, Bridgeport, Conn. Ticket-clasp	382,274	May 1	580	147	43	630
Shea, Albert, Boston, Mass. Button-piece for boots or shoes	380,731	Apr. 10	645	178	43	138
Shea, Albert, assignor of one-half to F. A. Shea, Boston, Mass. Lemon-squeezer	382,774	May 15	1347	354	43	787
Shea, Francis A. (See Shea, Albert, assignor.)						
Shearer, Brent, West Point, Miss. Sad-iron and plate-holder	384,723	June 19	1323	345	43	1308
Sheeley, Robert S., Galesburg, Ill. Vaporizer	382,636	May 15	1424	374	43	883
Sheets, Alfred T., Germany, assignor of one-half to Birdsell Manufacturing Company, South Bend, Ind. Clover-huller	381,687	Apr. 17	1788	476	43	364
Sheibley, Henry W. (See Brown, William, assignor.)						
Sheldon, C. E. (See Frost, John B., assignor.)						
Shell, John W., Evening Shade, Ark. Last collecting and compacting apparatus	382,775	May 15	1348	354	43	787
Shellabarger Live-Stock Car Company. (See Seitz, Nathaniel Z., assignor.)						
Shelley, George E., Butler, Ky. Fence	380,539	Apr. 3	335	96	43	68
Shenfield, Abraham. (See Voorhis, Calvin, assignor.)						
Shepard, Charles G., *et al.* (See Condon, Shepard, and Adams.)						
Shepard, Lewis, Mace, Ind. Farm-gate	383,676	May 15	1792	464	43	675
Shepard, Vinton R., Covington, Ky. Passenger-ticket	384,291	June 12	674	180	43	1259
Shepard, Walter J. (See Condon, Shepard, and Adams, assignors.)						
Shepard, William T., *et al.* (See Henry, John, assignor.)						
Shepherd, Augustus, Hennepin, Ill. Piano-gate	381,793	June 19	1420	372	43	1406
Shepherd, Charles H., New York, N. Y. Valve mechanism for sewerage systems	384,396	June 12	834	217	43	1267
Shepherd, Charles H., New York, N. Y. Valve mechanism for sewerage systems	384,397	June 12	835	218	43	1268
Shepherd, Thomas W., Peabody, Mass. Metallic thermometer	382,561	May 6	1038	264	43	718

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drgs.	Official Gazette. Vol.	Official Gazette. Page.
Sheridan, James, assignor to Pettee Machine Works, Newton, Mass. Evener for railway-heads	381,284	Apr. 17	1484	{389 400}	43	395
Sherington, John A., New York, N. Y. Slatted blind	381,649	Apr. 24	2024	531	43	489
Sherman, Cornelius A., *et al.* (See Thompson, Elias H., assignor.)						
Sherman, Eugene A., Plover, Wis. Ladder	382,114	May 1	358	93	43	579
Sherman, Gardiner M., Springfield, Mass. Vaporizer	384,794	June 19	1423	373	43	1409
Sherman, Lewis, Milwaukee, Wis. Triturator	383,030	May 15	1699	442	43	997
Sherman, Wardell B., deceased, Oneida, N. Y.; M. E. and C. G. Foland administrators. Railway-signal	381,086	Apr. 10	1902	392	43	242
Sherman, Willis S., Marinette, Wis. Pneumatic dental plugger	383,152	May 22	1908	400	43	997
Shertzer, John W. (See Young and Shertzer.)						
Sherwood, Alexander B., Chicago, Ill. Paper-file	381,959	May 1	85	21	43	831

Whiteman, Abraham V. (See Carll, George L., assignor.)						
Whiting, Louis R., Fort Worth, assignor of one-fourth to A. Muckle, Bobbin, Tex. Machine for shucking and shelling corn	382,285	May 1	602	159	43	623
Whiting, Preston, H., assignor of one-half to H. Malmberg, Cortland, N. Y. Vehicle-spring	385,334	June 26	2255	577	43	1561
Whitman & Barnes Manufacturing Company of Ohio. (See White, Harvey, assignor.)						
Whitman, Walter W. (See Henry, James F., assignor.)						
Whitman, William E., Winthrop, Me. Feed-cutter	380,966	Apr. 10	1003	257	43	884
Whitson, Robert J., Chicago, Ill. Alarm-bell	382,343	May 8	698	175	43	651
Whittaker, Ellen V. (See Whittaker, Victor H., assignor.)						
Whittaker, Victor H., Bradford, assignor to himself and E. V. Whittaker, Gloucester, Mass. Rounding-out machine	384,807	June 19	1440	377	43	1412
Whittaker, William, Burnley, county of Lancaster, England. Mechanical stoker	384,486	June 12	954	247	43	1310
Whitteck, Paul, Butler, N. J. Automatic weighing-scale for liquids	382,849	May 15	1441	379	43	807
Whittier, Thomas P., East Saginaw, Mich. Galvanic-battery excitant	383,263	May 22	2073	544	43	939
Whittingham, Alfred C., Toledo, Ohio. Combined necktie and collar-button	383,929	June 5	133	38	43	1146
Wick, George C. (See Wick, Ole E. and G. C.)						
Wick, Ole E. and G. C., Humboldt Park, Ill. Combined desk and organ	385,071	June 26	1786	461	43	1488
Widman, Henry A., Jr., St. Louis, Mo. Carpet-cleaner and dust-conveyer	383,422	May 22	2303	611	43	979
Wiecking, Christian W., Jr., Walhalla, S. C. Car-heater	381,490	Apr. 17	1792	477	43	365
Wiederer, Peter, Stapleton, N. Y. Folding mirror	381,452	Apr. 17	1740	465	43	355
Wiederer, Peter, Stapleton, N. Y. Mirror	384,808	June 19	1442	378	43	1413
Wiederer, Peter, Stapleton, N. Y. Folding mirror	384,809	June 19	1443	378	43	1413
Wiedling, Carl T. A. H., New York, N. Y., assignor to J. S. Connelly, Plainfield, N. J., and T. E. Connelly, Brooklyn, N. Y. Device for transmitting power	384,598	June 12	1132	298 299	43	1313
Wien, Julius, assignor of one-third to J. R. Wiggins, Chicago, Ill. Hinge	385,156	June 26	1976	506	43	1527
Wier, Stephen M., New Haven, Conn. Reach-coupling for vehicles	380,541	Apr. 3	354	101	43	72
Wiestner, John H., Philadelphia, Pa. Split-hoof clamp for horses	381,868	Apr. 24	2359	612	43	493
Wiggins, Fred B. (See Farrar, Cyrus S., assignor.)						
Wiggins, James R. (See Wien, Julius, assignor.)						
Wiggins, Ransome H., New Salem, Tex. Elevator for cotton-cleaning machines	383,264	May 22	2074	544	43	939
Wight Fire Proofing Company. (See Wight, Peter B., assignor.)						
Wight, Peter B., Hyde Park, Ill., assignor to Wight Fire Proofing Company, of Illinois. Fire-proof ceiling	384,947	June 19	1648	428	43	1451
Wightman, Merle J. (See Lemp and Wightman.)						
Wilbur, George E. (See Walker and Wilbur.)						
Wilbur, John E., Rochester, N. Y. Lamp-stove	382,579	May 8	1671	274	43	724
Wilby, Richard, Mirfield, county of York, England. Apparatus for controlling the speed of steam-engines	382,577	May 8	1067	272 273	43	723
Wilcke, Julius C. (See Tilgner and Wilcke.)						
Wilcox, Darius, Derby, assignor to Wilcox & Howe, Birmingham, Conn. Wagon-spring	381,309	Apr. 17	1515	409	43	311
Wilcox, Edward B., *et al.* (See Kelly, Wallace C., assignor.)						
Wilcox & Howe. (See Wilcox, Darius, assignor.)						
Wilcox, Paul. (See Rogers, Edmund D., assignor.)						
Wilcox, Robert, London, England. Feathering-propeller	380,967	Apr. 10	1003	258 259	43	884
Wilcox, Stephen, Brooklyn, N. Y. Valve mechanism for engines	382,578	May 8	1069	273 274	43	724
Wilcox, William W., Middletown, Conn. Sail-grommet	382,921	May 15	1542	404	43	827
Wilcox, William W., Middletown, Conn. Sail-grommet	382,922	May 15	1542	404	43	828
Wilcox, William W., Middletown, Conn. Sail-grommet	382,923	May 15	1543	404	43	828
Wilcox, William W., Middletown, Conn. Punch and die for sail-grommets, &c.	382,924	May 15	1544	405	43	828
Wilder, Charles O., South Bend, Ind., assignor to Williams, White & Co., Moline, Ill. Machine for forming eyes on rods	383,084	May 15	1608	471	43	877
Wildt, Edward A., Long Island City, N. Y. Electric battery	383,548	May 29	2512	663	43	1025
Wiles, Robert H., *et al.* (See Devore, Levi M., assignor.)						
Wiles, Thomas S., Albany, N. Y. Ironing-machine	384,487	June 12	955	248 249	43	1311
Wiley, Edgar C., Independence, Va. Hillside cultivator	383,697	May 29	2576	682	43	1040
Wiley, John, assignor of one-half to H. B. Eaton, Fitchburg, Mass. Band-pulley	382,448	May 8	859	219	43	682
Wiley, William H., Stockton, Kans. Grapple	384,107	June 5	384	108	43	1194
Wiley, William J. (See Sprague and Wiley.)						
Wilkening, Gottlieb, Dayton, Ohio. Slate-eraser	382,925	May 15	1544	405	43	828
Wilkin, George, Dundee, N. Y. Berry-harvester	382,745	May 15	1508	343	43	779
Wilkins, Alexander G., assignor of one-half to A. L. Dunbar, Meadville, Pa. Button-setting machine	381,310	Apr. 17	1517	408 410	43	311
Wilkins, James S., Jr., Keene, N. H. Toy locomotive	384,658	June 19	1290	322	43	1369
Wilkins, Morris D., assignor to himself and J. J. West, Chicago, Ill. Printing	385,091	June 26	1869	477	43	1504
Wilkinson, George, and J. McCourt, Acampo, Cal. Earth-scraper	380,374	Apr. 3	105	31	43	23
Wilkins, Peter W., Thames Ditton, and M. H. Robinson, Kingston-on-Thames, county of Surrey, England. High-speed engine	380,375	Apr. 3	106	31	43	23
Willard, Bradford, *et al.* (See Stilwell, Rickason, assignor.)						
Willcox, Alfred B., and E. Norton, Maywood, assignors to said Norton and O. W. Norton, Chicago, Ill. Machine for soldering side seams of cans	382,344	May 8	689	176	43	652
Willey, Lewis B., Pawaano, Mich. Sheaf-carrier	380,968	Apr. 10	1005	259	43	884
Williams, Carmi H., New York, N. Y. Machine for making timber-hangers	383,265	May 22	2075	545	43	939
Williams, Charles K., Newark, N. Y. Coin-controlled height-measuring machine	383,608	May 29	2577	683	43	1040
Williams Company, John R. (See Williams, John R., assignor.)						
Williams, David. (See Walker and Williams.)						
Williams, David A., Denver, Colo. Dumping-wagon	383,930	June 5	134	39	43	1146
Williams, Edwin F., Chicago, Ill. Valve	384,883	June 19	1566	407	43	1434
Williams, Frank, Holyoke, Mass. Renewing strainer-plates for paper-machines	381,737	Apr. 24	2152	563	43	455
Williams, Frank A., Albrighton, county of Salop, England. Tube-coupling	381,869	Apr. 24	2360	612	43	493
Williams, Frank F., *et al.* (See Williams, John G., assignor.)						
Williams, Frank R., Rochester, N. Y. Apple-parer	381,044	Apr. 10	1124	302	43	927
Williams, Frederick, Alexandra, New Zealand. Automatic wool-washing machine	380,470	Apr. 3	241	65	43	49
Williams, George B., La Crosse, Wis. Triple valve for air-brakes	384,009	June 5	947	71	43	1169
Williams, Hamilton W., Nashville, Tenn. Device for side-dressing the teeth of saws	383,931	June 5	135	39	43	1147
